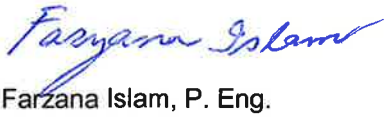
- Groundwater samples were collected from the four (4) offsite monitoring wells (TH9, TH100, TH101 and TH102) on October 6, 2014. The groundwater samples were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, MTBE, Hexane and lead. The analytical results of the submitted groundwater samples were reported by EXP to be above the selected MOE Table 3 SCS for concentrations of one or more of PHC F1-F3 with the exception of the sample collected from TH100, which satisfied the selected MOE Table 3 SCS.

The October 2014 groundwater monitoring report provides the following information:

- Seven (7) onsite monitoring wells (TH1 through TH7) were monitored on August 26, 2014 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH).
- EXP selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
- The depth to groundwater ranged from 3.03 mbgs (in TH4) to 4.05 mbgs (in TH7). The groundwater flow direction was interpreted to be southeasterly.
- Headspace vapour concentrations ranged from non-detect (at various locations) to 30% lower explosive limit of hexane (LEL) (in TH4).
- LPH was not detected in any monitoring wells.
- Groundwater samples were collected from the seven (7) onsite monitoring wells (TH1 through TH7) on August 26-27, 2014. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by EXP to be below the selected MOE Table 3 SCS for all analyzed parameters with the exception of the samples collected from TH3, TH4, TH5 and TH7, which exceeded for concentrations of one or more of benzene, and/or PHC F1-F2.



The April 2015 Contaminant Management Plan (CMP) proposes the following:

- On an annual basis, the onsite monitoring wells (TH1 to TH7) and the offsite monitoring wells (TH8 to TH12 and TH100 to TH102) will be monitored for depth to groundwater, subsurface vapour concentrations and presence or absence of LPH.
- On an annual basis, the onsite monitoring wells (TH1 to TH7) and the offsite monitoring wells (TH8 to TH12 and TH100 to TH102) will be sampled for BTEX and PHC F1-F4.
- On an annual basis, a report summarizing the findings from the onsite monitoring wells will be submitted to the TSSA.
- On an annual basis, a report summarizing the findings from the offsite monitoring wells will be submitted to the TSSA and the City of Ottawa (the City). TSSA will be copied on all correspondence with the municipality.
- Up to three additional test holes are to be installed to further delineate the offsite ground water impacts to the north and east of the subject property. The completion of this work will depend on the access permission from the third party.
- Up to two additional test holes are to be installed to further delineate the ground water impacts to the south of TH7. The completion of this work has been planned for 2015.

Our review of the information provided in the 2014 reports indicates that the petroleum hydrocarbon (PHC) impacts identified in groundwater at the locations of onsite monitoring well TH7 and at the locations of offsite monitoring wells TH9, TH101 and TH102 have not been completely delineated. We understand that further groundwater impact delineation work was planned to be completed in 2015. The delineation work on the City of Ottawa's right-of-way is pending the access permission and the City's concurrence to the offsite CMP proposal. We understand that additional investigation and further groundwater monitoring program was carried out at the site in 2015, 2016 and in 2017. Our comments will be provided under a separate letter that will follow.

Should you have any further questions, please do not hesitate to contact me directly.

Yours truly,

Groundwater Monitoring Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Mr. Koo,

Thank you for submitting the following reports:

- *"2015 Supplemental Subsurface, Groundwater Monitoring and Sampling Investigation, 1660 Merivale Road, Ottawa, Ontario"*, prepared by Golder Associates Ltd. (Golder), dated May 6, 2016;
- *"2016 Groundwater Monitoring and Sampling Report, Adjacent to 1660 Merivale Road, Ottawa, ON"*, prepared by Golder, dated November 21, 2016; and
- *"2016 Groundwater Monitoring and Sampling Report, Former Imperial Oil Retail Fuel Outlet, 1660 Merivale Road, Ottawa, ON"*, prepared by Golder, dated January 31, 2017.

The May 2016 subsurface investigation report provides the following information:

- Two (2) boreholes (MW15-01 and MW15-02) were advanced to depths 6.0 metres below ground surface (mbgs) and 4.9 mbgs, respectively on September 9, 2015. Both the boreholes were completed as monitoring wells MW15-01 and MW15-02.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Four (4) soil samples (recovered from the boreholes) were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, n-Hexane and lead. The analytical results of the submitted soil samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters
- The two (2) newly installed monitoring wells (MW15-01 and MW15-02) and seven (7) onsite monitoring wells (TH1 through TH7) were monitored on November 17, 2015 for depth to groundwater, petroleum vapour concentrations and presence or absence of LPH.
- The depth to groundwater measured in the monitoring wells ranged from 2.41 mbgs (in MW15-01) to 3.94 mbgs (TH6). The groundwater flow direction is to the south.
- Headspace vapour concentrations measured in the monitoring wells ranged from 5 ppm (in TH2) to 1250 ppm (in TH6). LPH was not detected in any monitoring wells.
- Groundwater samples were collected from the two (2) newly installed monitoring wells (MW15-01 and MW15-02) and seven (7) onsite monitoring wells (TH1 through TH7) on October 28, 2015 or on November 17, 2017. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). The groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), n-Hexane and lead.

- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the samples collected from TH4, TH5 and TH7 and MW15-02 which exceeded for PHC F1-F2.

The November 2016 Offsite groundwater monitoring report provides the following information:

- Eight (8) offsite monitoring wells (TH8, TH9, TH10, TH11, TH12, TH100, TH101 and TH102) were monitored on August 10, 2016 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH). Golder reports that the monitoring well TH10 was decommissioned on August 24, 2016, and was replaced with a newly installed monitoring well MW16-01.
- The depth to groundwater measured in the monitoring wells ranged from 2.88 metres below ground surface (mbgs) (in TH12) to 3.68 mbgs (in TH9). The groundwater flow direction was not interpreted.
- Headspace vapour concentrations ranged from non-detect (in TH12 and TH100) to 100% lower explosive limit of hexane (LEL) (in TH9).
- LPH was not detected in any monitoring wells.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from the eight (8) offsite monitoring wells (TH8, TH9, MW16-01, TH11, TH12, TH100, TH101 and TH102) on August 10-31, 2016. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), n-Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the samples collected from TH9, TH11, TH12, TH101, TH102, which exceeded for concentrations of one or more of PHC F1-F4.

The January 2017 Onsite groundwater monitoring report provides the following information:

- Nine (9) onsite monitoring wells (TH1 through TH7, MW15-01 and MW15-02) were monitored on August 9, 2016 for depth to groundwater, petroleum vapour concentrations and presence or absence of LPH.
- The depth to groundwater measured in the monitoring wells ranged from 2.50 mbgs (in MW15-01) to 4.17 mbgs (in TH7). The groundwater flow direction was not interpreted to be south.
- Headspace vapour concentrations ranged from non-detect (in various wells) to 85 ppm in TH3.
- LPH was not detected in any monitoring wells.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from the nine onsite monitoring wells (TH1 through TH7, MW15-01 and MW15-02) on August 9-10, 2016. The groundwater samples were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, n-Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the samples collected from TH4, TH5 and MW15-02, which exceeded for concentrations of one or more of PHC F1-F4.

Our review of the above reports indicates that petroleum hydrocarbon (PHC) impacts were identified in groundwater both onsite (TH4, TH5 and MW15-02) and offsite (TH9, TH11, TH12, TH101, TH102). In addition, the PHC impacts identified at the locations of MW15-02 (onsite) and TH9, TH101 and TH102 (offsite) have not been delineated. We understand additional groundwater sampling program was carried out in 2017 and our comments will be provided in the letter that will follow.

Should you have any further questions, please do not hesitate to contact me directly.

Yours truly,

Farzana Islam

Groundwater Monitoring Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Mr. Koo,

Thank you for submitting the following reports:

- *"2017 Groundwater and Soil Vapour Probe Monitoring and Sampling Report, Former Imperial Retail Fuel Outlet, 1660 Merivale Road, Ottawa, Ontario"*, prepared by Golder Associates Ltd. (Golder), dated February 16, 2018.

The 2017 groundwater monitoring report provides the following information:

- Seventeen (17) monitoring wells (TH1 through TH9, TH11 to TH12, TH100 through TH102, MW15-01, MW15-02, MW16-01) were monitored on June 20, 2017 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH) on June20-21, 2017. Golder reports that the monitoring well TH10 was decommissioned on August 24, 2016, and was replaced with a newly installed monitoring well MW16-01.
- The depth to groundwater measured in the monitoring wells ranged from 2.31 metres below ground surface (mbgs) (in MW15-01) to 3.68 mbgs (in TH6). The inferred groundwater flow direction is to the south.
- The headspace vapour concentrations measured in the monitoring wells ranged from 677 parts per million by volume (ppmv) to 1,668 ppmv.
- LPH was not detected in any monitoring wells.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from fifteen (15) monitoring wells (TH1, TH2, TH3, TH4, TH5, TH6, TH7, TH9, TH12, TH100, TH101, TH102, MW15-01, MW15-02 and MW16-01) on June 20-22, 2017. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4) and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the groundwater samples collected from TH4, TH5, TH7, TH9, TH12, TH101, TH102 and MW16-01, which exceeded for concentrations of one or more of PHC F1-F3.
- Golder also reports that two soil vapour probes (SV16-01 and SV16-02) were installed on December 5, 2016. Soil vapour samples were submitted for the analysis of BTEX, PHC F1-F4 and volatile organic compounds (VOCs). The analytical results of the soil vapour samples were reported by Golder to have no have no exceedances.

Please note, the soil vapour intrusion assessment guidance document titled "*Draft Technical Guidance: Soil Vapour Intrusion Assessment, September 2013*" has not been finalized by the Ministry of the Environment (MOE). It also has not been made available to public for use and is not in effect to date. As such, TSSA cannot provide comments on the soil vapour monitoring and sampling results.

Our review of the 2017 groundwater monitoring/sampling report indicates that the petroleum hydrocarbon (PHC) impacts were identified in groundwater both onsite (TH4, TH5 and TH7) and offsite (TH9, TH12, TH101, TH102 and MW16-01). Our review also indicates that the identified PHC impacts in groundwater in the vicinity of TH9, MW16-01, TH102, TH10, TH5 and TH7 have not been completely delineated.

On February 27, 2018, an email correspondence between Imperial Oil and the TSSA indicates that the discussion regarding offsite delineation and contamination management plan (CMP) on the City of Ottawa's (the City) properties along the road allowances of the Merivale Road and the Viewmount Drive is still ongoing.

Based on the information provided to date, TSSA requires the following:

- The complete delineation of all identified petroleum hydrocarbon impacts, both on-site and where practical and applicable, off-site;
- The City must be provided with copies of reports in regard to the groundwater monitoring and sampling results for the offsite monitoring wells (TH8, TH9, TH100, MW16-01, TH102, TH101 and TH12) located on the City's properties. TSSA must be copied and/or provided with copies of all correspondences between the City and Imperial Oil;
- Following the complete delineation, TSSA requires the submission of a formal Contaminant Management Plan (CMP) if further remedial work is not carried out to remove the impacted soil and/or groundwater;
- Until complete delineation is achieved, please continue the groundwater monitoring and sampling program on seventeen (17) monitoring wells (TH1 through TH9, TH11, TH12, TH100 through TH102, MW15-01, MW15-02 and MW16-01) an annual basis (in spring or fall) with annual report submission to the TSSA.

Please submit an action plan to this office by April 16, 2018 addressing the above issues.

Should you have any further questions, please do not hesitate to contact me directly. For general enquiries, please contact a Customer Service Advisor at 1.877.682.TSSA (8772) or e-mail customerservices@tssa.org. When contacting TSSA regarding this file, please refer to the Service Request number provided above.

Yours truly,

Farzana Islam

Groundwater Monitoring Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Mr. Koo,

Thank you for submitting the following reports:

- *"2017 Groundwater and Soil Vapour Probe Monitoring and Sampling Report, Former Imperial Retail Fuel Outlet, 1660 Merivale Road, Ottawa, Ontario"*, prepared by Golder Associates Ltd. (Golder), dated February 16, 2018.

The 2017 groundwater monitoring report provides the following information:

- Seventeen (17) monitoring wells (TH1 through TH9, TH11 to TH12, TH100 through TH102, MW15-01, MW15-02, MW16-01) were monitored on June 20, 2017 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH) on June20-21, 2017. Golder reports that the monitoring well TH10 was decommissioned on August 24, 2016, and was replaced with a newly installed monitoring well MW16-01.
- The depth to groundwater measured in the monitoring wells ranged from 2.31 metres below ground surface (mbgs) (in MW15-01) to 3.68 mbgs (in TH6). The inferred groundwater flow direction is to the south.
- The headspace vapour concentrations measured in the monitoring wells ranged from 677 parts per million by volume (ppmv) to 1,668 ppmv.
- LPH was not detected in any monitoring wells.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from fifteen (15) monitoring wells (TH1, TH2, TH3, TH4, TH5, TH6, TH7, TH9, TH12, TH100, TH101, TH102, MW15-01, MW15-02 and MW16-01) on June 20-22, 2017. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4) and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the groundwater samples collected from TH4, TH5, TH7, TH9, TH12, TH101, TH102 and MW16-01, which exceeded for concentrations of one or more of PHC F1-F3.
- Golder also reports that two soil vapour probes (SV16-01 and SV16-02) were installed on December 5, 2016. Soil vapour samples were submitted for the analysis of BTEX, PHC F1-F4 and volatile organic compounds (VOCs). The analytical results of the soil vapour samples were reported by Golder to have no have no exceedances.

Please note, the soil vapour intrusion assessment guidance document titled "*Draft Technical Guidance: Soil Vapour Intrusion Assessment, September 2013*" has not been finalized by the Ministry of the Environment (MOE). It also has not been made available to public for use and is not in effect to date. As such, TSSA cannot provide comments on the soil vapour monitoring and sampling results.

Our review of the 2017 groundwater monitoring/sampling report indicates that the petroleum hydrocarbon (PHC) impacts were identified in groundwater both onsite (TH4, TH5 and TH7) and offsite (TH9, TH12, TH101, TH102 and MW16-01). Our review also indicates that the identified PHC impacts in groundwater in the vicinity of TH9, MW16-01, TH102, TH10, TH5 and TH7 have not been completely delineated.

On February 27, 2018, an email correspondence between Imperial Oil and the TSSA indicates that the discussion regarding offsite delineation and contamination management plan (CMP) on the City of Ottawa's (the City) properties along the road allowances of the Merivale Road and the Viewmount Drive is still ongoing.

Based on the information provided to date, TSSA requires the following:

- The complete delineation of all identified petroleum hydrocarbon impacts, both on-site and where practical and applicable, off-site;
- The City must be provided with copies of reports in regard to the groundwater monitoring and sampling results for the offsite monitoring wells (TH8, TH9, TH100, MW16-01, TH102, TH101 and TH12) located on the City's properties. TSSA must be copied and/or provided with copies of all correspondences between the City and Imperial Oil;
- Following the complete delineation, TSSA requires the submission of a formal Contaminant Management Plan (CMP) if further remedial work is not carried out to remove the impacted soil and/or groundwater;
- Until complete delineation is achieved, please continue the groundwater monitoring and sampling program on seventeen (17) monitoring wells (TH1 through TH9, TH11, TH12, TH100 through TH102, MW15-01, MW15-02 and MW16-01) an annual basis (in spring or fall) with annual report submission to the TSSA.

Please submit an action plan to this office by April 16, 2018 addressing the above issues.

Should you have any further questions, please do not hesitate to contact me directly. For general enquiries, please contact a Customer Service Advisor at 1.877.682.TSSA (8772) or e-mail customerservices@tssa.org. When contacting TSSA regarding this file, please refer to the Service Request number provided above.

Yours truly,

Farzana Islam

Groundwater Monitoring Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Mr. Koo,

Thank you for submitting the following reports:

- *"2015 Supplemental Subsurface, Groundwater Monitoring and Sampling Investigation, 1660 Merivale Road, Ottawa, Ontario"*, prepared by Golder Associates Ltd. (Golder), dated May 6, 2016;
- *"2016 Groundwater Monitoring and Sampling Report, Adjacent to 1660 Merivale Road, Ottawa, ON"*, prepared by Golder, dated November 21, 2016; and
- *"2016 Groundwater Monitoring and Sampling Report, Former Imperial Oil Retail Fuel Outlet, 1660 Merivale Road, Ottawa, ON"*, prepared by Golder, dated January 31, 2017.

The May 2016 subsurface investigation report provides the following information:

- Two (2) boreholes (MW15-01 and MW15-02) were advanced to depths 6.0 metres below ground surface (mbgs) and 4.9 mbgs, respectively on September 9, 2015. Both the boreholes were completed as monitoring wells MW15-01 and MW15-02.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Four (4) soil samples (recovered from the boreholes) were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, n-Hexane and lead. The analytical results of the submitted soil samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters
- The two (2) newly installed monitoring wells (MW15-01 and MW15-02) and seven (7) onsite monitoring wells (TH1 through TH7) were monitored on November 17, 2015 for depth to groundwater, petroleum vapour concentrations and presence or absence of LPH.
- The depth to groundwater measured in the monitoring wells ranged from 2.41 mbgs (in MW15-01) to 3.94 mbgs (TH6). The groundwater flow direction is to the south.
- Headspace vapour concentrations measured in the monitoring wells ranged from 5 ppm (in TH2) to 1250 ppm (in TH6). LPH was not detected in any monitoring wells.
- Groundwater samples were collected from the two (2) newly installed monitoring wells (MW15-01 and MW15-02) and seven (7) onsite monitoring wells (TH1 through TH7) on October 28, 2015 or on November 17, 2017. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). The groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), n-Hexane and lead.

- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the samples collected from TH4, TH5 and TH7 and MW15-02 which exceeded for PHC F1-F2.

The November 2016 Offsite groundwater monitoring report provides the following information:

- Eight (8) offsite monitoring wells (TH8, TH9, TH10, TH11, TH12, TH100, TH101 and TH102) were monitored on August 10, 2016 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH). Golder reports that the monitoring well TH10 was decommissioned on August 24, 2016, and was replaced with a newly installed monitoring well MW16-01.
- The depth to groundwater measured in the monitoring wells ranged from 2.88 metres below ground surface (mbgs) (in TH12) to 3.68 mbgs (in TH9). The groundwater flow direction was not interpreted.
- Headspace vapour concentrations ranged from non-detect (in TH12 and TH100) to 100% lower explosive limit of hexane (LEL) (in TH9).
- LPH was not detected in any monitoring wells.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from the eight (8) offsite monitoring wells (TH8, TH9, MW16-01, TH11, TH12, TH100, TH101 and TH102) on August 10-31, 2016. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), n-Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the samples collected from TH9, TH11, TH12, TH101, TH102, which exceeded for concentrations of one or more of PHC F1-F4.

The January 2017 Onsite groundwater monitoring report provides the following information:

- Nine (9) onsite monitoring wells (TH1 through TH7, MW15-01 and MW15-02) were monitored on August 9, 2016 for depth to groundwater, petroleum vapour concentrations and presence or absence of LPH.
- The depth to groundwater measured in the monitoring wells ranged from 2.50 mbgs (in MW15-01) to 4.17 mbgs (in TH7). The groundwater flow direction was not interpreted to be south.
- Headspace vapour concentrations ranged from non-detect (in various wells) to 85 ppm in TH3.
- LPH was not detected in any monitoring wells.
- Golder selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from the nine onsite monitoring wells (TH1 through TH7, MW15-01 and MW15-02) on August 9-10, 2016. The groundwater samples were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, n-Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exceptions of the samples collected from TH4, TH5 and MW15-02, which exceeded for concentrations of one or more of PHC F1-F4.

Our review of the above reports indicates that petroleum hydrocarbon (PHC) impacts were identified in groundwater both onsite (TH4, TH5 and MW15-02) and offsite (TH9, TH11, TH12, TH101, TH102). In addition, the PHC impacts identified at the locations of MW15-02 (onsite) and TH9, TH101 and TH102 (offsite) have not been delineated. We understand additional groundwater sampling program was carried out in 2017 and our comments will be provided in the letter that will follow.

Should you have any further questions, please do not hesitate to contact me directly.

Yours truly,

Farzana Islam

2017 GROUNDWATER AND SOIL VAPOUR PROBE MONITORING AND SAMPLING REPORT
FORMER IMPERIAL RETAIL FUEL OUTLET
1660 MERIVALE ROAD, OTTAWA, ONTARIO
(SAP NO. 88001627)

INTRODUCTION

Golder Associates Ltd. (Golder) was retained by Imperial Oil Limited (Imperial) to conduct a groundwater and soil vapour probe monitoring and sampling program at the former retail fuel outlet at 1660 Merivale Road, Ottawa, Ontario (the Site) (Figures 1 to 2). The fieldwork was conducted on December 5 and 13, 2016, June 20 to 22, July 21 and November 21, 2017. Limitation of liability, scope of report and third-party Reliance are provided in Appendix A.

SCOPE OF WORK

- Monitoring 17 existing on- and off-site groundwater monitoring wells for vapour concentrations, depth to groundwater and the thickness, if present, of Light Non-Aqueous Phase Liquid (LNAPL);
- Collecting groundwater samples from 17 monitoring wells using a low-flow sampling method for laboratory analysis of Benzene, Toluene, Ethylbenzene, Xylenes (BTEX), Petroleum Hydrocarbon (PHC) Fractions F1 to F4 and dissolved lead;
- Hydrovacing two boreholes to a maximum depth of 1.87 metres below ground surface (mbgs) and completing both as soil vapour (SV) probes (SV16-01 and SV16-02);
- Monitoring the two SV probes and collecting samples for laboratory analysis of BTEX, PHC Fractions F1 and F2 and Volatile Organic Compounds (VOCs).
- Comparing the groundwater and SV analytical results to the following guidelines:
  - Comparison of the groundwater analytical results for BTEX, PHC Fractions F1 to F4 and dissolved lead to the Ontario Ministry of the Environment and Climate Change's (MOECC's) Table 3 Full Depth Generic Site Condition Standards for groundwater in medium and fine textured soil in a non-potable groundwater condition under all types of property use (MOECC 2011);

Golder, Golder Associates and the GA globe design are trademarks of Golder Associates Corporation.

- Comparison of the soil vapour analytical results to the applicable soil vapour screening levels (SVSL) generated using the MOECC *Modified Generic Risk Assessment (Tier 2) Spreadsheet Model* (April 15, 2011) (MGRA) for BTEX, PHC Fractions F1 and F2 and VOCs.

GROUNDWATER METHODOLOGY

Combustible Gas Detector Calibrations and Headspace Concentrations

- Headspace vapour concentrations were measured using an RKI Eagle® Combustible Organic Vapour Monitor (OVM) with methane elimination. The OVM was bump tested daily to 15% lower explosive limit (LEL) using a hexane standard. If the bump test differed more than 10% from the stated concentration of the standard, the OVM was adjusted to match the stated concentration of the calibration gas. Calibrations were logged at the start of each day.

- Vapour concentrations were taken from inside each well casing by placing the OVM nozzle about 15 to 30 cm below the Top Of Casing (TOC). The OVM reading was taken immediately after the cap had been removed from the top of the monitoring well casing, in order to reduce the potential loss of volatiles from within the casing. The peak OVM reading was recorded.

Depth to Groundwater and LNAPL Thickness

- Depth to groundwater and, if present, the thickness of LNAPL were measured using a Heron oil/water interface probe. If LNAPL was detected, then its presence was visually confirmed using a bailer. Prior to use in each well, the interface probe was cleaned using a phosphate-free detergent and water solution and rinsed with distilled water to reduce the potential for cross-contamination. Depth to groundwater measurements were taken from the TOC.

Low-Flow Sampling

- Groundwater samples were collected using a low-flow sampling method. Water was pumped from each well, at a rate of 0.1 to 1 L/min, using Waterra® High Density Polyethylene (HDPE) tubing connected to a peristaltic pump with a portion of silicone rubber tubing. Water quality indicator parameters including Electrical Conductivity (EC), pH and temperature were measured during pumping using a YSI 556® Multiprobe System (YSI) and flow through cell. Calibration of the YSI was completed per the manufacturer's instructions. Purged water was retained on-site in a 205-L barrel for future off-site disposal.

- Nineteen samples, including two duplicates, a field blank, a trip blank and fifteen groundwater samples, were collected.

Laboratory Analysis of Groundwater Samples

- The samples were submitted under chain-of-custody to Maxxam Analytics Inc. (Maxxam) in Mississauga, Ontario for analysis of BTEX, PHC Fractions F1 to F4 and dissolved lead.

- Groundwater samples for BTEX and PHC Fraction F1 analysis were placed in 44-millilitre (mL) clear glass vials provided by the laboratory and preserved with sodium bisulphate as a microbial inhibitor. The groundwater samples for PHC Fractions F2 to F4 analysis were placed in 250-mL amber glass bottles and preserved with sodium bisulphate.

- The groundwater samples for dissolved lead analysis were placed in 120-mL High-Density Polyethylene (HDPE) bottles, field-filtered and preserved with nitric acid.
- Sampling containers were preserved in coolers with ice and transported to Maxxam for chemical analysis.

Waste Purge Water Removal

Badger Daylighting of Ottawa, Ontario, a MOECC licensed waste hauler, was used to recover 100 litres (L) of waste purged groundwater from the Site on July 4, 2017. The liquid was disposed of at Tomlinson Environmental Services in Ottawa, Ontario, an MOECC-approved waste receiver.

Quality Assurance and Quality Control

A Quality Assurance and Quality Control (QA/QC) program was followed to reduce the potential for, and to quantify, effects on the sample results that may have been influenced by sample collection, handling, shipping and analysis. As part of the QA/QC program, sampling protocols included reducing sample handling to the extent practicable, submitting field QA/QC samples, using dedicated sampling equipment, using sample-specific identification and labelling procedures, and using chain-of-custody records.

SOIL VAPOUR METHODOLOGY

Soil Vapour: Soil Vapour Probe Installation

Two soil vapour probes (SV16-01 and SV16-02) were installed in daylighted boreholes on December 5, 2016. Each soil vapour probe was constructed of 15-millimetre (mm) diameter, 0.10-metre (m) long metal screen that was connected to high-density polyethylene (HDPE) with polyester yarn-reinforced sample tubing. Soil vapour probes were connected to 6.35 mm diameter Teflon tubing which was sealed above grade with a ball valve to prevent soil vapour leakage and ambient air intrusion. The annulus surrounding the screened section of each soil vapour probe was backfilled with clean sand up to approximately 0.10 m above the top of the screened section of the soil vapour probes. A 0.3 m layer of dry powdered bentonite (Benseal) was placed on top of the sand, followed by a powdered Benseal slurry seal placed in the borehole in 0.3 m lifts until a depth of approximately 0.3 mbgs was reached, to accommodate the installation of a flush-mounted road box. Hydrated bentonite was tamped flat during the installation of the lifts to create an airtight seal, and placed around the tubing to just below grade. A protective valve box was installed at ground surface. The location of the newly installed soil vapour probes (SV16-01 and SV16-02) are shown on Figure 2. Schematic logs for the soil vapour probes are provided in Appendix B.

Soil Vapour: Sampling

Weather Conditions during Sampling

Weather conditions[1] on July 17, 2017 were overcast. The outdoor air temperature was 22 degrees Celsius (°C). The relative humidity was 73 percent (%). The barometric pressure was measured at 100.9 kilopascals (kPa) (Environment Canada 2017[2]).

Weather conditions on November 21, 2017 were clear. The outdoor air temperature was -4°C. The relative humidity was 93%. The barometric pressure was measured at 100.7 kPa (Environment Canada 2017[2]).

[1] Weather information was taken from the meteorological station, Ottawa, Ontario *(2017 Hourly Data Report)* located closest to the Site.

[2] Environment Canada, 2017, https://weather.gc.ca/

Probe Leak Testing

The soil vapour probe sample locations (SV16-01 and SV16-02) were leak tested on December 13, 2016, July 17 and November 21, 2017, to assess whether ambient air was penetrating the ground surface (e.g., along the outside of the tubing) and mixing with soil vapours during sampling.

To conduct leak testing, a plastic shroud was placed over the probe and the HDPE tubing leading from the probe exited through a sealed hole in the top of the shroud. The shroud was then filled with helium from a cylinder. The helium concentration inside the shroud was measured using a helium detector. Once helium concentrations inside the shroud reached at least 18 percent helium by volume, the helium flow was turned off. The helium detector was then connected to the HDPE tubing from the soil vapour probe. The helium detector sampling flow rate was 0.5 litres per minute (L/min) as confirmed through the use of a digital flow reader. The helium detector was used to sample the soil vapour probe for one minute and the maximum helium concentrations were recorded.

Soil Vapour Sampling

Prior to sample collection, at least three probe volumes of soil gas were purged from the probes. An organic vapour detection system was used to measure organic vapour concentrations in the soil vapour collected in the Tedlar bags.

Following purging and leak testing, soil vapour samples from the two soil vapour probes (SV16-01 and SV16-02) were collected following procedures outlined in the United States Environmental Protection Agency (USEPA) Method TO-15. A flow regulator supplied by Maxxam, was used to regulate the volumetric soil vapour flow into the Summa canister at a rate of 70 millilitres per minute (mL/min) during a 20-minute sampling period. A 1.4 litre (L) Summa canister, batch certified by Maxxam to be free of contaminants, was fitted with a vacuum gauge for sample collection. Prior to use, the initial Summa canister pressure was confirmed to be less than or equal to -27 inches of mercury when gauged.

The soil vapour samples were collected and submitted to the Mississauga facility of Maxxam, a Standards Council of Canada (SCC) accredited laboratory, for analysis of BTEX, PHC Fractions F1 and F2, and VOCs. During the December 2016, and July and November 2017 sampling events, 11 samples, including three field duplicates, two field blanks and six soil vapour probe samples were submitted to Maxxam for analysis.

Quality Assurance and Quality Control

A Quality Assurance and Quality Control (QA/QC) program was followed to reduce the potential for, and to quantify, impacts introduced during sample collection, handling, shipping and analysis. As part of the QA/QC program, sampling protocols included reducing sample handling to the extent practical, submitting field QA/QC samples, using dedicated sampling equipment, using sample-specific identification and labelling procedures, and using chain-of-custody records.

RESULTS

Monitoring Well Headspace Vapour (Date; Range)

- June 20 and 21, 2017; Not detected to 100% LEL (Table 1).

LNAPL Occurrence (Date; Observations)

- June 20 and 21, 2017; Not detected in any of the accessible monitoring wells (Table 1).

Groundwater Monitoring (Date; Stratigraphic Unit and Depth to Groundwater Range; Groundwater Direction)

- June 20 and 21, 2017; Depth to groundwater levels ranged from 2.31 to 3.68 mbgs (Table 1); South (Figure 3).

Groundwater Analytical Results (Date; Parameters; No. of wells)

- June 21 to 22, 2017; BTEX and PHC parameters; Exceedances identified in 8 locations (Figure 4 and Table 2).

Probe Leak Test Results (Date; Well; Result expressed as % helium)

- December 13, 2016; SV16-01 and SV16-02; 0 to 0.44% (Table 3).
- July 21, 2017; SV16-01 and SV16-02; 0% (Table 3).
- November 21, 2017; SV16-01 and SV16-02; 0% (Table 3).

Field Organic Vapour Results

- December 13, 2016; Organic vapour concentrations, 197 parts per billion by volume (ppbv) to 240 ppbv (Table 3).
- July 21, 2017; Organic vapour concentrations, 677 parts per million by volume (ppmv) to 1,668 ppmv (Table 3).
- November 21, 2017; Organic vapour concentrations, 13.73 ppmv to 24.92 ppmv (Table 3).

Soil Vapour Analytical Results (Date; Parameters; No. of wells)

- December 13, 2016; BTEX, PHC and VOC parameters; No exceedances (Figure 5 and Table 4)
- July 21, 2017; 1 BTEX, PHC and VOC parameters; No exceedances (Figure 5 and Table 4)
- November 21, 2017; BTEX, PHC and VOC parameters; No exceedances (Figure 5 and Table 4)

QUALITY ASSURANCE/QUALITY CONTROL

- Copies of the associated laboratory certificates of analysis are provided in Appendix C.
- Two data quality issues were identified but did not have a material effect on the reliability of the data in this report. The data are considered reliable (Appendix D).

Notes:

[a] TH1 to TH5 and TH7 elevations are relative to local benchmark (centre of storm sewer catch basin located approximately 5 metres west of kiosk).

[b] MW15-01 , MW15-02 and TH6 elevations are relative to local benchmark (ground surface at TH7).

[c] Well was not monitored due to bentonite in the casing prohibiting interface probe to descend

D - well was destroyed

LEL - Lower explosive limit

masl - metres above sea level

mbgs - metres below ground surface

mbtoc - metres below top of casing

mm - millimetres

n/a - not available

n/d - not detected

n/m - not measured

ppmv - parts per million by volume

APPENDIX A LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by Golder Associates Ltd. for Imperial Oil Limited. It is intended for the sole and exclusive use of Imperial Oil Limited, its affiliated companies and partners and their respective insurers, agents, employees and advisors (collectively, Imperial Oil). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and Golder Associates Ltd. make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by Golder Associates Ltd. with respect to this report and any conclusions or recommendations made in this report reflect Golder Associates Ltd.'s judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of Golder Associates Ltd. Nothing in this report is intended to constitute or provide a legal opinion.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods. Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Air sampling canisters have been cleaned in accordance with U.S. EPA Method TO14A. At the end of the cleaning, evacuation, and pressurization cycles, one canister was selected and was pressurized with Zero Air. This canister was then analyzed via TO14A on a GC/MS. The canister must have been found to contain <0.2 ppbv concentration of all target analytes in order for the batch to have been considered clean. Each canister also underwent a leak check prior to shipment.

Please Note: SUMMA® canister samples will be retained by Maxxam for a period of 5 calendar days or as contractually agreed from the date of this report, after which time they will be cleaned for reuse. If you require a longer sample storage period, please contact your service representative.

GENERAL COMMENTS

Increased DL for propene due to interference from propane.

Sample DPX367 [SV16-01] : 2-Butanone biased high due to co-elution with hexane. This result represents the highest concentration possible of 2-butanone.

Sample DPX368 [SV16-02] : 2-Butanone biased high due to co-elution with hexane. This result represents the highest concentration possible of 2-butanone.

Sample DPX369 [DUP A] : 2-Butanone biased high due to co-elution with hexane. This result represents the highest concentration possible of 2-butanone.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6R1882

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within acceptance
Extraction Surrogate Recovery			X	criteria, please see QA/QC appendix.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within
Trip Blank Concentration			X	alert limits.
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	n/a

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B7D2158
Received: 2017/06/23, 10:00

Sample Matrix: Water
Samples Received: 3

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	3	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	3	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	3	CAM SOP-00447	EPA 6020B m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: June 21, 2017

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7D2158

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within
Trip Blank Concentration			X	alert limits.
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	0.0°C

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: June 22, 2017

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7D2163

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were collected.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.7°C

Results relate only to the items tested.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: June 20, 2017

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7D2167

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within
Trip Blank Concentration			X	alert limits.
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Petroleum Hydro. CCME F1 & BTEX in Water	4	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	4	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	4	CAM SOP-00447	EPA 6020B m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.7°C

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	UNITS	QC Limits
			F4 (C34-C50 Hydrocarbons)	2017/06/28		93	%	60 - 130

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: June 20 and 21, 2017

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7D2173

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were collected.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Sample Matrix: Water
Samples Received: 4

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	4	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	4	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	4	CAM SOP-00447	EPA 6020B m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: June 21 and 22, 2017

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7D2178

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were collected.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Received: 2017/06/23, 10:00

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	2	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	2	CAM SOP-00316	CCME PHC-CWS m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date:

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7D2188

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration	X			All field QC samples are within
Trip Blank Concentration	X			alert limits.
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) Air sampling canisters have been cleaned in accordance with U.S. EPA Method TO14A. At the end of the cleaning, evacuation, and pressurization cycles, one canister was selected and was pressurized with Zero Air. This canister was then analyzed via TO14A on a GC/MS. The canister must have been found to contain <0.2 ppbv concentration of all target analytes in order for the batch to have been considered clean. Each canister also underwent a leak check prior to shipment.

Please Note: SUMMA® canister samples will be retained by Maxxam for a period of 5 calendar days or as contractually agreed from the date of this report, after which time they will be cleaned for reuse. If you require a longer sample storage period, please contact your service representative.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) 2-Butanone biased high due to co-elution with hexane. This result represents the highest concentration possible of 2-butanone.

(2) Increased DL due to interference from propane.

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7F6793

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within
Trip Blank Concentration			X	alert limits.
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Air sampling canisters have been cleaned in accordance with U.S. EPA Method TO14A. At the end of the cleaning, evacuation, and pressurization cycles, one canister was selected and was pressurized with Zero Air. This canister was then analyzed via TO14A on a GC/MS. The canister must have been found to contain <0.2 ppbv concentration of all target analytes in order for the batch to have been considered clean. Each canister also underwent a leak check prior to shipment.

Please Note: SUMMA® canister samples will be retained by Maxxam for a period of 5 calendar days or as contractually agreed from the date of this report, after which time they will be cleaned for reuse. If you require a longer sample storage period, please contact your service representative.

GENERAL COMMENTS

Sample FPK132 [AIR] : Increased DL for propene due to interference from propane.

Results relate only to the items tested.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Sampling Date: November 21, 2017

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1669090-1155

Sample Submission Number: B7Q3206

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery			X	acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	Samples SV16-02 and DUP 1 exceed the alert limit
Trip Blank Concentration			X	for tetrachloroethylene (66%). All remaining field
Field Duplicate RPD		X		QC samples are within alert limits.

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

APPENDIX D QUALITY ASSURANCE/QUALITY CONTROL

QUALITY ASSURANCE/QUALITY CONTROL

In conjunction with the field investigations completed to date, a Quality Assurance/Quality Control (QA/QC) program was implemented to ensure the integrity of the groundwater and soil vapour sampling and analytical testing results.

1.0 FIELD PROGRAM

All sampling activities were completed in accordance with Golder's Technical Field Procedures by trained Golder personnel. All field activities were documented in field notes and results were recorded on standard field forms. All field equipment involved in sampling and monitoring was decontaminated in accordance with Golder's Technical Procedures. Groundwater and soil vapour samples were collected using appropriate handling protocols and were placed in sample containers provided by Maxxam Analytics Inc. (Maxxam).

All re-useable field equipment involved in collecting samples was decontaminated between each sampling location. To help prevent cross-contamination, a new pair of clean nitrile gloves was used for the collection of each sample.

Samples were given unique identification numbers and the sampling containers were preserved in ice-filled coolers. Samples were logged onto formal chain-of-custody documents and transported to Maxxam's Mississauga Laboratory for chemical analysis. Maxxam's Mississauga laboratory is accredited by the Standards Council of Canada (SCC).

Blind field duplicate samples were submitted for analysis. Trip and field blanks were submitted for analysis, as necessary, to evaluate the potential for cross-contamination during the sampling and transportation of the samples. Submission of blind field duplicate QC samples was at a minimum rate of 10% of total samples.

2.0 LABORATORY PROGRAM

The laboratory QA/QC program included adherence to laboratory sampling and analysis protocols (e.g., hold times, sample containers, preservatives, detection limits and approved methodology) and the analysis of laboratory method blanks, laboratory sample duplicates, surrogate recovery and chemical spikes.

The laboratory method blank analysis results were used to detect interferences or impurities introduced by the laboratory equipment, reagents, or solvents. Surrogate recovery is analyzed for organics by spiking samples with known quantities of surrogate chemicals which have similar chemical properties to the parameters being analyzed. The reported recovery provides an indication of the analytical method accuracy for that sample. Matrix spikes were conducted by adding known concentrations of the analyte of interest to a sample to evaluate the effects of the sample matrix on the analytical method. The analysis of selected samples in duplicate is used to evaluate the reproducibility of the analytical method.

4.0 DATA RECEPTION

Once laboratory analytical results were received, Golder completed a review of field and laboratory quality. This included review of laboratory QC performance to confirm results are within acceptance criteria, as well as evaluation of field duplicate and blank results to confirm they were within alert limits. Upon receipt of the analytical results, Relative Percent Difference (RPD) values between the original samples and their blind field duplicates were calculated as follows:

$$RPD = \frac{|x_2 - x_1|}{\left(\frac{x_1 + x_2}{2}\right)} \times 100$$

Where: RPD = relative percent difference
X_2 = sample value
X_1 = blind field duplicate or replicate value.

Since analytical error increases near the Reportable Detection Limit (RDL), an RPD was only calculated where the concentrations of both the original and blind field duplicate samples were greater than five times the RDL. The calculated RPDs were then compared to parameter specific alert limits.

Exceedances of the QC acceptance or alert criteria were investigated with the laboratory and, if warranted, a corrective action report was requested from the laboratory.

5.0 DATA QUALITY REVIEW RESULTS

Results of the data quality review are summarized in Table D1. The RPD calculations and QC results are presented in Table D2 and D5.

Two field duplicate groundwater samples were collected and submitted to the laboratory as part of the groundwater investigation. One field blank and one trip blank were also submitted to the laboratory as part of the groundwater QC program. One soil vapour field duplicate samples and two ambient air field blank samples were collected and submitted to the laboratory as part of the soil vapour probe investigation.

Based on the data quality review, two data quality issues were identified. The issues did not have a material effect on the reliability of the data presented in this report. The issues are discussed in detail in Table D1.

6.0 SUMMARY OF RESULTS

Based on the review of the QA/QC results, the data presented in this report are considered to be reliable.

Table D1
Summary of Quality Control Samples
1660 Merivale Road, Ottawa, Ontario
Imperial Oil Limited

Maxxam Job Number	Data Quality Waiver Issued (Yes/No)	Data Quality Waiver Number	Matrix	Maxxam Sample ID Affected	Test Affected	Data Quality Issue	Comments
B7D2158	No	n/a	Groundwater	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B7D2163	No	n/a	Groundwater	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B7D2167	No	n/a	Groundwater	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B7D2173	No	n/a	Groundwater	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B7D2178	No	n/a	Groundwater	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B7D2188	No	n/a	Water	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B6R1882	No	n/a	Air	LCS	1,4-Dioxane	Lab control sample recovery outside acceptance range of 70-130% for 1,4-Dioxane for batch 4795923.	For multi-parameter tests, 10% of parameters can fall outside of the acceptance range. Under these circumstances, the 1,4-Dioxane data reported can be considered reliable.
B7F6793	No	n/a	Air	n/a	n/a	No data quality issues were identified.	The data are considered reliable.
B7Q3206	No	n/a	Soil Vapour	FPK130 and FPK131	Tetrachloroethylene	Field duplicate samples SV16-02 and DUP 1 exceed the alert limit for tetrachloroethylene (66%).	A quality check of the data yielded similar results. Sample non-homogeneity is believed to be the root cause. Tetrachloroethylene concentrations in both the sample and the field duplicate were above the regulatory guideline, indicating that there will not be a material effect on the interpretation of the results of this parameter. Under these circumstances, the tetrachloroethylene data reported can be considered reliable.

F2, C10-C16 (as Decane)	µg/m^3	>50%	5	281	292	4

Notes:

Bold/Underlined - value exceeds alert limit

BTEX - benzene, toluene, ethylbenzene, xylenes

F1, F2 - petroleum hydrocarbon fractions 1 and 2

n/c - not calculated

RDL - reportable detection limit

RPD - relative percent difference

µg/m^3 - micrograms per cubic metre

> - greater than

< - less than

RPD is not calculated if either the original or field duplicate sample has a result of less than 5X the RDL

F2, C10-C16 (as Decane)	µg/m³	>5X RDL	5	563.0	**yes**	5	6,090.0	**yes**

Notes:
Bold/Underlined - value exceeds alert limit
BTEX - benzene, toluene, ethylbenzene, xylenes
F1, F2 - petroleum hydrocarbon fractions 1 and 2
NA - not analyzed
n/c - not calculated
RDL - reportable detection limit
RPD - relative percent difference
µg/m³ - micrograms per cubic metre
> - greater than
< - less than
RPD is not calculated if either the original or field duplicate sample has a result of less than 5X the RDL

Groundwater Monitoring Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Mr. Koo,

Thank you for submitting the following reports:

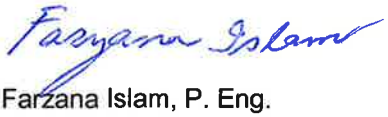
- *"Supplemental Phase II Environmental Assessment – 1660 Merivale Road, Ottawa, Ontario"*, prepared by EXP, dated November 20, 2014;
- *"2014 Groundwater Monitoring and Sampling Program Report, Site Address: 1660 Merivale Road, Ottawa, Ontario"*, prepared by exp Energy Services Ltd. (EXP), dated October 8, 2014;
- "*Interim Contaminant Management Plan, 1660 Merivale Road, Ottawa, Ontario"*, prepared by EXP, dated April 2, 2015; and

The November 2014 Supplemental Phase II ESA report provides the following information:

- Three (3) boreholes (TH100 to TH102) were advanced to a maximum depth of approximately 5.0 mbgs from September 16 to 19, 2014. The boreholes were advanced along the road allowance of Merivale Road (TH102 and TH101) and along the road allowance of Viewmount Drive (TH100). The boreholes were advanced in the bedrock.
- EXP selected the MOE Table 3 SCS for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
- Three (3) soil samples (one collected from each borehole) were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, methyl-t-butyl-ether (MTBE), hexane and lead. The analytical results of the submitted soil samples were reported by EXP to be below the selected MOE Table 3 SCS for all analyzed parameters
- The three (3) newly installed monitoring wells (TH100 to TH102) and five previously installed monitoring wells ((TH8, TH9, TH10, TH11 and TH12) were monitored on October 6, 2013 for depth to groundwater, petroleum vapour concentrations and presence or absence of LPH.
- The depth to groundwater ranged from 2.75 mbgs (TH12) to 3.60 mbgs (TH100). The groundwater flow direction was interpreted to be towards southwest.
- Headspace vapour concentrations ranged from 200 ppm (in TH100) to 100% LEL (in TH9). LPH was not detected in any monitoring wells.
- Groundwater samples were collected from the four (4) offsite monitoring wells (TH9, TH100, TH101 and TH102) on October 6, 2014. The groundwater samples were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, MTBE, Hexane and lead. The analytical results of the submitted groundwater samples were reported by EXP to be above the selected MOE Table 3 SCS for concentrations of one or more of PHC F1-F3 with the exception of the sample collected from TH100, which satisfied the selected MOE Table 3 SCS.

The October 2014 groundwater monitoring report provides the following information:

- Seven (7) onsite monitoring wells (TH1 through TH7) were monitored on August 26, 2014 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH).
- EXP selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
- The depth to groundwater ranged from 3.03 mbgs (in TH4) to 4.05 mbgs (in TH7). The groundwater flow direction was interpreted to be southeasterly.
- Headspace vapour concentrations ranged from non-detect (at various locations) to 30% lower explosive limit of hexane (LEL) (in TH4).
- LPH was not detected in any monitoring wells.
- Groundwater samples were collected from the seven (7) onsite monitoring wells (TH1 through TH7) on August 26-27, 2014. The groundwater samples were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Groundwater samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by EXP to be below the selected MOE Table 3 SCS for all analyzed parameters with the exception of the samples collected from TH3, TH4, TH5 and TH7, which exceeded for concentrations of one or more of benzene, and/or PHC F1-F2.



The April 2015 Contaminant Management Plan (CMP) proposes the following:

- On an annual basis, the onsite monitoring wells (TH1 to TH7) and the offsite monitoring wells (TH8 to TH12 and TH100 to TH102) will be monitored for depth to groundwater, subsurface vapour concentrations and presence or absence of LPH.
- On an annual basis, the onsite monitoring wells (TH1 to TH7) and the offsite monitoring wells (TH8 to TH12 and TH100 to TH102) will be sampled for BTEX and PHC F1-F4.
- On an annual basis, a report summarizing the findings from the onsite monitoring wells will be submitted to the TSSA.
- On an annual basis, a report summarizing the findings from the offsite monitoring wells will be submitted to the TSSA and the City of Ottawa (the City). TSSA will be copied on all correspondence with the municipality.
- Up to three additional test holes are to be installed to further delineate the offsite ground water impacts to the north and east of the subject property. The completion of this work will depend on the access permission from the third party.
- Up to two additional test holes are to be installed to further delineate the ground water impacts to the south of TH7. The completion of this work has been planned for 2015.

Our review of the information provided in the 2014 reports indicates that the petroleum hydrocarbon (PHC) impacts identified in groundwater at the locations of onsite monitoring well TH7 and at the locations of offsite monitoring wells TH9, TH101 and TH102 have not been completely delineated. We understand that further groundwater impact delineation work was planned to be completed in 2015. The delineation work on the City of Ottawa's right-of-way is pending the access permission and the City's concurrence to the offsite CMP proposal. We understand that additional investigation and further groundwater monitoring program was carried out at the site in 2015, 2016 and in 2017. Our comments will be provided under a separate letter that will follow.

Should you have any further questions, please do not hesitate to contact me directly.

Yours truly,

Tank Replacement Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Mr. Scott,

Thank you for submitting the following reports:

- "*Phase II Environmental Assessment – 1660 Merivale Road, Ottawa, Ontario*", prepared by exp Energy Services Ltd. (EXP), dated December 5, 2013;
- "*2013 Ground Water Monitoring and Sampling Program Report, 1660 Merivale Road, Ottawa, Ontario*", prepared by EXP, dated July 22, 2013.

The December 2013 Phase II ESA report provides the following information:

- Five (5) boreholes (TH8 to TH12) were advanced to a maximum depth of approximately 5.0 metres below ground surface (mbgs) between August 28 and 33, 2012. Two boreholes (TH8 and TH9) were advanced along the road allowance of Merivale Road and three boreholes were advanced along the road allowance of Viewmount Drive. All boreholes were completed as monitoring wells.
- The boreholes were advanced in the bedrock. The boreholes were daylighted to a maximum depth of approximately 2.1 mbgs using a hydrovacuum truck.
- Six (6) soil samples (one collected from each borehole) were submitted to Maxxam Analytics Inc. (Maxxam), an accredited laboratory by the Canadian Association for Laboratory Accreditation Inc. (CALA). Soil samples were submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon fractions F1 to F4 (PHC F1-F4), polycyclic aromatic hydrocarbons (PAHs) and lead.
- EXP selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
- The analytical results of the submitted soil samples were reported by EXP to be below the selected MOE Table 3 SCS for all analyzed parameters.
- One coring water sample (W1) was also submitted to Maxxam for laboratory analysis of BTEX, hexane and PHC F1-F4. The analytical results of the submitted water sample were reported by EXP to be below the selected MOE Table 3 SCS for all analyzed parameters.
- The newly installed monitoring wells were monitored on June 10, 2013 for depth to groundwater, petroleum vapour concentrations and presence or absence of liquid petroleum hydrocarbon (LPH).
- The depth to groundwater ranged from 2.75 mbgs (TH12) to 3.03 mbgs (TH10). The groundwater flow direction was interpreted to be southerly.
- Headspace vapour concentrations ranged from 50 parts per million (ppm) to 18% lower explosive limit of hexane (LEL). LPH was not detected in any monitoring wells.
- Groundwater samples were collected from the four (4) offsite monitoring wells (TH8, TH10, TH11 and TH12) on June 10-11, 2013. The groundwater samples were submitted to Maxxam for

laboratory analysis of BTEX and PHC F1-F4. The analytical results of the submitted groundwater samples were reported by EXP to be above the selected MOE Table 3 SCS for concentrations of PHC F1-F2 with the exception of the sample collected from TH8, which satisfied the selected MOE Table 3 SCS.

The July 2013 Onsite groundwater monitoring report provides the following information:

- Seven (7) onsite monitoring wells (TH1 through TH7) were monitored on June 12, 2013 for depth to groundwater, petroleum vapour concentrations and presence or absence of LPH.
- The depth to groundwater measured in the monitoring wells ranged from 3.49 mbgs (in TH1) to 3.06 mbgs (in TH3). The groundwater flow direction was not interpreted to be south.
- Headspace vapour concentrations ranged from non-detect to 290 ppm in TH5.
- LPH was not detected in any monitoring wells.
- EXP selected the Ontario Ministry of the Environment (MOE) Table 3 full depth generic Site Condition Standards (SCS) for all types of property use in a non-potable groundwater condition, and medium to fine textured soils as being applicable for use at this site.
- Groundwater samples were collected from the seven onsite monitoring wells (TH1 through TH7) on June 13, 2013. The groundwater samples were submitted to Maxxam for laboratory analysis of BTEX, PHC F1-F4, Hexane and lead.
- The analytical results of the submitted groundwater samples were reported by Golder to be below the selected MOE Table 3 SCS for all analyzed parameters with the exception of the samples collected from TH3, TH4, TH5 and TH7, which exceeded for concentrations of one or more of benzene, xylenes, PHC F1-F4.

Our review of the above information indicates that the petroleum hydrocarbon (PHC) impacts identified in groundwater at the locations of onsite monitoring well TH7 and at the locations of offsite monitoring wells TH10, TH11 and TH12 have not been delineated. We understand that additional investigation and further groundwater monitoring program was carried out at the site in 2014, 2015, 2016 and 2017. Our comments will be provided under a separate letter that will follow.

Should you have any further questions, please do not hesitate to contact me directly.

ADJACENT TO 1660 MERIVALE ROAD, OTTAWA, ON

CONTAMINANT MANAGEMENT PLAN

Mr. Richard Barker

Introduction

Golder Associates Ltd. (Golder) was retained by Imperial Oil Limited (Imperial) to prepare a Contaminant Management Plan (CMP) for the property located at 1660 Merivale Road, Ottawa, Ontario. For the purpose of this letter, the Site is considered the lands adjacent to the property located at 1660 Merivale Road, owned by the City of Ottawa and forms part of the municipal rights of way (ROW) along Merivale Road (the Site). This letter documents the scope of the CMP as it pertains to the municipal ROW. A Site location and layout plan is provided as Figures 1 – 3.

The CMP is proposed in accordance with the Technical Standards and Safety Authority (TSSA) document: *Environmental Management Protocol for Fuel Handling Sites in Ontario* (EMP), August 2012.

Limitation of Liability, Scope of Report, and Third Party Reliance is included in this report.

Background

Golder and others have carried out a series of Environmental Site Assessment (ESA) and monitoring investigations at 1660 Merivale Road and the adjacent ROW. The following reports that have been prepared by Golder or others are pertinent, documenting site assessment activities at the Site:

- Phase II Environmental Site Assessment Adjacent to 1660 Merivale Road, Ottawa, ON. Report prepared by exp Energy Services Ltd., dated December 5, 2013.
- Supplemental Phase II Environmental Site Assessment Adjacent to 1660 Merivale Road, Ottawa, ON. Report prepared by exp Energy Services Ltd., November 20, 2014.
- Screening Level Risk Assessment, Right-of-way Adjacent to 1660 Merivale Road, Ottawa, ON (SAP No. 88001627). Report prepared by Golder, dated May 3, 2016
- 2015 Groundwater Monitoring and Sampling Report, Adjacent to 1660 Merivale Road, Ottawa, ON (SAP No. 88001627), Report prepared by Golder, dated May 6, 2016.

Golder Associates Ltd.

- 2016 Groundwater Monitoring and Sampling Report, Adjacent to 1660 Merivale Road, Ottawa, ON (SAP No. 88001627). Report prepared by Golder, dated November 21, 2016.

Based on the results of the environmental assessments (ESAs) completed at the Site by exp Energy Services Ltd. (exp) and Golder, exceedances of petroleum hydrocarbon (PHC) fractions F1 to F4 in groundwater were identified within the RoW. These soil and groundwater analytical results were compared against the MOECC Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition, Commercial/ Industrial/Community Property Use, coarse-textured soil, April 15, 2011 for soil and all types of property use for groundwater (Table 3 Standards).

Phase II ESA Adjacent to 1660 Merivale, exp, 2013

A Phase II ESA was carried out by exp and included installation of five monitoring wells (TH8 to TH12) including soil and groundwater sampling. No soil concentrations for petroleum hydrocarbons (PHC) fractions F1 to F4, select polycyclic aromatic hydrocarbons (PAHs), hexane and lead exceeded the Table 3 Standards. Groundwater samples from three monitoring wells (TH10, TH11 and TH12) were analysed for PHC F1 to F4, hexane and lead. Groundwater concentrations exceeded the Table 3 Standards for PHC fractions F1 and F2. A groundwater sample was not collected from TH9. The remaining groundwater samples reported concentrations below the Table 3 Standards.

Supplemental Phase II ESA Adjacent to 1660 Merivale, exp, 2014

A supplemental Phase II ESA was carried out by exp and included installation of three monitoring wells (TH100 to TH102) including soil and groundwater sampling. No soil concentrations for PHC fractions F1 to F4, hexane, methyl tert-butyl ether (MTBE) and lead exceeded the Table 3 Standards. Groundwater samples from four monitoring wells (TH9, TH100, TH101 and TH102) were analysed for PHC F1 to F4, hexane, MTBE and lead. Groundwater concentrations exceeded the Table 3 Standards for one or more of PHC fractions F1 to F3 at TH9, TH101 and TH102. The remaining groundwater samples reported concentrations below the Table 3 Standards.

Screening Level Risk Assessment, Right-of-way Adjacent to 1660 Merivale Road, Golder, 2016

A screening level risk assessment (SLRA) was conducted to identify whether there are potential risks to human and ecological receptors within the RoW associated with the presence of PHC impacts in groundwater. For the purposes of the SLRA, only receptors present within the RoW were considered. After screening these contaminants of concern (COCs) against their respective applicable human health MOECC Table 3 component values, no COCs were retained for further consideration and no risks were identified for human receptors. Pathways for ecological receptors were considered to be incomplete; therefore, no risks were identified.

2015 Groundwater Monitoring and Sampling, Golder, 2016

A groundwater monitoring and sampling investigation was carried out by Golder including monitoring and sampling groundwater at seven monitoring wells (TH8, TH9, TH11, TH12 and TH100 to TH102), no groundwater sample was collected from TH10. Groundwater samples were analysed for PHC F1 to F4, hexane and lead. Groundwater concentrations exceeded the Table 3 Standards for one or more of PHC fractions F1 to F4 at TH9, TH11, TH12, TH101 and TH102. The remaining groundwater samples reported concentrations below the Table 3 Standards.

2016 Groundwater Monitoring and Sampling, Golder, 2016

A groundwater monitoring and sampling investigation including decommissioning of TH10 and replacing it as MW16-01 was carried out by Golder. Groundwater was sampled at eight monitoring wells (TH8, TH9, TH11, TH12, TH100 to TH102 and MW16-01). Groundwater samples were analysed for PHC F1 to F4, hexane and lead.

Groundwater concentrations exceeded the Table 3 Standards for one or more of PHC fractions F1 to F4 at TH9, TH11, TH12, TH101 and TH102. The remaining groundwater samples reported concentrations below the Table 3 Standards.

Proposed Contaminant Management Plan

In accordance with the TSSA EMP, Imperial will continue to manage the petroleum-related impacts per the following proposed CMP:

- Off-Site monitoring wells (MW16-01, TH8, TH9, TH11, TH12, TH100 to TH102) will be monitored for subsurface vapour concentrations, depth to groundwater level and the presence of LNAPL on an annual basis.
- Sampling of off-Site monitoring wells (MW16-01, TH8, TH9, TH11, TH12, TH100 to TH102) for petroleum related parameters (BTEX, PHC F1-F4 and lead) on an annual basis.
- Preparation of one annual report including the analytical results to be provided to the City of Ottawa.

Rationale for Proposed Contaminant Management Plan

The following rationale is provided for the above noted CMP:

Extent and severity of Petroleum-related Contamination

- Based on the findings of previous assessments, the full extent of off-Site soil petroleum related impacts in the overburden soil have been delineated. Parameters analyzed at the extent of the contaminant plume were below the Table 3 Standards or not detected.
- The full extent of off-Site petroleum related impacts in groundwater has not been delineated to the north and east. Off-Site groundwater impacts at TH8, MW16-01 and TH100 have been delineated to the north and northeast. Off-site impacts at TH9, TH11, TH12, TH101 and TH102 have been evaluated as part of a SLRA and the petroleum related parameters exceeding the applicable Table 3 Standards are considered to not pose risk to human receptors and pathways for ecological receptors were considered to be incomplete; therefore, no risks were identified. LNAPL has not been detected in the monitoring wells investigated.
- Due to the direction of groundwater flow, towards the property at 1660 Merivale road, the exceedances noted in the ROW are considered up- or cross gradient from the property at 1660 Merivale road. No further investigation of this exceedance is currently proposed.

Acknowledgement from off-Site Property Owners

The City of Ottawa is hereby being notified of the environmental conditions in the public right of way adjacent to the property at 1660 Merivale Road, including our proposal to implement the CMP as it pertains to the public right of way.

We request that you provide written acknowledgement of the CMP proposed to be implemented.

Limitation of Liability, Scope of Report and Third Party Reliance

This report has been prepared and the work referred to in this report has been undertaken by Golder Associates Ltd. for Imperial Oil Limited. It is intended for the sole and exclusive use of Imperial Oil Limited, its affiliated companies and partners and their respective insurers, agents, employees and advisors (collectively, Imperial Oil). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and Golder Associates Ltd. make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by Golder Associates Ltd. with respect to this report and any conclusions or recommendations made in this report reflect Golder Associates Ltd.'s judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of Golder Associates Ltd. Nothing in this report is intended to constitute or provide a legal opinion.

Closure

We trust this letter provides you with sufficient information at this time, if you have further questions regarding this letter, please contact the undersigned.

Imperial Oil Limited
505 Quarry Park Boulevard SE
Calgary, Alberta, T2C 5N1

THIS REPORT CONTAINS PROVISIONS LIMITING LIABILITY, THE SCOPE OF THE REPORT AND THIRD PARTY RELIANCE

These documents and the information contained therein are confidential property of Imperial Oil Limited and any disclosure of same is governed by the provisions of each of the applicable provincial and territorial freedom of information legislation, the Privacy Act (Canada) 1980-81-83, c.111, Sch. II"1", and the Access to Information Act (Canada) 1980-81-82-83, c.111, Sch.I"1", as such, legislation may be amended from time to time.

2016 GROUNDWATER MONITORING AND SAMPLING REPORT
FORMER IMPERIAL OIL RETAIL FUEL OUTLET
1660 MERIVALE ROAD, OTTAWA, ONTARIO
SAP NO. 88001627

The Site location is presented in Figures 1 through 4.

GROUNDWATER MONITORING AND SAMPLING EVENT(S):

- August 9 and 10 and December 5, 2016.

SCOPE OF WORK

- Monitoring all 9 accessible on-Site groundwater monitoring wells for vapour concentrations, depth to groundwater and the thickness, if present, of Light Non-Aqueous Phase Liquid (LNAPL);
- Collecting groundwater samples from 9 on-Site monitoring wells using the low-flow sampling method for laboratory analysis of Benzene, Toluene, Ethylbenzene, Xylenes (BTEX), Petroleum Hydrocarbon (PHC) Fractions F1 to F4, hexane and lead;
- Comparing analytical chemistry data from the groundwater samples to the Ontario Ministry of the Environment and Climate Change (MOECC) standards considered to be applicable at the Site, Table 3 full depth generic site condition standards in a non-potable groundwater condition for medium and fine textured soils, for all types of property use from the MOECC document titled "Soil, Ground Water, and Sediment Standards for Use Under Part XV.1 of the *Environmental Protection Act,"* dated April 15, 2011 (hereafter referred to as the Table 3 Standards).

METHODOLOGY

Combustible Gas Detector Calibrations and Headspace Concentrations

- Headspace vapour concentrations were measured using an RKI Eagle® Combustible Organic Vapour Monitor (OVM) with methane elimination. The OVM was bump tested daily to 15% lower explosive limit using a hexane standard. If the bump test differed more than 10% from the known concentration, the OVM was adjusted to match the exact concentration of the calibration gas. Calibrations were logged at the start of each day.

Golder, Golder Associates and the GA globe design are trademarks of Golder Associates Corporation.

- Vapour concentrations were taken from inside each well casing by placing the OVM nozzle about 15 to 30 cm below the Top Of Casing (TOC). The OVM reading was taken immediately after the cap had been removed from the top of the monitoring well casing, in order to minimize the loss of volatiles from within the casing. The peak OVM reading was recorded.

Depth to Groundwater and LNAPL Thickness

- Depth to groundwater was measured and, if present, the thickness of LNAPL using an oil/water interface probe. If LNAPL is detected, then its presence is confirmed visually using a bailer. Prior to use in each well, the interface probe was cleaned using a phosphate-free detergent and water solution and rinsed with distilled water to minimize the potential for cross-contamination. Depth to groundwater measurements were taken from the TOC.

Low Flow Sampling

Groundwater samples were collected from 9 monitoring wells (TH1 to TH7, MW15-01 and MW15-02) using the low flow sampling technique. Groundwater was pumped from each well, at a rate of 0.1 to 1 L/min, using Waterra® High Density Polyethylene (HDPE) tubing connected to a peristaltic pump with a portion of silicone tubing. Routine water quality indicator parameters were measured during the pumping using a multi-parameter monitoring device and flow-through cell. The parameters measured included dissolved oxygen, electrical conductivity, pH, temperature and redox potential. Calibration of the multi-parameter monitoring device was completed as per the manufacturer's instructions. Purged water was collected in drums and removed from Site.

Twelve samples, including one duplicate sample, one field blank, one trip blank and nine groundwater samples were collected. TH1 was resampled on December 5, 2016.

Laboratory Analysis of Groundwater Samples

- The samples were submitted under chain-of-custody to Maxxam Analytics Inc. in Mississauga, Ontario, for analysis of BTEX, PHC Fractions F1 to F4, hexane and lead.

- Groundwater samples for BTEX, PHC Fraction F1 and hexane analysis were placed in 44-mL clear glass vials provided by the laboratory and preserved with sodium bisulphate as a microbial inhibitor. The groundwater samples for PHC Fraction F2 to F4 analysis were placed in 500-mL amber glass bottles and preserved with sodium bisulphate. Groundwater samples for dissolved lead parameters were placed in 250-mL plastic bottles that were field filtered and preserved with nitric acid.

- Sampling containers were preserved in ice-filled coolers and transported to Maxxam for chemical analysis.

RESULTS

Monitoring Well Headspace Vapour (Date; Range)

- August 9, 2016; Not detected to 85 parts per million by volume (Table 1).

- December 5, 2016; Not detected (Table 1).

LNAPL Occurrence (Date; Observations)

- August 9, 2016; Not detected in any of the monitoring wells (Table 1).

- December 5, 2016; Not detected in TH1 (Table 1).

Groundwater Monitoring (Date; Depth to Groundwater Range; Groundwater Direction)

- August 9, 2016; Depth to groundwater levels ranged from 2.50 to 4.17 metres below ground surface (mbgs) (Table1); South (Figure 4).
- December 5, 2016; Depth to groundwater at TH1 was 3.69 mbgs (Table 1). Groundwater flow direction not inferred due to water level being measured at only one well.

Groundwater Analytical Results (Date; Parameters; No. of wells)

- August 9, 2016; BTEX, PHC F1 to F4, hexane and lead; Exceedances of PHC F1, F2, F3 and/or F4 at four monitoring wells (Figure 5 and Table 2).
- December 5, 2016; BTEX, PHC F1 to F4 and lead; Non-detect at TH1 (Figure 5 and Table 2).

QUALITY ASSURANCE/QUALITY CONTROL

- Copies of the associated laboratory certificates of analysis are provided in Appendix A.
- Based on the data quality review, no data quality issue were identified that would have a material effect on the reliability of the data (Appendix B).

CLOSURE

We trust the information presented in this report meets your current requirements. Please contact the undersigned at (403) 299-5600 if you require additional information.

Yours truly,

Notes:

[(a)] TH1 to TH5 and TH7 elevations are relative to local benchmark (centre of storm sewer catch basin located approximately 5 metres west of kiosk).
assigned elevation = 100.00 m (exp, 2013)

[(a)] MW15-01 , MW15-02 and TH6 elevations are relative to local benchmark (ground surface at TH7).
assigned elevation = 99.66 m (exp, 2013)

masl - metres above sea level

mbtoc - metres below top of casing

mm - millimetres

nd - not detected

ppmv - parts per million by volume

nm - not measured

na - not accessible

Notes:

[a] O.Reg 153 (2011) Table 3 Full Depth Generic Site Condition Standards for all types of property use for groundwater in medium and fine textured soil in in a non-potable ground

[b] Baseline was not reached at Carbon 50. Value presented corresponds to F4G

[c] F1 fraction does not include BTEX; however, the proponent has the choice as to whether or not to subtract BTEX from the analytical result.

Bold/Underlined - value exceeds criteria/standard

BTEX - benzene, toluene, ethylbenzene, xylenes

F1, F2, F3, F4 - petroleum hydrocarbon fractions 1, 2, 3 and 4

RDL - reportable detection limit

µg/L - micrograms per litre

< - less than

na - not analyzed

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.0°C

The following bottles contained visual sediment, which was included in the analysis as per the Protocol for Analytical Methods Use in the Assessment of Properties under part XV.1 of the Environmental Protection Act.

For Sample TH5:
1 x 250 mL amber glass bottle for F4G contains 1.4 cm of sediment.
1 of 2 and 2 of 2 x 250 mL amber glass bottles for F2-F4 contains 1.5 and 1.8 cm of sediment, respectively.

For Sample TH1:
1 x 250 mL amber glass bottle for F4G contains 2.0 cm of sediment.
1 of 2 and 2 of 2 x 250 mL amber glass bottles for F2-F4 contain 2.5 and 2.6 cm of sediment, respectively.
2nd of 2 x 40mL clear glass vials for F1BTEX contains 1.2 cm of sediment.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6G9951

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within
Trip Blank Concentration			X	alert limits.
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: August 9, 2016

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6G9952

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were collected.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Dissolved Metals by ICPMS	3	CAM SOP-00447	EPA 6020A m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: August 10, 2016

Location: 1660 Merivlae Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6H0949

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were collected.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B6H0953
Received: 2016/08/12, 11:39

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	2	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	2	CAM SOP-00316	CCME PHC-CWS m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6H0953

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration	X			All field QC samples are within
Trip Blank Concentration	X			alert limits.
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

Dissolved Metals by ICPMS	1	CAM SOP-00447	EPA 6020B m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected. All samples were analyzed within hold time unless otherwise flagged.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods. Results relate to samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

APPENDIX B QUALITY ASSURANCE/QUALITY CONTROL

QUALITY ASSURANCE/QUALITY CONTROL

In conjunction with the field investigations completed to date, a Quality Assurance/Quality Control (QA/QC) program was implemented to ensure the integrity of the soil and groundwater sampling and analytical testing results.

1.0 FIELD PROGRAM

All sampling activities were completed in accordance with Golder's Technical Field Procedures by trained Golder personnel. All field activities were documented in field notes and results were recorded on standard field forms. All field equipment involved in sampling and monitoring was decontaminated in accordance with Golder's Technical Procedures. Soil and groundwater samples were collected using appropriate handling protocols and were placed in sample containers provided by Maxxam Analytics Inc. (Maxxam).

All re-useable field equipment involved in collecting samples was decontaminated between each sampling location. To help prevent cross-contamination, a new pair of clean nitrile gloves was used for the collection of each sample.

Samples were given unique identification numbers and the sampling containers were preserved in ice-filled coolers. Samples were logged onto formal chain-of-custody documents and transported to Maxxam's Mississauga Laboratory for chemical analysis. Maxxam's Mississauga laboratory is accredited by the Standards Council of Canada (SCC).

Blind field duplicate samples were submitted for analysis. Trip and field blanks were submitted for analysis, as necessary, to evaluate the potential for cross-contamination during the sampling and transportation of the samples. Submission of blind field duplicate QC samples was at a minimum rate of 10% of total samples.

2.0 LABORATORY PROGRAM

The laboratory QA/QC program included adherence to laboratory sampling and analysis protocols (e.g., hold times, sample containers, preservatives, detection limits and approved methodology) and the analysis of laboratory method blanks, laboratory sample duplicates, surrogate recovery and chemical spikes.

The laboratory method blank analysis results were used to detect interferences or impurities introduced by the laboratory equipment, reagents, or solvents. Surrogate recovery is analyzed for organics by spiking samples with known quantities of surrogate chemicals which have similar chemical properties to the parameters being analyzed. The reported recovery provides an indication of the analytical method accuracy for that sample. Matrix spikes were conducted by adding known concentrations of the analyte of interest to a sample to evaluate the effects of the sample matrix on the analytical method. The analysis of selected samples in duplicate is used to evaluate the reproducibility of the analytical method.

4.0 DATA RECEPTION

Once laboratory analytical results were received, Golder completed a review of field and laboratory quality. This included review of laboratory QC performance to confirm results are within acceptance criteria, as well as evaluation of field duplicate and blank results to confirm they were within alert limits. Upon receipt of the analytical results, Relative Percent Difference (RPD) values between the original samples and their blind field duplicates were calculated as follows:

$$RPD = \frac{|x_2 - x_1|}{\left(\frac{x_1 + x_2}{2}\right)} \times 100$$

Where: RPD = relative percent difference
X_2 = sample value
X_1 = blind field duplicate or replicate value.

Since analytical error increases near the Reportable Detection Limit (RDL), an RPD was only calculated where the concentrations of both the original and blind field duplicate samples were greater than five times the RDL. The calculated RPDs were then compared to parameter specific alert limits.

Exceedances of the QC acceptance or alert criteria were investigated with the laboratory and, if warranted, a corrective action report was requested from the laboratory.

5.0 DATA QUALITY REVIEW RESULTS

Results of the data quality review are summarized in Table D1. The RPD calculations and QC results are presented in Table D2 and D3.

One groundwater field duplicate sample was submitted to the laboratory for analysis of BTEX, PHC F1 to F4, Lead, and hexane as part of the groundwater QC program.

Based on the data quality review, no data quality issue were identified that would have a material effect on the reliability of the data.

Additional information is provided in Table D1.

6.0 SUMMARY OF RESULTS

Based on the review of the QA/QC results, the data presented in this report are considered to be reliable.

2016 GROUNDWATER MONITORING AND SAMPLING REPORT ADJACENT TO 1660 MERIVALE ROAD, OTTAWA, ON (SAP NO. 88001627)

INTRODUCTION

Golder Associates Ltd. (Golder) was retained by Imperial Oil Limited (Imperial) to conduct a groundwater monitoring and sampling program along the roadways of Viewmount Drive and Merivale Road adjacent to the north and east of the Imperial Oil site located at 1660 Merivale Road in Ottawa, Ontario (Figures 1 and 2). This area of Viewmount Drive and Merivale Road will henceforth be referred to as the subject property. The fieldwork was conducted between August 10 and 31, 2016.

Limitation of liability, scope of report and third party reliance is provided in Appendix A.

SCOPE OF WORK

The scope of work consisted of the following activities:

- Decommissioning TH10 and drilling a new monitoring well (MW16-01) 1.25 metres (m) south of TH10;
- Monitoring seven existing monitoring wells (TH8, TH9, TH11, TH12, TH100, TH101 and TH102) and one new monitoring well (MW16-01) (Figure 3) for vapour concentrations, depth to groundwater and the thickness, if present, of light non-aqueous phase liquids (LNAPLs);
- Collecting groundwater samples from seven existing and one new monitoring wells using low-flow sampling methods;
- Submitting groundwater samples for analysis of benzene, toluene, ethylbenzene, xylene (BTEX), petroleum hydrocarbons (PHCs) fractions F1 to F4, hexane and lead;
- Implementing a quality assurance and quality control (QA/QC) program; and,
- Comparing analytical chemistry data from the groundwater samples to the Ontario Ministry of the Environment and Climate Change (MOECC) standards considered to be applicable at the subject property, Table 3 full depth generic site condition standards in a non-potable groundwater condition for medium and fine textured soil, all types of property use of the MOECC document titled "Soil, Ground Water, and Sediment Standards for Use Under Part XV.1 of the *Environmental Protection Act,"* dated April 15, 2011 (hereafter referred to as the Table 3 Standards).

METHODOLOGY

Monitoring Well Decommissioning

TH10 was found to be blocked and unusable during the 2015 monitoring and sampling event. TH10 was decommissioned on August 24, 2016 by vacuuming out the well casing to remove debris from the casing, filling the casing with hydrated bentonite chips, to approximately 1.3 mbgs, hydrated bentonite seal was placed from 1.3 to 0.3 mbgs and sand was used to fill the top 0.3 m with asphalt cold patch covering to match the existing road grade.

Monitoring Well Drilling and Installation

One borehole was drilled at the Site and completed as a monitoring well (MW16-01). Prior to drilling, the borehole was hydro-vacuumed to 2.4 mbgs for utility clearance. The hydrovac truck was operated by Badger Daylighting Inc. of Ottawa. Borehole drilling was completed using a GeoProbe drill rig using a diamond core bit. The drill rig was operated by Strata Drilling of Ottawa.

Soil samples were not collected during drilling since the borehole was completed in bedrock below the hydrovac hole. The borehole was completed as a monitoring well. The monitoring well was constructed of 50-mm diameter, Schedule 40 polyvinyl chloride screen and solid riser. The well completion zone consisted of 0.010-inch slot screen, and 10-20 silica sand was placed around the screen to a level of 0.3 m above the top of the screen. Well annuli above the sand pack were sealed with hydrated bentonite chips. The monitoring well was completed with a flush mount casing set in concrete.

The monitoring well locations are presented on Figure 3. The borehole log and well completion details are presented in Appendix B.

Monitoring Well Development

Following drilling and prior to groundwater sampling, the newly-installed well was developed by removing the equivalent of three well volumes of water from the well. High density polyethylene (HDPE) tubing and a surge block were used to develop the monitoring well. Surge blocking was used for developing the monitoring well in order to set the sand pack and to reduce the amount of sediment in the groundwater. Purged water was retained on-site in a 205-L barrel. Once the field program was completed, the barrel was transported off-site and properly disposed at an approved facility.

Combustible Gas Detector Calibrations and Headspace Concentrations

Headspace vapour concentrations were measured using a combustible organic vapour meter (OVM). The OVM was rented from and calibrated by Pine Environmental.

Vapour concentrations were taken from inside each well casing by placing the OVM nozzle about 15 to 30 centimetres (cm) below the top of casing (TOC). The OVM reading was taken immediately after the cap had been removed from the top of the monitoring well casing in order to minimize the loss of volatiles from within the casing. The peak OVM reading was recorded.

Depth to Groundwater and LNAPL Thickness

Depth to groundwater was measured and, if present, the thickness of LNAPLs was measured using an oil/water interface probe. If LNAPLs were detected, then its presence was confirmed visually using a bailer. Prior to use in each well, the interface probe was cleaned using a phosphate-free detergent and deionized water solution, then rinsed with distilled water to minimize the potential for cross contamination. Depth to groundwater measurements were taken from the TOC.

Low Flow Groundwater Sampling

Groundwater samples were collected from TH8, TH9, TH11, TH12, TH100, TH101, TH102 and MW16-01 using the low flow sampling technique. Water was pumped from each well, at a rate of 0.1 to 1 L/min, using low density polyethylene (LDPE) tubing connected to a peristaltic pump with a portion of silicone tubing. Routine water quality indicator parameters were measured during the pumping using a multi-parameter water quality meter with a flow-through cell. The parameters measured included EC, pH and temperature. Calibration of the instrument was completed as per the manufacturer's instructions. Eleven samples, including one duplicate, one field blank, one trip blank and eight groundwater samples, were collected in total. Purged water was collected in a drum for removal from subject property. The liquid was picked up by Badger Daylighting Inc. (Badger), a MOECC licensed waste hauler, and disposed of at the Tomlinson Environmental Services Ltd. Industrial Waste Division waste receiving facility on Power Road in Ottawa, Ontario, a MOECC approved waste receiver.

Laboratory Analysis of Groundwater Samples

- The samples were submitted under chain-of-custody to Maxxam Analytics Inc. (Maxxam) in Mississauga, Ontario, for analysis of BTEX and PHC Fractions F1 to F4, hexane and lead. The sample from MW16-01 was not analysed for hexane.
- Groundwater samples for BTEX, PHC Fraction F1 and hexane analysis were placed in 44-mL clear glass vials provided by the laboratory and preserved with sodium bisulphate as a microbial inhibitor. The groundwater samples for PHC Fraction F2 to F4 analysis were placed in 250-mL amber glass bottles and preserved with sodium bisulphate. The groundwater samples for lead were placed in laboratory-supplied 120 mL plastic bottles and preserved with nitric acid.
- Sampling containers were preserved in ice-filled coolers and transported to Maxxam for chemical analysis.

Quality Assurance and Quality Control

A QA/QC program was followed to minimize and quantify impacts introduced during sample collection, handling, shipping and analysis. As part of the QA/QC program, sampling protocols included minimizing sample handling, submitting field QA/QC samples, using dedicated non-contaminating sampling equipment, using sample-specific identification and labelling procedures, and using chain-of-custody records.

RESULTS

Monitoring Well Headspace Vapour (Date; Range)

- August 10 - 31, 2016; not detected to 100% LEL (Table 1).

LNAPL Occurrence (Date; Observations)

- August 10 - 31, 2016; Not detected (Table 1).

Groundwater Monitoring (Date; Depth to Groundwater Range; Groundwater Direction)

- August 10 - 31, 2016; Depth to shallow groundwater level was 2.88 to 3.68 metres below ground surface (mbgs) (Table1); groundwater flow direction could not be determined (Figure 4).

Groundwater Analytical Results (Date; Parameters; No. of wells)

- August 10 - 31, 2016; BTEX, PHC Fractions F1 to F4, hexane and lead; exceedances of PHC Fractions F1 to F4 at five monitoring wells (Table 2 and Figure 5).

QUALITY ASSURANCE/QUALITY CONTROL

- Copies of the associated laboratory certificates of analysis are provided in Appendix C.
- No data quality issues were identified. The data presented in this report are considered to be reliable (Appendix D).

CLOSURE

We trust the information provided herein meets your requirements. If you have any questions about the contents of the letter, please contact the undersigned.

Notes:

[a] O.Reg 153 (2011) Table 3 Full Depth Generic Site Condition Standards for all types o property use for groundwater in medium and fine textured soil in in a non-potable ground water condition

[b] F1 fraction does not include BTEX; however, the proponent has the choice as to whether or not to subtract BTEX from the analytical result

Bold/Underlined - value exceeds criteria/standard

BTEX - benzene, toluene, ethylbenzene, xylenes

F1, F2, F3, F4 - petroleum hydrocarbon fractions 1, 2, 3 and 4

RDL - reportable detection limit

µg/L - micrograms per litre

< - less than

NA - not analyzed

APPENDIX A LIMITATIONS OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY REVIEW

LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by Golder Associates Ltd. for Imperial Oil Limited. It is intended for the sole and exclusive use of Imperial Oil Limited, its affiliated companies and partners and their respective insurers, agents, employees and advisors (collectively, Imperial Oil). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and Golder Associates Ltd. make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by Golder Associates Ltd. with respect to this report and any conclusions or recommendations made in this report reflect Golder Associates Ltd.'s judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of Golder Associates Ltd. Nothing in this report is intended to constitute or provide a legal opinion.

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: August 10, 2016

Location: 1660 Merivlae Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6H0949

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were collected.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B6H0953
Received: 2016/08/12, 11:39

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	2	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	2	CAM SOP-00316	CCME PHC-CWS m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Golder Associates

Sampling Date: August 11, 2016

Location: 1660 Merivale Road, Ottawa, ON

Laboratory: Maxxam Analytics Mississauga

Consultant Project Number: 1544125-1155

Sample Submission Number: B6H0953

Are All Laboratory QC Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC results are within
Extraction Surrogate Recovery	X			acceptance criteria.
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration	X			All field QC samples are within
Trip Blank Concentration	X			alert limits.
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 24 hours (Yes/No)?:	n/a
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: n/a

Date of Response: n/a

Is data considered to be reliable (Yes/No/Suspect)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B6H0955
Received: 2016/08/12, 11:39

Sample Matrix: Water
Samples Received: 5

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	5	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	5	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	5	CAM SOP-00447	EPA 6020A m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B6I8170
Received: 2016/09/02, 07:57

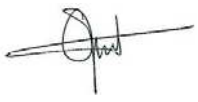
Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	1	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1)	1	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	1	CAM SOP-00447	EPA 6020A m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.



All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

APPENDIX D QUALITY ASSURANCE/QUALITY CONTROL

QUALITY ASSURANCE/QUALITY CONTROL

In conjunction with the field investigations completed to date, a Quality Assurance/Quality Control (QA/QC) program was implemented to ensure the integrity of the soil and groundwater sampling and analytical testing results.

1.0 FIELD PROGRAM

All sampling activities were completed in accordance with Golder's Technical Field Procedures by trained Golder personnel. All field activities were documented in field notes and results were recorded on standard field forms. All field equipment involved in sampling and monitoring was decontaminated in accordance with Golder's Technical Procedures. Soil and groundwater samples were collected using appropriate handling protocols and were placed in sample containers provided by Maxxam Analytics Inc. (Maxxam).

All re-useable field equipment involved in collecting samples was decontaminated between each sampling location. To help prevent cross-contamination, a new pair of clean nitrile gloves was used for the collection of each sample.

Samples were given unique identification numbers and the sampling containers were preserved in ice-filled coolers. Samples were logged onto formal chain-of-custody documents and transported to Maxxam's Mississauga Laboratory for chemical analysis. Maxxam's Mississauga laboratory is accredited by the Standards Council of Canada (SCC).

Blind field duplicate samples were submitted for analysis. Trip and field blanks were submitted for analysis, as necessary, to evaluate the potential for cross-contamination during the sampling and transportation of the samples. Submission of blind field duplicate QC samples was at a minimum rate of 10% of total samples.

2.0 LABORATORY PROGRAM

The laboratory QA/QC program included adherence to laboratory sampling and analysis protocols (e.g., hold times, sample containers, preservatives, detection limits and approved methodology) and the analysis of laboratory method blanks, laboratory sample duplicates, surrogate recovery and chemical spikes.

The laboratory method blank analysis results were used to detect interferences or impurities introduced by the laboratory equipment, reagents, or solvents. Surrogate recovery is analyzed for organics by spiking samples with known quantities of surrogate chemicals which have similar chemical properties to the parameters being analyzed. The reported recovery provides an indication of the analytical method accuracy for that sample. Matrix spikes were conducted by adding known concentrations of the analyte of interest to a sample to evaluate the effects of the sample matrix on the analytical method. The analysis of selected samples in duplicate is used to evaluate the reproducibility of the analytical method.

3.0 DATA RECEPTION

Once laboratory analytical results were received, Golder completed a review of field and laboratory quality. This included review of laboratory QC performance to confirm results are within acceptance criteria, as well as evaluation of field duplicate and blank results to confirm they were within alert limits. Upon receipt of the analytical results, Relative Percent Difference (RPD) values between the original samples and their blind field duplicates were calculated as follows:

$$RPD = \frac{|x_2 - x_1|}{\left(\frac{x_1 + x_2}{2}\right)} \times 100$$

Where: RPD = relative percent difference
X_2 = sample value
X_1 = blind field duplicate or replicate value.

Since analytical error increases near the Reportable Detection Limit (RDL), an RPD was only calculated where the concentrations of both the original and blind field duplicate samples were greater than five times the RDL. The calculated RPDs were then compared to parameter specific alert limits.

Exceedances of the QC acceptance or alert criteria were investigated with the laboratory and, if warranted, a corrective action report was requested from the laboratory.

4.0 DATA QUALITY REVIEW RESULTS

Results of the data quality review are summarized in Table D1. The RPD calculations and QC results are presented in Table D2 and D3.

One groundwater field duplicate sample was submitted to the laboratory for analysis of BTEX, PHC F1 to F4, Lead, and hexane as part of the QC program.

Based on the RPD calculations, the field duplicate samples TH11 and DUP B exceed the alert limit for dissolved lead (58%). A quality check of the data yielded similar results. Dissolved lead concentrations in both the sample and the field duplicate were below the regulatory standard, indicating that there will not be a material effect on the interpretation of the results of this parameter. Under these circumstances, the dissolved lead data reported can be considered reliable.

Additional information is provided in Table D1.

5.0 SUMMARY OF RESULTS

Based on the review of the QA/QC results, the data presented in this report are considered to be reliable.

SCREENING LEVEL RISK ASSESSMENT
RIGHT-OF-WAY ADJACENT TO 1660 MERIVALE ROAD, OTTAWA, ON (SAP NO. 88001627)

INTRODUCTION

Golder Associates Limited (Golder) was retained by Imperial Oil Limited (Imperial) to conduct a screening level risk assessment (SLRA) for the Right-of-Way (RoW) located adjacent to 1660 Merivale Road in Ottawa, Ontario (referred to as the Site), as shown on Figures 1 and 2. The purpose of the SLRA is to identify if soil and groundwater concentrations present within the RoW represent a risk to above ground receptors or workers who may be required to conduct subsurface work.

Based on the results of the environmental assessments (ESAs) completed at the Site by exp Energy Services Ltd. (exp) and Golder (2016), exceedances of petroleum hydrocarbon (PHC) fractions F1 to F4 in groundwater were identified within the RoW. These exceedances were identified based on a comparison to the Ministry of Environment and Climate Change (MOECC) fine-grained standards based on grain-size analyses completed at the adjacent site (1660 Merivale Road). A review of the borehole logs for the boreholes advanced within the RoW was completed as part of the SLRA. Subsurface conditions were reported to consist predominately of sand and gravel fill in the RoW (i.e., coarse-grained material). Given that vapour migration can occur more readily through coarse-grained material, and in consideration of the subsurface worker that may be working in a trench within the RoW, comparison to the coarse-textured standards is considered to be more conservative and appropriate in the SLRA. As such, identification of contaminants of concern (COCs) in this SLRA is based on a comparison of maximum measured concentrations of soil and groundwater within the RoW to the MOECC Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act, Table 3: Full Depth Generic Site Condition Standards in a Non-Potable Ground Water Condition, Commercial/ Industrial/Community Property Use, coarse-textured soil, April 15, 2011 (Ontario Table 3 Standards). No sheen or light non-aqueous phase liquid (LNAPL) were noted while conducting intrusive sampling during previous investigations (exp, 2013, exp, 2014) or during Golder's recent groundwater sampling event (Golder, 2016).

SCOPE OF WORK

As indicated above, the purpose of the SLRA is to identify whether there are potential risks to human health and the environment based on the maximum measured concentrations of PHCs in groundwater within the RoW. The

Golder Associates Ltd.
1931 Robertson Road, Ottawa, Ontario, Canada, K2H 5B7
Tel: +1 (613) 592 9600 Fax: +1 (613) 592 9601 www.golder.com

Golder Associates: Operations in Africa, Asia, Australasia, Europe, North America and South America

Golder, Golder Associates and the GA globe design are trademarks of Golder Associates Corporation.

scope of the SLRA is limited to a qualitative evaluation of potential risks to receptors present within the RoW and does not consider receptors present on adjacent properties that may be exposed to COCs migrating from the RoW via groundwater or vapour migration. It is not sufficient to be submitted as part of the process to obtain a Record of Site Condition (RSC). The SLRA is based on the results of current and previous investigations as well as current conditions within the RoW. In the case of any changes to the current conditions or if new data is collected, a re-evaluation of the SLRA will be required.

IDENTIFICATION OF CONTAMINANTS OF CONCERN

As indicated above, the use of coarse-grained standards were considered to be applicable for the identification of COCs in soil and groundwater within the RoW. The maximum measured concentrations of the parameters analyzed in soil and groundwater along with their respective MOECC Table 3 Standards are provided in Tables 1 and 2 below and shown on Figures 3 and 4. Select polycyclic aromatic hydrocarbon (PAH) parameters were analyzed in soil as part of the previous investigations by exp. Concentrations were below the laboratory detection limit, as such, they were not included in Table 1 below.

Table 1: Potential for Contaminants of Concern in Soil

Potential Contaminant of Concern	MOECC Table 3 Standard (µg/g)	Maximum Measured Concentration (µg/g)	Retain as COC?
Benzene	0.32	<0.020	No
Toluene	68	0.024	No
Ethylbenzene	9.5	<0.020	No
Xylenes	26	<0.040	No
Hexane	46	<0.5	No
Methyl tert-Butyl Ether	11	<0.05	No
PHC F1 (C6-C10)-BTEX	55	<10	No
PHC F2 (C10-C16)	230	<10	No
PHC F3 (C16-C34)	1700	120	No
PHC F4 (C34-C50)	3300	1700	No
Lead	120	14	No

Notes: BTEX - Benzene, toluene, ethylbenzene, xylene
PHC - Petroleum hydrocarbon
COC – Contaminant of concern
Bold indicates an exceedance of the applicable standard

Table 2: Potential Contaminants of Concern in Groundwater

Potential Contaminant of Concern	MOECC Table 3 Standard (µg/L)	Maximum Measured Concentration (µg/L)	Retain as COC?
Benzene	44	**380**	**Yes**
Toluene	18000	58	No
Ethylbenzene	2300	2300	No
Xylenes	4200	3500	No
Hexane	51	**130**	**Yes**
Methyl tert-Butyl Ether	190	0.75	No
PHC F1 (C6-C10)-BTEX	750	**11,000**	**Yes**
PHC F2 (C10-C16)	150	**3,100**	**Yes**

Potential Contaminant of Concern	MOECC Table 3 Standard (µg/L)	Maximum Measured Concentration (µg/L)	Retain as COC?
PHC F3 (C16-C34)	500	**1,300**	**Yes**
PHC F4 (C34-C50)	500	**820**	**Yes**
Lead	25	6.9	No

Notes: BTEX - Benzene, toluene, ethylbenzene, xylene
PHC - Petroleum hydrocarbon
COC – Contaminant of concern
Bold indicates an exceedance of the applicable standard

Based on the above, benzene, hexane and PHC F1 to F4 in groundwater were retained for further assessment in the SLRA. No COCs were identified in soil.

ASSESSMENT OF CONTAMINANTS OF CONCERN FOR HUMAN AND ECOLOGICAL HEALTH

The generic MOECC Site Condition Standards (SCS) (i.e., MOECC Table 3 Standards) have been established through the use of a number of component values. These component values have been developed to provide protection to a receptor or group of receptors from a contaminant via a specific pathway. Generally, the lowest value of the component values is then applied as the generic SCS. For the purpose of identifying COCs related specifically to human or ecological receptors, maximum measured concentrations of these COCs were compared to pathway specific guidelines for the protection of human health (referred to as human health component values) or the protection of ecological health (referred to as ecological component values). MOECC Table 3 component values for a non-potable groundwater scenario, commercial/industrial/community land use and fine-grained soil were used (MOECC, 2011).

Human Health

For human health, the screening against the MOECC Table 3 component values is shown below in Table 2. Groundwater in the area is not potable; therefore, exposure due to ingestion of potable groundwater is not applicable within the RoW. There are no buildings within the RoW; therefore, exposure due to inhalation of indoor air containing soil vapour from groundwater is not applicable. In the absence of component values for the inhalation of air in a trench containing soil vapour from groundwater for a subsurface worker, the GW2 component value was considered to be applicable. This component value is protective of humans coming into contact with volatile chemicals in groundwater through inhalation of indoor air containing soil vapour. Additionally, subsurface workers could potentially be exposed to groundwater from splashing or hand-to-mouth contact during subsurface work, if groundwater is encountered. The MOECC Table 2 GW1 component values for the ingestion of potable groundwater were conservatively applied with an adjustment factor of 100 as it was considered that the incidental ingestion of surface water was 100 times lower than the daily drinking water consumption rate (Virginia Department of Environmental Quality (VDEQ), 2014.

PHC F3 and F4 are not considered volatile, and as such, exposure pathways related to the inhalation of vapours were not considered in the SLRA for these parameters.

Table 3: Contaminants of Concern in Groundwater Screening Against Human Health Component Values

Contaminant of Concern	MOECC Component Values (µg/L)		Maximum Measured Concentration (µg/L)	Retain as COC?
	GW2[1]	GW1x100[2]		
Benzene	830	500	380	No
Hexane	980	NG	130	No
PHC F1 (C6-C10)-BTEX	28,000	82,000	11,000	No

Contaminant of Concern	MOECC Component Values (µg/L)		Maximum Measured Concentration (µg/L)	Retain as COC?
	GW2[1]	GW1x100[2]		
PHC F2 (C10-C16)	47,000	30,000	3,100	No
PHC F3 (C16-C34)	NA	100,000	1,300	No
PHC F4 (C34-C50)	NA	110,000	820	No

Notes: COC – Contaminant of concern
NA – Not applicable
NG – No guideline
GW2 – Human health component value for groundwater to indoor air (inhalation of indoor air)
GW1 – Human health component value for the ingestion of groundwater
1. MOECC Table 3 component value (GW2)
2. MOECC Table 2 component value (GW1) multiplied by an adjustment factor of 100 to account for incidental ingestion of groundwater

Prepared by: SR
Checked by: TR

As shown in Table 2, maximum measured concentrations of COCs in groundwater were below the GW2 and the adjusted GW1 component values and although the component values are above the solubility limits for PHC F1 and F2 no sheen or LNAPL were noted during the previous investigations therefore the COCs were not retained for further consideration. As such, risks were not identified for the subsurface worker.

Ecological Health

As indicated above, the SLRA is limited to a qualitative evaluation of potential risks to receptors present within the RoW. Given that the RoW is paved with a roadway, groundwater is not accessible to ecological receptors (e.g., plants, soil invertebrates, mammals and birds) and as such, risks were not identified for ecological receptors.

CONCLUSIONS/RECOMMENDATIONS

A SLRA was conducted to identify whether there are potential risks to human and ecological receptors within the RoW associated with the presence of PHC impacts in groundwater. For the purposes of the SLRA, only receptors present within the RoW were considered. After screening these COCs against their respective applicable human health MOECC Table 3 component values, no COCs were retained for further consideration and no risks were identified for human receptors. Pathways for ecological receptors were considered to be incomplete; therefore, no risks were identified.

As indicated above, no sheen or LNAPL were noted during the previous investigations at the locations investigated; however, conditions may vary between these locations. If evidence of sheen or LNAPL is noted during future excavation activities, sampling, laboratory analysis and evaluation of the results should be conducted to identify the appropriate actions required.

STATEMENT OF LIMITATIONS

This report has been prepared and the work referred to in this report has been undertaken by Golder Associates Ltd. for Imperial Oil Limited. It is intended for the sole and exclusive use of Imperial Oil Limited, its affiliated companies and partners and their respective insurers, agents, employees and advisors (collectively, Imperial Oil). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and Golder Associates Ltd. make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by Golder Associates Ltd. with respect to this report and any conclusions or recommendations made in this report reflect Golder Associates Ltd.'s judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of Golder Associates Ltd. Nothing in this report is intended to constitute or provide a legal opinion.

Re: 1660 Merivale Road, Ottawa, ON
Imperial Site Number: 302620
Interim Contaminant Management Plan

INTRODUCTION

Exp Energy Services Ltd. (**exp**) was retained by Imperial Oil Limited (Imperial) to prepare a contaminant management plan (CMP) to address subsurface petroleum hydrocarbon impacts for the property located at 1660 Merivale Road, in Ottawa, Ontario (henceforth referred to as the subject property). The subject property is located on southwest corner of Merivale Road and Viewmount Drive. The site is currently a retail gas station operated by Canadian Tire. The surrounding properties are used for commercial and institutional purposes. A locality plan and site plan are provided as Figures 1 and 2.

Exp prepared the CMP in accordance with the Technical Standards and Safety Authority (TSSA) August 2012 document entitled *Environmental Management Protocol for Fuel Handling Sites in Ontario* (EMP) and with generally accepted professional practices. Subject to this standard of care, **exp** makes no express or implied warranties regarding its services and no third party beneficiaries are intended. Limitation of liability, scope of report and third party reliance are outlined in Appendix A.

BACKGROUND

Barenco Inc (now **exp**) conducted an environmental assessment at the subject property, as detailed in the report Phase II *Environmental Assessment, 1660 Merivale Road, Ottawa, Ontario*, dated September 14, 2011. This assessment involved drilling five test holes (TH1 to

Professional Engineers Ontario

APGO ASSOCIATION OF PROFESSIONAL GEOSCIENTISTS OF ONTARIO

THIS REPORT CONTAINS PROVISIONS LIMITING LIABILITY, THE SCOPE OF THE REPORT AND THIRD PARTY RELIANCE

These documents and the information contained therein are confidential, property of Imperial Oil Limited and any disclosure of same is governed by the provisions of each of the applicable provincial and territorial freedom of information legislation, the Privacy Act (Canada) 1980-81-82-83, c.111, Sch. II"1", and the Access to Information Act (Canada) 1980-81-82-83, c.111, Sch .I"1", as such legislation may be amended from time to time.

TH5) across the site following the tank replacement program. Monitors were installed in all five of the test hole locations. The test hole locations are shown on Figure 2.

The Ontario Regulation 153/04, as amended, Table 3 standards for industrial/commercial/ community property use and medium and fine textured soils in a non-potable ground water condition were deemed to be appropriate for evaluating subsurface conditions at the subject property. These standards were selected based on the land use for the subject property, the absence of potable water use in the vicinity of the site and the soil grain size and pH analysis completed during the 2011 investigation.

Soil samples were collected from all five test holes and submitted for laboratory analysis. All of the soil samples were within the applicable Table 3 standards for petroleum-related parameters (benzene, toluene, ethylbenzene, xylenes [BTEX], n-hexane, petroleum hydrocarbon fractions [PHC] F1 to F4, and lead). Bedrock limestone was encounter at approximately 2.7 metres below grade surface (mbgs). No soil samples were submitted from the bedrock and the screens in the monitors were installed completely within in the bedrock. Ground water samples were collected from all five monitors and submitted for laboratory analysis. All of the ground water samples were within the applicable Table 3 standards for petroleum-related parameters except TH 3 to TH5. Ground water was determined to be between 3.0 to 4.0 mbgs, with ground water flow direction measured to be southwesterly. Soil and ground water analytical results are shown on Figures 3 and 4, respectively.

To delineate the impacts in TH3 to TH5, two additional test holes (TH6 and TH7) were advanced south (down-gradient) of TH5 in October 2011, as detailed in the report, *Baseline Environmental Assessement, 1660 Merivale Road, Ottawa, Ontario,* dated December 5, 2011. The additional test hole locations onsite are shown on Figure 2.

Soil samples were collected from both test holes and submitted for laboratory analysis. All soil samples were within the applicable Table 3 standards for all petroleum-related parameters analyzed. Bedrock was encountered at approximately 4.2 mbgs. No soil samples were submitted from the bedrock and the screens in the monitors were installed completely within in the bedrock. Ground water samples were collected from the newly installed existing monitoring wells and submitted for laboratory analysis. All of the ground water samples were within the applicable Table 3 standards for petroleum-related parameters. Soil and ground water analytical results for the additional test holes onsite are shown on Figures 3 and 4, respectively.

Hydraulic conductivity was conducted on existing monitors (TH2, TH3, and TH4) in the bedrock during this investigation, and was determined to 2.5 X 10^{-6} centimetres/ second (cm/s). The depth to ground water was determined to be between 3.7 and 5.0 mbgs, with the ground water flow direction estimated to be southeasterly.

Annual ground water monitoring and sampling of all onsite monitors was completed, as detailed in the report, *2013 Ground Water Monitoring and Sampling Report, 1660 Merivale*

Avenue, Ottawa, Ontario dated July 22, 2013. Ground water samples were collected from all onsite monitoring wells and submitted for laboratory analysis of petroleum-related parameters. All of the ground water samples were within the applicable Table 3 standards for petroleum-related parameters, except TH3 to TH5, and TH7. The depth to ground water was determined to be between 3.0 and 3.5 mbgs, with the ground water flow direction estimated to be southerly. Ground water analytical results are shown on Figure 4.

To further delineate the ground water impacts in TH3 to TH5 and TH7, five additional test holes (TH8 to TH12) were advanced to the north and east (up-gradient and cross-gradient) of the zone of impacts in the public right of way, as detailed in the report, *Phase II Environmental Assessement, Adjacent to 1660 Merivale Road, Ottawa, Ontario*, dated December 5, 2013. The additional test hole locations are shown on Figure 2.

Soil samples were collected from all offsite test holes and submitted for laboratory analysis. All soil samples were within the applicable Table 3 standards for all petroleum-related parameters analyzed. Bedrock was encountered at approximately 2.4 mbgs. No soil samples were submitted from the bedrock and the screens in the monitors were installed completely within in the bedrock. Ground water samples were collected from the newly installed offsite monitoring wells and submitted for laboratory analysis, with the exception of TH9, which was paved over before sampling could be completed. All of the ground water samples were within the applicable Table 3 standards for petroleum-related parameters, except TH10 to TH12. Soil and ground water analytical results for the additional test holes are shown on Figures 3 and 4, respectively.

Annual ground water monitoring and sampling of all onsite monitors was completed, as detailed in the report, *2014 Ground Water Monitoring and Sampling, 1660 Merivale Avenue, Ottawa, Ontario*, dated October 8, 2014. Ground water samples were collected from all onsite monitoring wells and submitted for laboratory analysis of petroleum-related parameters. All of the ground water samples were within the applicable Table 3 standards for petroleum-related parameters, except TH3 to TH5, and TH7 which exceeded for one or more petroleum-related parameters. The depth to ground water was determined to be between 3.0 and 4.0 mbgs with the ground water flow direction estimated to be southeasterly. Ground water analytical results are shown on Figure 4. A ground water contour plan from the most recent ground water sampling event, completed in August 2014, is shown as Figure 5.

To further delineate the offsite ground water impacts in TH10 to TH12, three additional test holes (TH100 to TH102) were advanced further east offsite (cross-gradient) of the subject property in the public right of way, as detailed in the report, *Supplemental Phase II Environmental Assessement, Adjacent to 1660 Merivale Road, Ottawa Ontario,* dated November 20, 2014. The additional test hole locations are shown on Figure 2.

Soil samples were collected from all new offsite test holes and submitted for laboratory analysis. All soil samples were within the applicable Table 3 standards for all petroleum related parameters analyzed (with the addition of MTBE). Bedrock was encountered at

approximately 2.4 mbgs. No soil samples were submitted from the bedrock and the screens in the monitors were installed completely within in the bedrock. Ground water samples were collected from the newly installed monitoring wells and submitted for laboratory analysis. Monitor TH9 was uncovered and inspected during this event; it was found to be in good condition and was repaired to grade and sampled. All of the ground water samples exceeded the applicable Table 3 standards for one or more petroleum-related parameters, except TH100. Soil and ground water analytical results for the additional test holes are shown on Figures 3 and 4, respectively.

The depth to ground water was determined to be between 3.0 and 3.6 mbgs, with the ground water flow direction estimated to be southwesterly. A ground water contour plan from the October 2014 event is shown as Figure 6.

PROPOSED CONTAMINANT MANAGEMENT PLAN

In accordance with the TSSA EMP, Imperial will continue to manage the petroleum-related impacts per the following proposed CMP:

- The on-site monitors (TH1 to TH7) and the off-site monitors (TH8 to TH12, and TH100 to TH102) will be inspected for subsurface vapour concentrations, ground water levels and the presence or absence of phase-separated liquid petroleum on an annual basis

- All on-site monitors (TH1 to TH7) and the off-site monitors (TH8 to TH12, and TH100 to TH102) will be sampled for petroleum related parameters (BTEX, F1 to F4, and lead) on an annual basis

- A report summarising the findings onsite will be provided to the TSSA annually

- A report summarising the findings of the off-site monitors (TH8 to TH12, and TH100 to TH102) will be provided to the City of Ottawa and the TSSA annually; TSSA will be copied on all relevant communications with the municipality

- Up to three additional test holes planned to be installed to further delineate offsite ground water impacts to the north (up-gradient) and east (cross-gradient) of the subject property. Timing of this work will depend upon third party access

- Up to two additional test hole will be installed on the subject property to the south of TH7 (down- gradient), to further delineate ground water impacts. Delineation work is planned for 2015

RATIONALE FOR PROPOSED CMP

We rationalize the above noted proposed CMP based on the following:

Extent and Severity of Petroleum-Related Contamination

- Based on previous assessment findings, the full extent of on- and offsite soil petroleum-related impacts in the overburden soil above the native limestone bedrock have been delineated. Parameters analyzed, which includes lead, were either well below the Table 3 standards or non-detectable

- Based on the previous assessment findings, the full extent of the on- and offsite petroleum-related impacts in ground water have not been delineated to the north, south, and east

- MTBE and n-hexane have been removed from the parameters to be analyzed, as on and offsite results for those parameters have been either non-detectable or well below the applicable Table 3 Standards

Receptor Evaluation

- There is no likelihood of adverse effect from soil or ground water impacts to on- or off-site receptors:

    - The concentrations of petroleum-related parameters in soil at the subject property boundaries east and southeast of the kiosk, pump island and underground storage tanks are below the applicable Table 3 soil standards

    - The concentrations of petroleum-related parameters in ground water at the property boundaries and east of the subject property boundary are above the applicable Table 3 ground water standards

    - Concentration of petroleum-related parameters in ground water on- and offsite delineation wells (TH7, TH9, TH10, TH101 and TH102) are below the applicable MOECC GW2 MGRA component value for residential property use and well below the GW2 MGRA component value for commercial property use for all on- and offsite monitors. Thus impacts from vapour intrusion due to ground water impacts on- and offsite are a low risk to on-site receptors and surrounding properties

    - Ground water is contained in the limestone bedrock on and offsite at depths between 3.0 and 4.0 mbgs

- Impacts in ground water will not migrate to potable wells, as the site and surrounding properties are supplied by municipal water. The source of municipal water is the Ottawa River, according to the City of Ottawa. The Ottawa River is located over 5 km north of the subject property. A search of water well records revealed the possibility of one water well within 250 metres of the subject property. It was installed in 1953 at a house that was present in a 1952 air photograph. The house is no longer present. Therefore, it is our opinion that there are no potable water receptors within 250 metres of the subject property

- There is no risk of ground water migration to a surface water body, as the subject property is located more than 3.6 kilometres southeast of the nearest surface water receptor (Nepean Creek)

Contaminant Migration Evaluation

- The mean hydraulic conductivity of the water within onsite monitors was determined to be 2.5 X 10^{-6} cm/s. Ground water velocity has been calculated to be 19 cm/year towards the southeast

- Once enough ground water data has been collected onsite (a minimum of 4 sampling events with reliable data), a Mann-Kendall Trend analysis of onsite results be completed, to determine the ground water plume trend

Acknowledgement from Off-Site Property Owners

- The City of Ottawa has been notified, in writing, of the environmental conditions in the public right of way to the east of the subject property and will receive our proposal to implement the CMP

- The City of Ottawa Legal Department will be preparing an Offsite Contaminant Management Agreement

- Once the City of Ottawa has provided written acknowledgement of the CMP proposal to be implemented at this location, the acknowledgement letter will be forwarded to the TSSA

CLOSURE

We trust this CMP meets your current needs. The TSSA will be notified if the results of any monitoring event indicate statistically significant degradation of environmental conditions.

The TSSA will also be notified in writing, prior to implementation, if any changes are proposed to this CMP.

If you require further information pertaining to the investigations undertaken by **exp**, please do not hesitate to contact the undersigned.

Sincerely,
exp Energy Services Ltd.

Limitation of Liability, Scope of Report and Third Party Reliance

LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by **exp** Energy Services Ltd. (**exp**) for Imperial Oil Limited. It is intended for the sole and exclusive use of Imperial Oil Limited, its affiliated companies and partners and the respective insurers, agents, employees and advisors (collectively, "Imperial"). Any use, reliance on or decision made by any person other than Imperial based on this report is the sole responsibility of such other person. Imperial and **exp** make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties, or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by **exp** with respect to this report and any conclusions or recommendations made in this report reflect **exp's** judgment based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which the samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial, copying or distribution of this report or the use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of **exp.** Nothing in this report is intended to constitute or provide a legal opinion.

II"1", and the Access to Information Act (Canada) 1980-81-82-83, c.111, Sch. I "1", as such legislation may be amended from time to time."

Summary Sheet

1. Site and Adjacent Land Conditions

Land Use	Public Right-of-Way
Date of Soil Sampling	September 17, 2014
Date of Ground Water Sampling	October 6, 2014
Number of Test Holes Drilled	3 (TH100 to TH102)
Number of Monitoring Wells Installed	3 (TH100 to TH102)
Type of OVM Meter	Gastechtor 1238 ME
Adjacent Land Use (current)	North – Commercial East – Community (High School) South – Residential West – Operating Gas Station and Car Wash (Imperial Oil site)
Aquifer Usage in 250 metre Radius	No

2. Site Soil Conditions

Soil Type	Maximum Depths (mbgs)	Comments
Asphalt	0.3	
Sand and Gravel	2.1	Fill material
Limestone	5.0	Bedrock encountered at 2 mbgs

3. Ground Water

Depth (mbgs)	Approximately 3
Inferred Ground Water Flow Direction	Southwesterly
Liquid Petroleum Detected	No

4. Selected Soil and Ground Water Standards

Regulation 153/04, as amended, Table 3 (industrial/commercial/community property use and medium and fine textured soils in a non-potable ground water condition)

5. Analytical Results (Samples exceeding applicable Regulation 153/04 standards)

Location	Medium	Depth (mbgs)	Parameters
TH9	Water	n/a	PHC F1 to F3
TH101/DUP1	Water	n/a	PHC F1 and F2
TH102	Water	n/a	PHC F2

1 Introduction

Exp Energy Services Ltd. (**exp**) was retained by Imperial Oil to conduct a supplemental Phase II environmental site assessment (ESA) in the public right-of-way along Merivale Road and Viewmount Drive, adjacent to the Imperial Oil site located at 1660 Merivale Road, Ottawa, Ontario. This area of Merivale Road and Viewmount Drive will henceforth be referred to as the subject property. A locality plan is provided as Figure 1.

The objective of the supplemental Phase II ESA was to gain an understanding of subsurface conditions at the subject property. The Phase II ESA involved a soil and ground water sampling program. Parameters chosen for analysis during the investigation were based upon the use of the adjacent Imperial Oil site as an operating gas station.

The environmental assessment standards for the subject property were determined using Ontario Regulation 153/04, as amended (Regulation 153/04), under Part XV.1 of the *Environmental Protection Act*. Soil and ground water samples were collected, preserved, and submitted to the Mississauga facility of Maxxam Analytics (Maxxam), a Standards Council of Canada (SCC) accredited laboratory.

Exp performed the environmental site assessment work in accordance with generally accepted professional practices. Subject to this standard of care, **exp** makes no express or implied warranties regarding its services and no third party beneficiaries are intended. Limitation of liability, scope of report and third party reliance are outlined in Appendix A.

2 Site Background

2.1 Site Description

The subject property is located north and east of the Imperial Oil property in the public right of way on Merivale Road and Viewmount Drive, in Ottawa, Ontario. A locality plan is provided as Figure 1 and a site plan is provided as Figure 2.

Surrounding properties are used primarily for residential, commercial, and institutional purposes. Directly north of Viewmount Drive is a large shopping centre. Directly east of Merivale Road is a high school. Residential dwellings are located south and a gas station and car wash are located directly southwest of the subject property.

2.2 Native Soils and Topography

The subject property is located in the physiographic region known as the Russell and Prescott Sand Plains. The surface soils are composed of sand and sandy loams

(*Physiography of Southern Ontario*, Chapman and Putnam, 1984). Based on field observation during this investigation, the water table is located in the limestone bedrock. Merivale Road slopes slightly downwards towards the southeast and Viewmount Drive slopes slightly downward toward the southwest.

The hydraulic conductivity of the limestone at the Imperial Oil site was measured to be 2.74 x 10^{-6} cm/s. Based on the grain size analysis performed during a previous investigation on the adjacent Imperial Oil site, the soil at the subject property has been classified as a medium and fine grained.

2.3 Ground Water and Municipal Services

The subject and surrounding properties are serviced with municipal water, storm sewers and sanitary sewers by the City of Ottawa. According to the City of Ottawa, its municipal water supply comes from the Ottawa River.

The nearest surface water body is Nepean Creek (a tributary of the Rideau River), located approximately 360 metres southeast of the subject property. Table 1 summarizes the environmental setting and site characteristics.

3 Assessment Standards

Ontario Regulation 153/04, as amended, under Part XV.1 of the *Environmental Protection Act* provides generic remediation standards based on land use (agricultural, residential/ parkland/institutional, or industrial/commercial/community), ground water use (potable or non-potable), soil type (coarse or medium and fine textured), and restoration depth (full or stratified).

Regulation 153/04 also provides alternate methods for assessment and remediation based on either restoring soil and/or ground water to background conditions or the use of a risk assessment. Generic standards for both soil and ground water are outlined in a document entitled *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act*, April 15, 2011.

According to Regulation 153/04, a property is considered to be an environmentally sensitive area if one or more of the following applies:

a) The property is
   i) within an area of natural significance,
   ii) includes or is adjacent to an area of natural significance or part of such an area, or,
   iii) includes land that is within 30 metres of an area of natural significance or part of such an area.

b) The soil at the property has a pH value as follows:
   i) for surface soil, less than 5 or greater than 9
   ii) for sub-surface soil, less than 5 or greater than 11

c) A qualified person is of the opinion that, given the characteristics of the property and the certification the qualified person would be required to make in a record of site condition in relation to the property as specified in Schedule A, it is appropriate to deem the property environmentally sensitive.

An "area of natural significance" means any of the following:

1. An area reserved or set apart as a provincial park or conservation reserve under the *Provincial Parks and Conservation Reserves Act, 2006*
2. An area of natural and scientific interest (life science or earth science) identified by the Ministry of Natural Resources as having provincial significance
3. A wetland identified by the Ministry of Natural Resources as having provincial significance
4. An area designated by a municipality in its official plan as environmentally significant, however expressed, including designations of areas as environmentally sensitive, as being of environmental concern and as being ecologically significant
5. An area designated as an escarpment natural area or an escarpment protection area by the Niagara Escarpment Plan under the *Niagara Escarpment Planning and Development Act*
6. An area identified by the Ministry of Natural Resources as significant habitat of a threatened or endangered species
7. An area which is habitat of a species that is classified under section 7 of the *Endangered Species Act, 2007* as a threatened or endangered species
8. Property within an area designated as a natural core area or natural linkage area within the area to which the Oak Ridges Moraine Conservation Plan under the *Oak Ridges Moraine Conservation Act, 2001* applies
9. An area set apart as a wilderness area under the *Wilderness Areas Act*

The subject property would not be considered environmentally sensitive as none of the conditions above apply, and based on our knowledge of the subject property the pH of soil of the Imperial Oil site where previous assessment work has been completed; the pH of the soil is likely to be within the applicable ranges for surface and subsurface soils.

In addition, the site condition standards for a shallow soil property or a surface water body in or near the property are not applicable to the subject property. At least 2/3 of the area of the subject property has soil to depths greater than 2 metres. It does not include all or part of a

water body, nor is it adjacent to a water body, nor does it include land within 30 metres of a water body.

Based on the land use of the subject property as discussed in Section 2.1, the soil texture as discussed in Section 2.2, as well as the environmental setting data shown in Table 1, the subject property would be classified as having industrial/commercial/ community property use in a non-potable ground water condition. Regulation 153/04 Table 3 standards for industrial/commercial/community property use and medium and fine textured soils are appropriate for evaluating conditions at the subject property.

4 Site Investigation

The objective of the site investigation was to evaluate subsurface conditions at the subject property. The investigation included the following activities:

- Inspecting soil conditions by drilling three test holes across the subject property and installing ground water monitors in all of the test holes
- Field screening of all recovered soil samples for the presence of environmental impact (i.e. soil headspace petroleum vapour measurements, physical observations)
- Submitting selected soil samples for laboratory analysis of the potential contaminants of concern (PCOC) based upon the use of the adjacent Imperial Oil site as an operating gas station
- Monitoring ground water levels in one existing monitor and three newly installed monitors to determine ground water elevations and ground water flow direction
- Submitting ground water samples from one existing monitor and three newly installed monitors for laboratory analysis of the PCOC based upon the use of the adjacent property as an operating gas station
- Conducting soil and ground water sampling in accordance with the Ministry of the Environment (MOE) *Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario*, dated December 1996, in accordance with the MOE *Protocol for Analytical Methods used in the Assessment of Properties* under *Part XV.1 of the Environmental Protection Act*, March 2004, as amended, and per **exp** Standard Operating Procedures (SOP), and generally accepted professional practices
- Determining the appropriate Site Condition Standards in accordance with Regulation 153/04

- Comparing the results of the soil and ground water analyses to the applicable Standards

All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

4.1 Potential Contaminants of Concern

The PCOC for this assessment were benzene, toluene, ethylbenzene, xylenes (BTEX), hexane, methyl t-butyl ether (MTBE), petroleum hydrocarbon (PHC) fractions F1 to F4, and lead. The PCOC were chosen based upon the use of the adjacent property as an operating gas station

4.2 Drilling Investigation

The drilling investigation was conducted from September 16 to 19, 2014. George Downing Estate Drilling Ltd. was contracted by **exp** to drill three test holes (TH100 to TH102). The test holes were drilled to a maximum depth of 5 metres below ground surface (mbgs) using a CME 75 track-mounted hollow stem auger. The test holes were daylighted to a maximum depth of 2 mbgs (depth to bedrock) using a hydrovacuum truck. Daylighting activities were performed to reduce the possibility that an unknown subsurface structure would be struck as drilling activities progressed. **Exp** retained Scotts Environmental Group Ltd. to provide the daylighting services. Bedrock cores from daylighting were disposed of at the Scotts Environmental Group Ltd. facility at 633 & 650 Fortune Crescent in Kingston, a MOE approved waste receiver.

Soil samples were collected as the drilling progressed at 0.5 metre intervals using a hand auger in the daylighted portion of the test holes. These samples were examined for geologic information and for physical evidence of chemical impact. No samples were collected below the daylighted portion as it was bedrock.

Soil samples were submitted to the laboratory from the "worst case" depth. Soil samples were not collected from "clean bottom" as bedrock was encountered at approximately 2 mbgs, which is above the water table depth. Contaminant indicators such as physical observations and measured soil headspace vapour concentrations were used to direct sampling of "worst case" samples.

After each sample collection, the hand auger was thoroughly cleaned with phosphate-free soap and tap water and rinsed with distilled water, then methanol, to prevent cross-contamination of subsequent soil samples. Hollow stem auger flights were cleaned with a brush between test hole locations. Following the conclusion of the drilling investigation, the drill rig was steam cleaned to decontaminate the equipment.

During the drilling investigation the following ground conditions were generally encountered:

0.0 to 0.3 mbgs	Asphalt
0.3 to 2.1 mbgs	Brown SAND and GRAVEL (Fill Material)
2.1 to 5.0 mbgs	Grey fractured LIMESTONE

Readings of petroleum vapour concentrations in the soil samples collected were recorded using a Gastechtor 1238 ME. This instrument is designed to detect and measure concentrations of combustible gas in the atmosphere. It is equipped with two ranges of measurement, reading concentrations in parts per million by volume (ppmv) or in percentage lower explosive limit (%LEL). The Gastechtor 1238 ME instrument can determine combustible vapour concentrations in the range equivalent to 0 to 11,000 ppmv of hexane. The instrument was configured to eliminate any response from methane for all sampling conducted at the subject property.

Instrument calibration is checked on a daily basis in both the ppmv range and %LEL range using standard gases comprised of known concentrations of hexane (400 ppmv, 40% LEL) in air. If the instrument readings are within ±10% of the standard gas value, then the instrument is deemed to be calibrated, however if the readings are greater than ±10% of the standard gas value then the instrument is re-calibrated prior to use.

Soil samples are collected from the hand auger using a stainless-steel spoon and placed into plastic bags. The samples are left to equilibrate within the bag at a temperature above 15° C for 30 minutes before measurement of the peak headspace concentration is taken. Petroleum vapours ranged from non-detectable to 100% LEL in samples where there was sufficient recovery to perform vapour measurements.

The test hole logs are provided in Appendix C along with the MOE well record.

All test holes were completed as subsurface monitors. The monitors were constructed of 50 millimetre diameter threaded polyvinylchloride (PVC) pipe. The lower section of pipe was slotted (0.254 millimetre slot) above and below the water table, as observed during drilling. The upper section of the pipe is a solid riser. The lower part of the annulus of the hole was backfilled with clean sand (fine graded silica sand with a uniformity coefficient of 1.1 to 1.7 and an effective size of 1.5 to 3.0 mm, usually K&E Well Pack #3 Silica Sand) up to approximately 0.3 metres above the top of the slotted section. A bentonite seal (dry chipped sodium montmorillonite in 9.52 mm diameter chips) was placed above the sand to just below grade. Concrete was used to seal the monitor at grade. The monitors were equipped with protective casings and locking lids. A diagram showing a typical monitor installation is provided in Appendix C.

Following the conclusion of the drilling investigation and installation of the monitors, all new monitors were developed by purging a minimum of three well volumes of water.

4.3 Soil Chemical Analysis

Four soil samples, including one field duplicate sample, were collected during this investigation and submitted to Maxxam for analysis of BTEX, hexane, MTBE, PHC fractions F1 to F4, and lead. All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

The results of the soil chemical analysis for petroleum related parameters are provided in Table 2 and Figure 3, along with the applicable Regulation 153/04 Table 3 standards. All soil samples were within the applicable Table 3 standards for all parameters analysed.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

4.4 Coring Water Chemical Analysis

A sample of the coring water used during the drill work was submitted to Maxxam for analysis of BTEX, hexane, MTBE, PHC fractions F1 to F4, and lead.

The results of the coring water chemical analysis are provided in Table 3, along with the applicable Ontario Regulation 153/04 Table 3 standards. The sample was within the applicable Table 3 standards for all parameters analysed.

A copy of the laboratory Certificates of Analysis is provided in Appendix D.

4.5 Ground Water Monitoring

One existing monitor (TH9) and the newly installed monitors were inspected for general physical condition, ground water depth, the presence of liquid petroleum and petroleum vapour concentrations on October 6, 2014.

All measurements of ground water and phase-separated liquid petroleum depth are made with a Solinst Model 122 oil/water interface probe. Both the probe and the measuring tape that come into contact with liquids within a monitor are cleaned with phosphate-free soap and water, rinsed with distilled water and then methanol after each measurement.

For all monitors in which phase-separated liquid petroleum is detected with the interface probe, the presence of liquid petroleum is verified with a bailer. For all monitors in which phase-separated liquid petroleum is not detected with the interface probe but that have a petroleum vapour reading of 5% LEL or higher, a bailer is used to check the monitor for the presence of phase-separated liquid petroleum. If there is measurable or observable phase-separated liquid petroleum in the bailer, then a ground water sample is not submitted for laboratory analysis from this location.

Following calibration of the Gastector 1238 ME, as described in Section 4.2, the ground water vapour concentrations were measured by placing the nozzle inside the monitoring well casing no less than six inches and no more than twelve inches below the top of pipe, immediately after the water well cap is removed. The peak reading is recorded.

Petroleum vapours ranged from 200 ppmv to 100% LEL. Liquid petroleum was not detected in any of the monitors. The depth to the ground water table ranged from 3.02 mbgs (TH101) to 3.60 mbgs (TH100).

Based on the ground water depths measured during the October monitoring event and ground water elevation data shown in Table 4, ground water contours were plotted, as shown on Figure 4. The benchmark used for the monitor survey was the north side of a manhole cover located approximately 5 metres west of the kiosk at 1660 Merivale Road, Ottawa, Ontario, with an assigned elevation of 100.00 metres. Based on the data, the ground water flow direction is interpreted to be southwesterly.

The horizontal gradient was calculated based on the ground water contour plan provided in Figure 4. The hydraulic gradient is approximately 0.022 m/m (change in hydraulic head per unit distance) towards the southwest.

Table 5 shows the Darcy's Law calculation of the estimated ground water flow velocity at the subject property. Based on the literature for the hydraulic conductivity of bedrock (Freeze and Cherry, 1979) and the hydraulic gradient determined during the current investigation, the ground water flow velocity was estimated to be approximately 10 centimetres per year.

4.6 Ground Water Chemical Analysis

On October 6, 2014, ground water samples were collected from TH9 and TH100 to TH102. All ground water samples were collected using a low-flow sampling technique. This technique involves pumping ground water at low rates, typically less than 500 mL per minute, to minimize drawdown.

Prior to collecting the ground water samples, the monitors were purged with the low flow sampling equipment and field parameters (pH, conductivity, turbidity, dissolved oxygen, temperature and oxidation reduction potential) were monitored until stable readings were achieved. These parameters are considered to be stable when three consecutive readings are within 10% of one another. When stabilization occurs, equilibrium between ground water within a monitor and the surrounding formation water is attained. As such, samples collected when stabilization occurs are considered to be representative of formation water. Five ground water samples, including one field duplicate sample, were collected and submitted to the Mississauga facility of Maxxam for chemical analysis of BTEX, hexane, MTBE, PHC fractions F1 to F4, and lead.

All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

The results of the ground water chemical analysis for petroleum related parameters are provided in Table 6 and Figure 5, along with the applicable Regulation 153/04 Table 3 standards. All ground water samples exceeded the applicable Table 3 standards except for the sample from TH100.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

5 Quality Management, Control and Assurance

The quality assurance and quality control measures are discussed in the Quality Management, Control and Assurance procedures outlined in Appendix B.

No field or laboratory QA/QC issues were identified that would affect the overall conclusions presented in this report. Overall, the results reported are considered to be reliable.

6 Current Site Status

During the drilling investigation, soil and ground water quality at the subject property were assessed. The results of soil and ground water sampling were compared to the Regulation 153/04 Table 3 standards for industrial/commercial/community property use and medium and fine textured soils. Soil and ground water samples were analysed for BTEX, hexane, MTBE, PHC fractions F1 to F4, and lead.

All soil samples were within the Table 3 standards for all parameters analysed. All ground water samples exceeded the Table 3 standards except the sample from TH100.

We trust this report meets your current needs. If you require further information pertaining to this investigation, please do not hesitate to contact the undersigned.

Sincerely,
exp Energy Services Ltd.

Analysis by Maxxam Analytics

All results in ppb (ug/L); mbgs means "metres below ground surface"; <RDL means not detected at reporting detection limit (RDL); na means "not analysed"

RDL are shown for non-detected results; for RDL of reportable results, see the respective laboratory certificate of analysis (refer to Maxxam Job #)

* Standards shown are for all types of property use and medium and fine textured soils in a non-potable ground water condition

Exceedances of Table 3 standards are shown in **bold**

Appendix A –
Limitation of Liability, Scope of Report and Third Party Reliance

LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by **exp** Energy Services Ltd. (**exp**) for Imperial Oil. It is intended for the sole and exclusive use of Imperial Oil, its affiliated companies and partners and the respective insurers, agents, employees and advisors (collectively, "Imperial Oil"). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and **exp** make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties, or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by **exp** with respect to this report and any conclusions or recommendations made in this report reflect **exp's** judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which the samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or the use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of **exp.** Nothing in this report is intended to constitute or provide a legal opinion.

exp.

Appendix B –
Quality Management, Control and Assurance

QUALITY MANAGEMENT, CONTROL AND ASSURANCE

Project Quality Management

The field work documented in this report and the preparation of this report were overseen by a Qualified Person, as defined in Ontario Regulation 153/04, as amended (Regulation 153/04).

Sampling analysis was performed using generally accepted principles and with appropriate sampling equipment. Written field and laboratory sampling procedures for soil and ground water developed by **exp** Energy Services Ltd. (**exp**) were used to ensure consistency in sample collection and preparation of samples for submission to the laboratory.

The staff involved in the field sampling have participated in regular, ongoing training programs and were qualified and experienced in collecting, describing, and preparing environmental samples for laboratory analysis.

Laboratory analysis was performed using generally accepted principles in accordance with the *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the* Environmental Protection Act, March 9, 2004 amended as of July 1, 2011 (Protocol).

Data quality objectives for the parameters of concern were set to meet acceptable RDLs to achieve the goal of defining areas where such parameters are present at levels in excess of applicable generic standards, as defined in Regulation 153/04. Sampling programs included providing written instruction to the analytical laboratory describing the required analyses on the Chain of Custody prepared and delivered with the samples.

The laboratory has a standing contract with Imperial Oil which sets out specific data quality requirements. Any non-compliance with this contract is documented using a data quality waiver issued by the laboratory. When a data quality waiver is issued by the laboratory, it must be reviewed, signed by **exp**, and returned to the laboratory. Data quality waivers are included with all reports, along with the complete Certificate of Analysis.

Field Quality Assurance/ Quality Control

The soil and ground water sampling plan was prepared and executed based on previous assessment work on the subject property, and on professional judgment at the time of the investigation.

Field observations were made and documented in a field book in accordance with generally accepted practices and with the procedures developed and utilized by **exp**.

Exp field sampling Quality Assurance and Quality Control (QA/QC) protocols are tailored to the investigation and include:

- The collection of at least one field duplicate sample for both soil and ground water for every ten samples or less (where three or more such samples are collected)

- For soil samples analysed for volatile organic compounds, including BTEX, the collection of discrete samples directly into vials containing methanol

- For soil samples analysed for all other parameters, the collection of discrete samples directly into jars

- For ground water samples, the collection of samples directly into vials or bottles with Teflon-lined lids containing an appropriate preservative, where required

- For ground water samples analysed for dissolved metals, including mercury and hexavalent chromium, filtration of the sample in the field using a 45 micron disposable filter prior to collection in a bottle containing preservative

- For ground water samples analysed for benzo(a)pyrene, where deemed necessary by the Qualified Person overseeing this work, the collection of an additional bottle for laboratory filtration prior to analysis

- The immediate placement, upon collection, of both soil and ground water samples into a cooler with free ice to lower the temperature to less than 10^{o} C

- For soil sampling, the thorough cleaning of soil sampling equipment using soap and water, followed by a distilled water rinse and a methanol rinse between sample locations

- For ground water sampling, the use of dedicated sampling equipment at different monitors (including the use of dedicated tubing when low flow ground water sampling techniques are used)

- Ensuring that neither the bare hand nor latex glove comes into contact with the soil or ground water as it is being placed into the sample container

- The inclusion of one soil trip blank, at a frequency determined by the Qualified Person, when samples are being analysed for volatile organic compounds, including BTEX. The methanol-charged vials containing the trip blank are prepared by the laboratory: placed in a cooler with ice no later than the morning of the day of sampling (trip blank vials are not placed on ice by the laboratory); and returned to the laboratory unopened for analysis as part of the submission

- The inclusion of one soil field blank for PAH analysis at a frequency determined by the Qualified Person. The field blanks are prepared in the field with laboratory-

supplied silica during the sample collection process and returned to the laboratory for analysis as part of the submission

- The inclusion of one ground water field blank and trip blank per submission for all parameters in ground water except pH and electrical conductivity. The field blanks are prepared in the field during the sample collection process using laboratory-supplied water and returned to the laboratory for analysis as part of the submission. The trip blanks are prepared by the laboratory, kept in the cooler on ice for the duration of the sampling event and returned to the laboratory unopened for analysis as part of the submission

- All samples were shipped to the laboratory in custody sealed coolers, filled with ice at less than 10^{o} C

- All sample shipments are accompanied by standard chain of custody forms

- For each analysis and matrix, Table B-1 describes the type of sample container and preservation technique used

The results of the field duplicate samples are presented along with the tabulated data in this appendix. Tabulated data are presented to a maximum of two significant digits.

Laboratory Quality Assurance/Quality Control

All laboratory analyses were completed by the Mississauga facility of Maxxam Analytics (Maxxam). This Maxxam laboratory has been accredited by the Standards Council of Canada (SCC) for all of the parameters that were analysed in accordance with the latest version of the International Standard ISO/IEC 17025 – "*General Requirement for the Competence of Testing and Calibration Laboratories*". Maxxam performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the Protocol.

Exp has accepted the data provided by Maxxam based on the assurance from Maxxam that, as a minimum, the following requirements have been met and documentation to demonstrate compliance can be produced on request:

- The method performance criteria identified in the Protocol were met

- Sample storage requirements, pre-analysis processing techniques, and holding times for all sample types as identified in the Protocol were met following receipt and sign-off of the samples from **exp** staff

- The results of all laboratory QC samples were within statistically determined control limits and if not, reasons were provided

- Surrogate recoveries for organic analyses were monitored and recorded

- Details on the precision and accuracy of the data have been recorded and retained and are available from the laboratory should they be required as a result of a Ministry of the Environment (MOE) audit

- The analytical data were reported without blank correction (unless the correction was clearly identified on the Certificate of Analysis)

- All soil sampling results were reported on a dry weight basis

- All laboratory QA/QC sample data, including method blanks, matrix spikes, matrix duplicates, laboratory control samples, and surrogate recoveries, were included in the Certificate of Analysis

All Certificates of Analysis were reviewed by the Qualified Person to ensure that data quality objectives have been met and that any anomalies have been identified. A data quality review checklist has been prepared by an **exp** staff member under the supervision of the Qualified Person for each laboratory submission. The checklist is appended with each Certificate of Analysis. All Certificates of Analysis meet the requirements under Section 47(3) of Regulation 153/04.

Quality Assurance/Quality Control Program

A summary of laboratory data quality waivers and other laboratory and field data quality issues is provided in Table B-2. No issues were identified that would have a material effect on the interpretation of results presented in this report.

The laboratory QA/QC program consisted of one or more of the following analysis: a) instrument and extraction surrogate recoveries for soil and/or ground water samples that were analysed and b) the analysis of a method blank, laboratory duplicate, matrix spike and/or laboratory control samples for the analytical batches that were analysed. The laboratory QA/QC results are included in the certificates of analysis. As indicated, no laboratory QA/QC issues were identified that would have a material effect on the interpretation of results presented in this report.

The soil field QA/QC program consisted of the following submission for laboratory analysis: one field duplicate and trip blank for BTEX, hexane, MTBE, and petroleum hydrocarbon (PHC) fractions F1.

The ground water field QA/QC program consisted of the following submission for laboratory analysis: one field duplicate, field blank, and trip blank sample were analyzed for BTEX, hexane, MTBE, PHC fractions F1 to F4, and lead.

For the field duplicate samples, evaluation of the QA/QC results were determined by calculating the relative percent difference (RPD) between the field duplicate and original sample results, and comparison of the RPD to designated alert limits. Consistent with laboratory practices and to permit reliable calculations, an RPD is only calculated when the original and duplicate sample concentrations are at least five times the reportable detections limits.

$$RPD = \left| \frac{(x_1 - x_2)}{\left(\frac{(x_1 + x_2)}{2}\right)} \right| \times 100\%$$

The RPD for the soil field duplicate samples are provided in Tables B-3, along with the designated field duplicate alert limits. All of the RPD were not calculable.

The soil trip blank data was compared to the alert limits and are provided in Tables B-4. All of the results were within the alert limits.

The RPD for the ground water field duplicate sample are provided in Table B-5, along with the designated field duplicate alert limits. All of the RPD were either within the alert limits or not calculable.

The ground water trip blank and field blank data were compared to the alert limits and are provided in Table B-6. All of the results were within the alert limits.

No field or laboratory QA/QC issues were identified that would affect the overall conclusions presented in this report. Overall, the results reported are considered to be reliable.

Table B-1

SAMPLE CONTAINERS AND PRESERVATIVES

Adjacent to 1660 Merivale Road, Ottawa, Ontario

Parameter Group	Matrix	Container	Preservative
BTEX/F1	Soil	2 x 40 mL C/G TL septum cap vial	Less than 10°C Methanol
VOC	Soil	2 x 40 mL C/G TL septum cap vial	Less than 10°C Methanol
F2-F4	Soil	60 or 120 mL C/G TL	Less than 10°C
Lead	Soil	120 or 250 mL C/G	Less than 10°C
BTEX/F1	Ground Water	4 x 40 mL C/G TL septum cap vial	Less than 10°C 18% $NaHSO_4$
VOC	Ground Water	4 x 40 mL C/G TL septum cap vial	Less than 10°C 18% $NaHSO_4$
F2-F4	Ground Water	2 x 500mL A/G TL	Less than 10°C 15% $NaHSO_4$
Lead	Ground Water	120 mL HDPE	Less than 10°C 18% HNO_3

A/G means "amber glass"; C/G means "clear glass"; HDPE means "High Density Polyethylene"; TL means "Teflon-lined lid"

Table B-2

DATA QUALITY WAIVERS AND OTHER DATA ISSUES

Adjacent to 1660 Merivale Road, Ottawa, Ontario

Maxxam Job #	DQW #	Matrix	Sample ID	Test Affected	Deviation	Interpretation
B4H2890	N/A	Water	W1	PHC F1	d10-ethylbenzene instrument surrogate recovery (4.7%) is below the acceptance criteria (60-140%)	Possible low bias in reported F1 result for this sample. Since the F1 result was below the detection limit and the detection limit is well below the Table 3 standard, the possible low bias in surrogate recovery should have no material effect on the interpretation of the data
	2128	Water	W1	BTEX/PHC F1	Matrix spike for toluene (6.5%), ethylbenzene (12%), o-xylene (0.82%), and p+m-xylene (1.3%) are below acceptance criteria (50-140%)	Possible low bias in reported toluene, ethylbenzene, and xylenes result for this sample. Since toluene, ethylbenzene, and xylenes results for this sample were below the detection limits and the detection limits are well below the Table 3 standards, the possible low bias in matrix spike recovery should have no material effect on the interpretation of the data
B4I8260	N/A	Water	Batch 3783712	Metals	Trend rule failure for selenium and beryllium: EWMA greater than 1.5 standard deviation below the mean	Possible low bias of selenium and beryllium results. Since analyses of selenium and beryllium were not requested as part of this submission and these parameters are not contaminants of concern at the subject property, the possible low bias should have no material effect on the interpretation of the results for this batch
B4I8266	N/A	Water	Batch 3783712	Metals	Trend rule failure for selenium and beryllium: EWMA greater than 1.5 standard deviation below the mean	Possible low bias of selenium and beryllium results. Since selenium and beryllium were not requested as part of this submission and these parameters are not contaminants of concern at the subject property, the possible low bias should have no material effect on the interpretation of the results for this batch

CONVENTIONS USED IN PARAMETER ANALYSIS

ABBREVIATIONS	PARAMETERS INCLUDED
F1-F4	Petroleum Hydrocarbon Fractions F1 to F4
BTEX	Benzene, Toluene, Ethylbenzene, Xylenes
BTEXH	Benzene, Toluene, Ethylbenzene, Xylenes, Hexane
VOC	Full Suite of Volatile Organic Compounds
CVOC	Chlorinated Volatile Organic Compounds (1,1-Dichloroethane, 1,2-Dichloroethane, 1,1-Dichloroethylene, cis-1,2-Dichloroethylene, trans-1,2-Dichloroethylene, Ethylene Dibromide, Methyl t-Butyl Ether, Tetrachloroethylene, 1,1,1-Trichloroethane, 1,1,2-Trichloroethane, Trichloroethylene, Vinyl Chloride)
CFC	Chlorofluorocarbons (Dichlorodifluoromethane (FREON 12), Trichlorofluoromethane (FREON 11))
1,2-DCA, EDB, MTBE	1,2-Dichloroethane, Ethylene Dibromide, Methyl t-Butyl Ether only
Selected VOC	Any variation of Volatile Organic Parameters not listed above
SVOC	Semivolatile Organic Compounds (Includes PAH, CP, ABN)
PAH	Full Suite of Polycyclic Aromatic Hydrocarbons
2 & 3 Ring PAH	2- & 3- Ring Polycyclic Aromatic Hydrocarbons (Acenaphthene, Acenaphthylene, Anthracene, Fluoranthane, Fluorene, 1-Methylnaphthalene, 2-Methylnaphthalene, Total Methylnaphthalene, Naphthalene, Phenanthrene)
Selected PAH	Any variation of Polycyclic Aromatic Hydrocarbons not listed above
CP	Chlorophenols
ABN	Acid-Base Neutral Compounds
Inorganics	Full Suite of Inorganics (may or may not include Chromium (VI), Hot Water Soluble Boron, Mercury and/or any other Inorganic parameter)
Pb	Lead only
Selected Inorganics	Any variation of Inorganic parameters not listed above
pH	Hydrogen Ion Concentration
OCP	Organochlorine Pesticides
PCB	Total Polychlorinated Biphenyls (includes Aroclor 1242, 1248, 1252, 1262)
1,4 - Dioxane	1,4 - Dioxane
D/F	Dioxins/Furans
SAR	Sodium Adsorption Ratio
EC	Conductivity
FOC	Fraction of Organic Carbon

Ontario Ministry of the Environment

Well Record for Well Cluster - Part 2 of 3
Land Owner Consent

This form is to be completed by the person who constructs or abandons test holes or dewatering wells that form all or part of a well cluster. If this form is being used to report any well abandonment, these wells must have been previously reported as part of a single well cluster.

Note: For well cluster records, only the owners of the land on which the wells are situated are to give written consent. If the well purchaser (e.g. a consultant who hires the driller) is not the owner of the land, then the well purchaser cannot sign the consent form.

By signing this form, land owners are providing consent to use one well record to report a well cluster of test holes or dewatering wells in accordance with section 16.4 of Regulation 903 made under the *Ontario Water Resources Act*.

This completed **Well Record for Well Cluster Part 2 - Land Owner Consent** must be attached to Parts 1 and 3.

* Please PRINT if completing by hand.

Ontario Ministry of the Environment

Well Record for Well Cluster - Part 3 of 3
Detailed Drawing of All Well Locations

Note: This **Well Record for Well Cluster Part 3 - Detailed Drawing of all Well Locations,** must be attached to Parts 1 and 2. The drawing must include all property boundaries, an arrow indicating the North direction, all named roads and sufficient measurements to locate all wells in the cluster in relation to fixed points. The drawing must show the location of each well and each well must be numbered on the drawing to match number used for that well on the **Well Record for Well Cluster Parts 1 and 2.** The well with the well tag must be clearly identified on the Drawing.
UTM coordinates should appear beside each well, if space permits. Additional comments on wells can be included on the drawing.

Well Tag Number: # A156973

Appendix D –
Laboratory Certificates of Analysis

Attached are copies of the original Certificates of Analysis provided by the laboratory. The data contained in these analyses is to be read only in conjunction with the report to which it is attached. For interpretation of the chemical data, see the attached text.

Since the laboratory data contains scientific terms and references, only trained persons familiar with sampling and laboratory methods should attempt to interpret the data contained in the Certificates of Analysis.

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	Units	QC Limits
			F1 (C6-C10)	2014/09/24		88	%	80 - 120

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd.

Sampling Date: September 17, 2014

Location: Adjacent to 1660 Merivale Road, Ottawa, Ontario

Laboratory : Maxxam Analytics

Consultant Project Number: 11010

Sample Submission Number: B4H2865

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B4H2879
Received: 2014/09/18, 15:20

Sample Matrix: Soil
Samples Received: 1

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Soil	1	CAM SOP-00315	CCME PHC-CWS m
Volatile Organic Compounds in Soil	1	CAM SOP-00226	EPA 8260 m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd. Sampling Date: September 17, 2014

Location: Adjacent to 1660 Merivale Road, Ottawa, Ontario Laboratory : Maxxam Analytics

Consultant Project Number: 11010 Sample Submission Number: B4H2879

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits
Trip Blank Concentration	X			
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B4H2890
Received: 2014/09/18, 15:20

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	1	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water	1	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	1	CAM SOP-00447	EPA 6020 m
Volatile Organic Compounds in Water	1	CAM SOP-00226	EPA 8260 m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

RDL = Reportable Detection Limit
QC Batch = Quality Control Batch
Lab-Dup = Laboratory Initiated Duplicate
(1) The surrogate recovery for the sample was below the acceptance criteria. The sample was reanalyzed with the same results. It was concluded that the sample matrix is reacting with the surrogate resulting in low recoveries.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) The surrogate recovery for the sample was below the acceptance criteria. The sample was reanalyzed with the same results. It was concluded that the sample matrix is reacting with the surrogate resulting in low recoveries.

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd. Sampling Date: September 17, 2014

Location: Adjacent to 1660 Merivale Road, Ottawa, Ontario Laboratory : Maxxam Analytics

Consultant Project Number: 11010 Sample Submission Number: B4H2890

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery		X		Instrument surrogate recoveries of d10-ethylbenzene in W1 (4.7%) is below the acceptance criteria (60-140%). Matrix spike recoveries for toluene (6.5%), ethylbenzene (12%), o-xylene (0.82%) and p+m-xylene (1.3%) in W1 were below acceptance criteria (50-140%). Matrix spike recovery for PHC F1 (61%) was flagged by the lab as it was below their QC limits (70-130%); however it is within the MOE acceptance criteria (60-140%). All other laboratory QC met acceptance criteria.
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery		X		
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were submitted
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Not Required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: Yes

Date Issued: 26-Sep-14 Date of Response: 26-Sep-14

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B4I8260
Received: 2014/10/08, 15:00

Sample Matrix: Water
Samples Received: 5

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	5	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water	5	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	5	CAM SOP-00447	EPA 6020 m
Volatile Organic Compounds in Water	5	CAM SOP 00228	EPA 8260 m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	6.3°C
Package 2	7.0°C
Package 3	5.3°C

SQC trend rule failure for Beryllium, Batch 3783712. EWMA greater than 1.5 SD below the mean.

SQC trend rule failure for Selenium, Batch 3783712. EWMA greater than 1.5 SD below the mean.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC Batch	Init	QC Type	Parameter	Date Analyzed	Value	Recovery	Units	QC Limits
			F4 (C34-C50 Hydrocarbons)	2014/10/16		96	%	60 - 130

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd.

Sampling Date: October 6, 2014

Location: Adjacent to 1660 Merivale Road, Ottawa, Ontario

Laboratory : Maxxam Analytics

Consultant Project Number: 11010

Sample Submission Number: B4I8260

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	No
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Not Required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

2014 Ground Water Monitoring and Sampling Program Report
Site Address: 1660 Merivale Road, Ottawa, Ontario
IOL Site Number: 302620
Project Number: 11010
Limitation of liability, scope of report and third party reliance: Appendix A

Sampling Event: August 2014

SCOPE OF WORK

- Monitor all accessible monitors (TH1 to TH7) for subsurface vapour concentrations, water levels and the presence or absence of phase-separated liquid petroleum
- Collect ground water samples from all accessible monitors and submit to the laboratory for analysis of benzene, toluene, ethylbenzene, and xylenes (BTEX), hexane, petroleum hydrocarbon fractions (PHC) F1 to F4, and lead
- Compare the ground water analytical results to the applicable Ontario Regulation 153/04 standards. For this site, Ontario Regulation 153/04 Table 3 standards for an industrial/commercial/community property use and medium and fine textured soils and non-potable ground water use were selected per the CMP prepared by **exp** Energy Services Ltd. on June 27, 2011

RESULTS

- *Ground Water Monitoring* (**Date** - Depth to Ground Water Range; Ground Water Direction)
  - **August 26, 2014** – 3.03 to 4.05 mbgs; southeasterly (Figure 1 and Table 1)
- *Monitoring Well Headspace Vapour* (**Date -** Range)
  - **August 26, 2014** - non-detectable to 30% LEL (Table 1)
- *Liquid Petroleum Occurrence* (**Date** - Observations)
  - **August 26, 2014** - no measurable liquid petroleum (Figure 2 and Table 1)
- *Ground Water Analytical Exceedances* (**Date** - Wells)
  - **August 26 & 27, 2014** - TH3, TH4/DUP1, TH5, and TH7 (Figure 2 and Table 2)

METHODOLOGY

Subsurface Vapour Concentrations

All measurements of petroleum vapours in the monitor riser were made with a Gastechtor 1238 ME in methane elimination mode. Immediately after removing the well cap, the collection tube of the Gastechtor was inserted into the riser and the peak instrument reading wa s recorded.

Combustible Gas Detector Calibrations

Gastechtor 1238 ME calibration is checked on a daily basis in the field in both the parts per million by volume (ppmv) and percentage lower explosive limit (% LEL) range using standard gases comprised of a known concentration of hexane (400 ppmv, 40% LEL) in air. If the instrument readings are within +/- 10% of the standard gas value, then the instrument is deemed to be calibrated. However, if the readings are greater than +/- 10% of the standard gas value then the instrument is re-calibrated in the field prior to use.

Depth to Ground Water and Free Product Thickness

All measurements of depth to ground water and presence or absence of phase-separated liquid petroleum are made with a Solinst Model 122 oil/water interface probe. Both the probe and the measuring tape that come into contact with liquids within a monitor are cleaned with phosphate-free soap and tap water, rinsed with distilled water and then finally rinsed with methanol after each measurement. For all monitors in which phase-separated liquid petroleum is detected with the interface probe, the presence of liquid petroleum is verified with a bailer. For all monitors in which phase-separated liquid petroleum is not detected with the interface probe but that have a petroleum vapour reading of 5% LEL or higher, a bailer is used to check the monitor for the presence of phase-separated liquid petroleum. If there is measurable or observable phase-separated liquid petroleum in the bailer, then a ground water sample is not submitted for laboratory analysis from this location.

Ground Water Sampling Methodology

Ground water samples were collected from all the accessible monitors on August 26 & 27, 2014. All ground water samples were collected using a low-flow sampling technique. This technique involves pumping ground water at low rates, typically less than 500 mL per minute, to minimize drawdown. Purge water collected from the monitors during sampling activities was disposed of at the Scott's Environmental Group facility in Kingston, Ontario, an MOE approved waste receiver.

Prior to collecting the ground water samples, the monitors were purged with the low flow sampling equipment and field parameters (pH, conductivity, turbidity, dissolved oxygen, temperature, and oxidation reduction potential) were monitored until stable readings were achieved. These parameters are considered to be stable when three consecutive readings are within 10% of one another. When stabilization occurs, equilibrium between ground water within a monitor and the surrounding formation water is attained. As such, samples collected when stabilization occurs are considered to be representative of formation water.

Laboratory Analysis of Samples

Samples were collected in the appropriate sample containers, using the appropriate preservatives. All sample bottles were supplied by the laboratory. The ground water samples were placed into a cooler with ice at less than 10°C immediately after they were collected. The samples were submitted to the Mississauga facility of Maxxam Analytics (Maxxam), a Standards Council of Canada (SCC) accredited laboratory. Analytical methods used are referenced in the certificates of analysis presented in Appendix B.

Quality Assurance and Quality Control Program

A quality assurance and quality control (QA/QC) program was implemented to reduce and quantify potential issues introduced during sample collection. All work was carried out following the quality management, control and assurance procedures outlined in Appendix C. A discussion of the laboratory and field QA/QC program is also

provided in Appendix C. In summary, no QA/QC issues were identified that would materially affect the overall conclusions of the ground water monitoring and sampling assessment described in this report.

CLOSURE

We trust this report meets your current needs. If you require further information pertaining to this investigation, please do not hesitate to contact the undersigned.

Sincerely,

exp Energy Services Ltd.

Note:

All measurements shown in metres (m)

Elevations are relative to local benchmark (centre of storm sewer catch basin located approximately 5 metres west of kiosk)

assigned elevation = 100.00 m (exp, 2013)

nd means "not detected"; nm means "not monitored"; na means "not accessible"; n/a means "not applicable"; mbgs means "metres below ground surface"

Vapour concentrations measured using Gastechtor 1238 ME operated in methane elimination mode

Petroleum vapour concentrations <500 ppmv shown in parts per million volume (ppmv), >500 ppmv shown in percent of lower explosive limit (% LEL)

* If liquid petroleum was measured, the water table elevations were corrected assuming a liquid petroleum specific gravity of 0.75

** Monitoring well installed in October 2011

Appendix A –
Limitation of Liability, Scope of Report and Third Party Reliance

LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by **exp** Energy Services Ltd. (**exp**) for Imperial Oil. It is intended for the sole and exclusive use of Imperial Oil, its affiliated companies and partners and the respective insurers, agents, employees and advisors (collectively, "Imperial Oil"). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and **exp** make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties, or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by **exp** with respect to this report and any conclusions or recommendations made in this report reflect **exp's** judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which the samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or the use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of **exp.** Nothing in this report is intended to constitute or provide a legal opinion.

Appendix B –
Laboratory Certificates of Analysis

Attached are copies of the original Certificates of Analysis provided by the laboratory. The data contained in these analyses is to be read only in conjunction with the report to which it is attached. For interpretation of the chemical data, see the attached text.

Since the laboratory data contains scientific terms and references, only trained persons familiar with sampling and laboratory methods should attempt to interpret the data contained in the Certificates of Analysis.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B4F7840
Received: 2014/08/28, 18:35

Sample Matrix: Water
Samples Received: 8

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	8	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water	8	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	8	CAM SOP-00447	EPA 6020 m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.0°C
Package 2	1.7°C
Package 3	1.7°C
Package 4	1.0°C

The following bottles contained visual sediment, which was included in the analysis as per the Protocol for Analytical Methods Use in the Assessment of Properties under part XV.1 of the Environmental Protection Act.
ment.

For sample TH1:
1 of 1 x 500mL amber glass bottle for F2-F4 contains 3.8cm of sediment.
1st of 4x 40mL clear glass vial for F1/BTEX contains 4.6cm of sediment.
2nd of 4 x 40mL clear glass vial for F1/BTEX contains 2.5cm of sediment.
3rd of 4 x 40mL clear glass vial for F1/BTEX contains 1.8cm of sediment.
4th of 4 x 40mL clear glass vial for F1/BTEX contains 5.6cm of sediment.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd.

Sampling Date: August 26 & 27, 2014

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics

Consultant Project Number: 11010

Sample Submission Number: B4F7840

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Not required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B4F7892
Received: 2014/08/28, 18:35

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Laboratory Method	Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	2	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water	2	CAM SOP-00316	CCME PHC-CWS m
Dissolved Metals by ICPMS	2	CAM SOP-00447	EPA 6020 m

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd.

Sampling Date: August 27, 2014

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics

Consultant Project Number: 11010

Sample Submission Number: B4F7892

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration	X			All field QC samples are within alert limits
Trip Blank Concentration	X			
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Not required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Quality Management, Control and Assurance

QUALITY MANAGEMENT, CONTROL AND ASSURANCE

Project Quality Management

The field work documented in this report and the preparation of this report were overseen by a Qualified Person, as defined in Ontario Regulation 153/04, as amended (Regulation 153/04).

Sampling analysis was performed using generally accepted principles and with appropriate sampling equipment. Written field and laboratory sampling procedures for ground water developed by **exp** Energy Services Ltd. (**exp**) were used to ensure consistency in sample collection and preparation of samples for submission to the laboratory.

The staff involved in the field sampling have participated in regular, ongoing training programs and were qualified and experienced in collecting, describing, and preparing environmental samples for laboratory analysis.

Laboratory analysis was performed using generally accepted principles in accordance with the *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the* Environmental Protection Act, March 9, 2004 amended as of July 1, 2011 (Protocol).

Data quality objectives for the parameters of concern were set to meet acceptable RDLs to achieve the goal of defining areas where such parameters are present at levels in excess of applicable generic standards, as defined in Regulation 153/04. Sampling programs included providing written instruction to the analytical laboratory describing the required analyses on the Chain of Custody prepared and delivered with the samples.

The laboratory has a standing contract with Imperial Oil which sets out specific data quality requirements. Any non-compliance with this contract is documented using a data quality waiver issued by the laboratory. When a data quality waiver is issued by the laboratory, it must be reviewed, signed by **exp**, and returned to the laboratory. Data quality waivers are included with all reports, along with the complete Certificate of Analysis.

Field Quality Assurance/ Quality Control

The ground water sampling plan was prepared and executed based on previous assessment work conducted for the site and on professional judgment at the time of the investigation.

Field observations were made and documented in a field book in accordance with generally accepted practices and with the procedures developed and utilized by **exp**.

Exp field sampling Quality Assurance and Quality Control (QA/QC) protocols are tailored to the investigation and include:

- The collection of at least one field duplicate sample for every ten samples or less (where three or more such samples are collected)
- For ground water samples, the collection of samples directly into vials with Teflon-lined lids or bottles containing an appropriate preservative, where required
- For ground water samples analysed for dissolved metals, including mercury and hexavalent chromium, filtration of the sample in the field using a 45 micron disposable filter prior to collection in a bottle containing preservative
- For ground water samples analysed for benzo(a)pyrene, where deemed necessary by the Qualified Person overseeing this work, the collection of an additional bottle for laboratory filtration prior to analysis
- The immediate placement, upon collection, of ground water samples into a cooler with free ice to lower the temperature to less than 10° C
- For ground water sampling, the use of dedicated sampling equipment at different monitors (including the use of dedicated tubing when low flow ground water sampling techniques are used)
- Ensuring that neither the bare hand nor latex glove comes into contact with the ground water as it is being placed into the sample container
- The inclusion of one ground water field blank and trip blank per submission for all parameters in ground water except pH and electrical conductivity. The field blanks are prepared in the field during the sample collection process using laboratory-supplied water and returned to the laboratory for analysis as part of the submission. The trip blanks are prepared by the laboratory, kept in the cooler on ice for the duration of the sampling event and returned to the laboratory unopened for analysis as part of the submission
- All samples were shipped to the laboratory in custody sealed coolers, filled with ice at less than 10° C
- All sample shipments are accompanied by standard chain of custody forms

The results of the field duplicate samples are presented along with the tabulated data in this appendix. Tabulated data are presented to a maximum of two significant digits.

Laboratory Quality Assurance/Quality Control

All laboratory analyses were completed by the Mississauga facility of Maxxam Analytics (Maxxam). This Maxxam laboratory has been accredited by the Standards Council of Canada (SCC) for all of the parameters that were analysed in accordance with the latest version of the International Standard ISO/IEC 17025 – "*General Requirement for the Competence of Testing and Calibration Laboratories*". Maxxam performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the Protocol.

Exp has accepted the data provided by Maxxam based on the assurance from Maxxam that, as a minimum, the following requirements have been met and documentation to demonstrate compliance can be produced on request:

- The method performance criteria identified in the Protocol were met
- Sample storage requirements, pre-analysis processing techniques, and holding times for all sample types as identified in the Protocol were met following receipt and sign-off of the samples from **exp** staff
- The results of all laboratory QC samples were within statistically determined control limits and if not, reasons were provided
- Surrogate recoveries for organic analyses were monitored and recorded
- Details on the precision and accuracy of the data have been recorded and retained and are available from the laboratory should they be required as a result of a Ministry of the Environment (MOE) audit
- The analytical data were reported without blank correction (unless the correction was clearly identified on the Certificate of Analysis)
- All laboratory QA/QC sample data, including method blanks, matrix spikes, matrix duplicates, laboratory control samples, and surrogate recoveries, were included in the Certificate of Analysis

All Certificates of Analysis were reviewed by the Qualified Person to ensure that data quality objectives have been met and that any anomalies have been identified. A data quality review checklist has been prepared by an **exp** staff member under the supervision of the Qualified Person for each laboratory submission. The checklist is appended with each Certificate of Analysis. All Certificates of Analysis meet the requirements under Section 47(3) of Regulation 153/04.

Quality Assurance/Quality Control Program

The laboratory QA/QC program consisted of one or more of the following analysis: a) instrument and extraction surrogate recoveries for soil and/or ground water samples that were analysed and b) the analysis of a method blank, laboratory duplicate, matrix spike and/or laboratory control samples for the analytical batches that were analysed. The laboratory QA/QC results are included in the certificates of analysis. As indicated, no laboratory QA/QC issues were identified that would have a material effect on the interpretation of results presented in this report.

The ground water field QA/QC program consisted of the following submission for laboratory analysis: one field duplicate sample for BTEX, hexane, PHC fractions F1 to F4, and lead; one field blank for BTEX, hexane, PHC fractions F1 to F4, and lead; and one trip blank for BTEX, hexane, PHC fractions F1 to F4, and lead.

For the field duplicate samples, evaluation of the QA/QC results were determined by calculating the relative percent difference (RPD) between the field duplicate and original sample results, and comparison of the RPD to designated alert limits. Consistent with laboratory practices and to permit reliable calculations, an RPD is only calculated when the original and duplicate sample concentrations are at least five times the reportable detections limits.

$$RPD = \left| \frac{(x_1 - x_2)}{\left(\frac{(x_1 + x_2)}{2}\right)} \right| \times 100\%$$

The RPD for the ground water field duplicate sample are provided in Table C-1, along with the designated field duplicate alert limits. All of the RPD were either within the alert limits or not calculable.

The ground water trip blank and field blank data were compared to the alert limits and are provided in Table C-2. All of the results were within the alert limits.

No field or laboratory QA/QC issues were identified that would affect the overall conclusions presented in this report. Overall, the results reported are considered to be reliable.

1 Introduction

Exp Energy Services Ltd. (**exp**) was retained by Imperial Oil to conduct a Phase II Environmental Site Assessment (ESA) along Merivale Road and Viewmount Drive adjacent to the Imperial Oil site located at 1660 Merivale Road, Ottawa, Ontario. This area of Merivale Road and Viewmount Drive will henceforth be referred to as the subject property. A locality plan is provided as Figure 1.

The objective of the Phase II ESA was to gain an understanding of subsurface conditions at the subject property. The Phase II ESA involved a soil and ground water sampling program. Parameters chosen for analysis during the Phase II ESA were based upon use of the adjacent Imperial Oil site as an operating gas station.

The environmental assessment standards for the subject property were determined using Ontario Regulation 153/04, as amended (Regulation 153/04), under Part XV.1 of the *Environmental Protection Act*. Soil and ground water samples were collected, preserved, and submitted to the Mississauga facility of Maxxam Analytics (Maxxam), a Standards Council of Canada (SCC) accredited laboratory.

Exp performed the environmental site assessment work in accordance with generally accepted professional practices. Subject to this standard of care, **exp** makes no express or implied warranties regarding its services and no third party beneficiaries are intended. Limitation of liability, scope of report and third party reliance are outlined in Appendix A.

2 Site Background

2.1 Site Description

The Imperial Oil site is located on the southwest corner of Merivale Road and Viewmount Drive in Ottawa, Ontario. The subject property includes the portions of Merivale Road and Viewmount Drive that are immediately adjacent to the Imperial Oil site. A locality plan is provided as Figure 1 and a site plan is provided as Figure 2.

Surrounding properties are used for residential, commercial and institutional purposes. The Imperial Oil site is located south and west of the subject property. Shopping Malls are located to the north and northeast and Merivale High School is located to the east.

2.2 Native Soils and Topography

The subject property is located in the physiographic region known as the Russell and Prescott Sand Plains. The surface soils are composed of sand and sandy loams (*Physiography of Southern Ontario*, Chapman and Putnam, 1984). Although sand is

predominant in the area, a silt till was encountered at the subject property. Merivale Road slopes slightly downwards towards the southeast and Viewmount Drive slopes slightly downward toward the southwest.

Based on field observations, the water table is located in the limestone bedrock. The hydraulic conductivity of the limestone bedrock at the Imperial Oil site was measured to be approximately 1.79 x 10^{-6} cm/s (Barenco, 2011). This value is consistent with typical values for this type of bedrock (Groundwater, Freeze and Cherry, 1979).

The soil at the subject property has been classified as a medium and fine-grained material based on grain size analysis performed on the Imperial Oil site.

2.3 Ground Water and Municipal Services

The subject and surrounding properties are serviced with municipal water, storm sewers and sanitary sewers by the City of Ottawa. According to the City of Ottawa, its municipal water supply comes from the Ottawa River.

The nearest surface water body is Nepean Creek (a tributary of the Rideau River), located approximately 250 metres southeast of the subject property. Table 1 summarizes the environmental setting and site characteristics.

3 Assessment Standards

Ontario Regulation 153/04, as amended, under Part XV.1 of the *Environmental Protection Act* provides generic remediation standards based on land use (agricultural, residential/ parkland/institutional, or industrial/commercial/community), ground water use (potable or non-potable), soil type (coarse or medium and fine textured), and restoration depth (full or stratified).

Regulation 153/04 also provides alternate methods for assessment and remediation based on either restoring soil and/or ground water to background conditions or the use of a risk assessment. Generic standards for both soil and ground water are outlined in a document entitled *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act*, April 15, 2011.

According to Regulation 153/04, a property is considered to be an environmentally sensitive area if one or more of the following applies:

a) The property is
   i) within an area of natural significance,
   ii) includes or is adjacent to an area of natural significance or part of such an area, or,

iii) includes land that is within 30 metres of an area of natural significance or part of such an area.

b) The soil at the property has a pH value as follows:
   i) for surface soil, less than 5 or greater than 9
   ii) for sub-surface soil, less than 5 or greater than 11

c) A qualified person is of the opinion that, given the characteristics of the property and the certification the qualified person would be required to make in a record of site condition in relation to the property as specified in Schedule A, it is appropriate to apply to this section of the property

An "area of natural significance" means any of the following:

1. An area reserved or set apart as a provincial park or conservation reserve under the *Provincial Parks and Conservation Reserves Act, 2006*
2. An area of natural and scientific interest (life science or earth science) identified by the Ministry of Natural Resources as having provincial significance
3. A wetland identified by the Ministry of Natural Resources as having provincial significance
4. An area designated by a municipality in its official plan as environmentally significant, however expressed, including designations of areas as environmentally sensitive, as being of environmental concern and as being ecologically significant
5. An area designated as an escarpment natural area or an escarpment protection area by the Niagara Escarpment Plan under the *Niagara Escarpment Planning and Development Act*
6. An area identified by the Ministry of Natural Resources as significant habitat of a threatened or endangered species
7. An area which is habitat of a species that is classified under section 7 of the *Endangered Species Act, 2007* as a threatened or endangered species
8. Property within an area designated as a natural core area or natural linkage area within the area to which the Oak Ridges Moraine Conservation Plan under the *Oak Ridges Moraine Conservation Act, 2001* applies
9. An area set apart as a wilderness area under the *Wilderness Areas Act*

The subject property would not be considered environmentally sensitive as none of the conditions above apply, and based on measurements made on the adjacent Imperial Oil site, the pH of soil on the subject property is likely to be within the applicable ranges for surface and subsurface soils.

In addition, the site condition standards for a shallow soil property or a surface water body in or near the property are not applicable to the subject property. A least 2/3 of the area of the subject property has soil to depths greater than 2 metres. It does not include all or part of a water body, nor is it adjacent to a water body, nor does it include land within 30 metres of a water body.

Based on the land use of the subject property as discussed in Section 2.1, the soil texture as discussed in Section 2.2, as well as the environmental setting data shown in Table 1, the subject property would be classified as having industrial/commercial/community property use in a non-potable ground water condition. Regulation 153/04 Table 3 standards for industrial/commercial/community property use and medium and fine textured soils are appropriate for evaluating conditions at the subject property.

4 Site Investigation

The objective of the site investigation was to evaluate subsurface conditions at the subject property. The investigation included the following activities:

- Inspecting soil conditions by drilling three test holes along Merivale Road and two test holes along Viewmount Drive and installing ground water monitors in all five test holes
- Field screening of all recovered soil samples for the presence of environmental impact (i.e. soil headspace petroleum vapour measurements, physical observations)
- Submitting selected soil samples for laboratory analysis of the potential contaminants of concern (PCOC) based upon use of the adjacent Imperial Oil site as an operating gas station
- Monitoring ground water levels in the five monitors to determine ground water elevations and ground water flow direction
- Submitting ground water samples from each of the monitors for laboratory analysis of the PCOC based upon use of the adjacent Imperial Oil site as an operating gas station
- Conducting soil and ground water sampling in accordance with the Ministry of the Environment (MOE) *Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario*, dated December 1996, in accordance with the MOE *Protocol for Analytical Methods used in the Assessment of Properties* under *Part XV.1 of the Environmental Protection Act*, March 2004, as amended, and per **exp** Standard Operating Procedures (SOP), and generally accepted professional practices

- Determining the appropriate Site Condition Standards in accordance with Regulation 153/04
- Comparing the results of the soil and ground water analyses to the applicable Standards

All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

4.1 Potential Contaminants of Concern

The PCOC for this assessment were benzene, toluene, ethylbenzene, xylenes (BTEX), petroleum hydrocarbon (PHC) fractions F1 to F4, select polycyclic aromatic hydrocarbons (PAH), and lead. The PCOC were chosen based upon use of the adjacent Imperial Oil site as an operating gas station.

4.2 Drilling Investigation

The drilling investigation was conducted from August 28 to 30, 2012. George Downing Estate Drilling Ltd. was contracted by **exp** to drill three test holes (TH10 to TH12) along Merivale Road and two test holes (TH8 and TH9) along Viewmount Drive. The test holes were drilled to the bedrock (a maximum depth of 2.4 metres below ground surface (mbgs)) using a CME 75 truck-mounted auger rig equipped with a split spoon sampler. All test holes were then cored to a maximum of 5.0 mbgs. The test holes were daylighted to a maximum depth of 2.1 mbgs using a hydrovacuum truck. Daylighting activities were performed to reduce the possibility that an unknown subsurface structure would be struck as drilling activities progressed. **Exp** retained Lacombe Waste Services (Lacombe) to provide the daylighting services. Soil cuttings from daylighting were disposed of at the Lacombe facility at 5555 Power Road, Ottawa, a MOE approved waste receiver.

Soil samples were collected as the drilling progressed at approximately 0.5 metre intervals using a hand auger in the daylighted portion of the test holes and from a 0.6 metre long split spoon from the daylighted portion to the bedrock. These samples were examined for geologic information and for physical evidence of chemical impact. No samples were collected from the bedrock portion of the test holes.

Soil samples were submitted to the laboratory from the "worst case" depth above the bedrock. Contaminant indicators such as physical observations and measured soil headspace vapour concentrations were used to direct sampling of "worst case" samples.

After each sample collection, the split spoon sampler and/or hand auger was thoroughly cleaned with phosphate-free soap and tap water and rinsed with distilled water, then methanol, to prevent cross-contamination of subsequent soil samples. Hollow stem auger

flights were cleaned with a brush between borehole locations. Following the conclusion of the drilling investigation, the drill rig was steam cleaned to decontaminate the equipment.

During the drilling investigation the following ground conditions were generally encountered:

0.0 to 1.1 mbgs	Brown SAND and GRAVEL (fill)
1.1 to 2.4 mbgs	Grey to brown SILT (till), some sand, trace gravel and clay
2.4 to 5.0 mbgs	Grey LIMESTONE

In conjunction with the bedrock coring activities, water was used to cool the bits. The coring water was obtained from CSM Water Services. The source of the coring water was the municipal water supply.

Readings of petroleum vapour concentrations in the soil samples collected during the drilling investigation were recorded using a RKI Eagle II, where there was sufficient recovery. It is equipped with three ranges of measurement, reading concentrations in parts per million by volume (ppmv), percentage lower explosive limit (%LEL) or in percent by volume (%vol).

The instrument was configured to eliminate any response from methane for all sampling conducted at the site. Instrument calibration is checked on a daily basis using a standard gas comprised of a known concentration of hexane (15% LEL) in air. If the instrument readings are within ±10% of the standard gas value, then the instrument is deemed to be calibrated, however if the readings are greater than ±10% of the standard gas value then the instrument is re-calibrated prior to use.

Soil samples are collected from the hand auger and split spoon using a stainless-steel spoon and placed into plastic bags. The samples are left to equilibrate within the bag at a temperature above 15° C for 30 minutes before measurement of the peak headspace concentration is taken. Petroleum vapours ranged from non-detectable to 180 ppmv in samples where there was sufficient recovery to perform vapour measurements.

The test hole logs are provided in Appendix C along with the MOE well record.

All test holes were completed as subsurface monitors. The monitors were constructed of 50 millimetre diameter threaded polyvinylchloride (PVC) pipe. The lower section of pipe was slotted (0.254 millimetre slot) above and below the water table, as observed during drilling. The upper section of the pipe is a solid riser. The lower part of the annulus of the hole was backfilled with clean sand (fine graded silica sand with an uniformity coefficient of 1.1-1.7 and an effective size of 1.5-3.0 mm, usually K&E Well Pack #3 Silica Sand) up to approximately 0.3 metres above the top of the slotted section. A bentonite seal (dry chipped sodium montmorillonite in 3/8-inch diameter chips) was placed above the sand to just below grade. Concrete was used to seal the monitor at grade. The monitors were equipped with

protective casings and locking lids. A diagram showing a typical monitor installation is provided in Appendix C.

Following the conclusion of the drilling investigation and installation of the monitors, all new monitors were developed by purging and surging a minimum of three well volumes of water.

4.3 Soil Chemical Analysis

Six soil samples, including one field duplicate sample, were collected during this investigation and submitted to Maxxam for analysis of BTEX, hexane, PHC fractions F1 to F4, select PAH, and lead. All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

The results of the soil chemical analysis for petroleum related parameters are provided in Table 2 and Figure 3, along with the applicable Regulation 153/04 Table 3 standards. All soil samples were within the applicable Table 3 standards for all parameters analysed.

The results of the soil chemical analysis for PAH are provided in Table 3 and Figure 4, along with the applicable Regulation 153/04 Table 3 standards. All soil samples were within the applicable Table 3 standards for all parameters analysed.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

4.4 Coring Water Chemical Analysis

One coring water sample was submitted for analysis for BTEX, hexane, and PHC fractions F1 to F4. All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

The results of the coring water chemical analysis are provided in Table 4, along with the applicable Ontario Regulation 153/04 Table 3 standards. The sample was within the applicable Table 3 standards for all parameters analysed.

A copy of the laboratory Certificates of Analysis is provided in Appendix D.

4.5 Ground Water Monitoring

The newly installed monitors (TH8 to TH12) were inspected for general physical condition, ground water depth, the presence of liquid petroleum and petroleum vapour concentrations on June 10, 2013. At this time, TH9 was buried under asphalt.

All measurements of ground water and phase-separated liquid petroleum depth are made with a Solinst Model 122 oil/water interface probe. Both the probe and the measuring tape

that come into contact with liquids within a monitor are cleaned with phosphate-free soap and water, rinsed with distilled water and then methanol after each measurement.

For all monitors in which phase-separated liquid petroleum is detected with the interface probe, the presence of liquid petroleum is verified with a bailer. For all monitors in which phase-separated liquid petroleum is not detected with the interface probe but that have a petroleum vapour reading of 5% LEL or higher, a bailer is used to check the monitor for the presence of phase-separated liquid petroleum. If there is measurable or observable phase-separated liquid petroleum in the bailer, then a ground water sample is not submitted for laboratory analysis from this location.

Following calibration of the RKI Eagle II, as described in Section 4.2, the ground water vapour concentrations were measured by placing the nozzle inside the monitoring well casing no less than six inches and no more than twelve inches below the top of pipe, immediately after the water well cap is removed. The peak reading is recorded.

Petroleum vapours ranged from 50 ppmv to 18% LEL. Liquid petroleum was not detected in any of the accessible monitors. The depth to the ground water table ranged from 2.75 mbgs (TH12) to 3.03 mbgs (TH10).

Based on the ground water depths measured during the June monitoring event and ground water elevation data shown in Table 5, ground water contours were plotted, as shown on Figure 5. The benchmark used for the monitor survey was the north side of the manhole cover on the west side of the kiosk with an assumed elevation of 100.00 metres. The location of this benchmark is shown on Figure 5. Based on the data, the ground water flow direction is interpreted to be southerly.

The horizontal gradient was calculated based on the ground water contour plan provided in Figure 5. The hydraulic gradient is approximately 0.01 m/m (change in hydraulic head per unit distance) towards the south.

Table 6 shows the Darcy's Law calculation of the estimated ground water flow velocity at the subject property. Based on measured hydraulic conductivity determined during a previous investigation on the Imperial Oil site and the hydraulic gradient, on the subject property, determined during the current investigation, the ground water flow velocity was estimated to be approximately 0.06 metres per year.

4.6 Ground Water Chemical Analysis

On June 10 and 11, 2013, ground water samples were collected from TH8 and TH10 to TH12. All ground water samples were collected using a low-flow sampling technique. This technique involves pumping ground water at low rates, typically less than 500 mL per minute, to minimize drawdown.

Prior to collecting the ground water samples, the monitors were purged with the low flow sampling equipment and field parameters (pH, conductivity, turbidity, dissolved oxygen, temperature and oxidation reduction potential) were monitored until stable readings were achieved. These parameters are considered to be stable when three consecutive readings are within 10% of one another. When stabilization occurs, equilibrium between ground water within a monitor and the surrounding formation water is attained. As such, samples collected when stabilization occurs are considered to be representative of formation water.

Five ground water samples, including one field duplicate sample, were collected and submitted to the Mississauga facility of Maxxam for chemical analysis of petroleum related parameters. All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

The results of the ground water chemical analysis for petroleum related parameters are provided in Table 7 and Figure 6, along with the applicable Regulation 153/04 Table 3 standards. All ground water samples exceeded the applicable Table 3 standards for PHC fractions F1 and F2, except the TH8 sample.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

5 Quality Management, Control and Assurance

The quality assurance and quality control measures are discussed in the Quality Management, Control and Assurance procedures outlined in Appendix B.

No field or laboratory QA/QC issues were identified that would affect the overall conclusions presented in this report. Overall, the results reported are considered to be reliable.

6 Current Site Status

During the drilling investigation, soil and ground water quality at the subject property were assessed. The results of soil and ground water sampling were compared to the Regulation 153/04 Table 3 standards for industrial/commercial/community property use and medium and fine textured soils. Soil and ground water samples were analysed for BTEX, PHC fractions F1 to F4, select PAH, and/or lead.

All soil samples were within the applicable Table 3 standards for all parameters that were analysed. Ground water samples collected from TH10, TH11, and TH12 exceeded the Table 3 standards for one or more petroleum parameters. The remaining ground water sample was within the applicable Table 3 standards for all parameters that were analysed.

We trust this report meets your current needs. If you require further information pertaining to this investigation, please do not hesitate to contact the undersigned.

Sincerely,
exp Energy Services Ltd.

Appendix A –
Limitation of Liability, Scope of Report and Third Party Reliance

LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by **exp** Energy Services Ltd. (**exp**) for Imperial Oil. It is intended for the sole and exclusive use of Imperial Oil, its affiliated companies and partners and the respective insurers, agents, employees and advisors (collectively, "Imperial Oil"). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and **exp** make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties, or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by **exp** with respect to this report and any conclusions or recommendations made in this report reflect **exp's** judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which the samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or the use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of **exp.** Nothing in this report is intended to constitute or provide a legal opinion.

Appendix B –
Quality Management, Control and Assurance

QUALITY MANAGEMENT, CONTROL AND ASSURANCE

Project Quality Management

The field work documented in this report and the preparation of this report were overseen by a Qualified Person, as defined in Ontario Regulation 153/04, as amended (Regulation 153/04).

Sampling analysis was performed using generally accepted principles and with appropriate sampling equipment. Written field and laboratory sampling procedures for soil and ground water developed by **exp** Energy Services Ltd. (**exp**) were used to ensure consistency in sample collection and preparation of samples for submission to the laboratory.

The staff involved in the field sampling have participated in regular, ongoing training programs and were qualified and experienced in collecting, describing, and preparing environmental samples for laboratory analysis.

Laboratory analysis was performed using generally accepted principles in accordance with the *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the* Environmental Protection Act, March 9, 2004 amended as of July 1, 2011 (Protocol).

Data quality objectives for the parameters of concern were set to meet acceptable RDLs to achieve the goal of defining areas where such parameters are present at levels in excess of applicable generic standards, as defined in Regulation 153/04. Sampling programs included providing written instruction to the analytical laboratory describing the required analyses on the Chain of Custody prepared and delivered with the samples.

The laboratory has a standing contract with Imperial Oil which sets out specific data quality requirements. Any non-compliance with this contract is documented using a data quality waiver issued by the laboratory. When a data quality waiver is issued by the laboratory, it must be reviewed, signed by **exp**, and returned to the laboratory. Data quality waivers are included with all reports, along with the complete Certificate of Analysis.

Field Quality Assurance/ Quality Control

The soil and ground water sampling plan was prepared and executed based on professional judgment at the time of the investigation.

Field observations were made and documented in a field book in accordance with generally accepted practices and with the procedures developed and utilized by **exp**.

Exp field sampling Quality Assurance and Quality Control (QA/QC) protocols are tailored to the investigation and include:

- The collection of at least one field duplicate sample for both soil and ground water for every ten samples or less (where three or more such samples are collected)

- For soil samples analysed for volatile organic compounds, including BTEX, the collection of discrete samples directly into vials containing methanol

- For soil samples analysed for all other parameters, the collection of discrete samples directly into jars

- For ground water samples, the collection of samples directly into vials with Teflon-lined lids or bottles containing an appropriate preservative, where required

- For ground water samples analysed for dissolved metals, including mercury and hexavalent chromium, filtration of the sample in the field using a 45 micron disposable filter prior to collection in a bottle containing preservative

- For ground water samples analysed for benzo(a)pyrene, where deemed necessary by the Qualified Person overseeing this work, the collection of an additional bottle for laboratory filtration prior to analysis

- The immediate placement, upon collection, of both soil and ground water samples into a cooler with free ice to lower the temperature to less than 10° C

- For soil sampling, the thorough cleaning of soil sampling equipment using soap and water, followed by a distilled water rinse and a methanol rinse between sample locations

- For ground water sampling, the use of dedicated sampling equipment at different monitors (including the use of dedicated tubing when low flow ground water sampling techniques are used)

- Ensuring that neither the bare hand nor latex glove comes into contact with the soil or ground water as it is being placed into the sample container

- The inclusion of one soil trip blank, at a frequency determined by the Qualified Person, when samples are being analysed for volatile organic compounds, including BTEX. The methanol-charged vials containing the trip blank are prepared by the laboratory: placed in a cooler with ice no later than the morning of the day of sampling (trip blank vials are not placed on ice by the laboratory); and returned to the laboratory unopened for analysis as part of the submission

- The inclusion of one soil field blank for PAH analysis at a frequency determined by the Qualified Person. The field blanks are prepared in the field with laboratory-

supplied silica during the sample collection process and returned to the laboratory for analysis as part of the submission

- The inclusion of one ground water field blank and trip blank per submission for all parameters in ground water except pH and electrical conductivity. The field blanks are prepared in the field during the sample collection process using laboratory-supplied water and returned to the laboratory for analysis as part of the submission. The trip blanks are prepared by the laboratory, kept in the cooler on ice for the duration of the sampling event and returned to the laboratory unopened for analysis as part of the submission

- All samples were shipped to the laboratory in custody sealed coolers, filled with ice at less than 10° C

- All sample shipments are accompanied by standard chain of custody forms

- For each analysis and matrix, Table B-1 describes the type of sample container and preservation technique used

The results of the field duplicate samples are presented along with the tabulated data in this appendix. Tabulated data are presented to a maximum of two significant digits.

Laboratory Quality Assurance/Quality Control

All laboratory analyses were completed by the Mississauga facility of Maxxam Analytics (Maxxam). This Maxxam laboratory has been accredited by the Standards Council of Canada (SCC) for all of the parameters that were analysed in accordance with the latest version of the International Standard ISO/IEC 17025 – "*General Requirement for the Competence of Testing and Calibration Laboratories*". Maxxam performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the Protocol.

Exp has accepted the data provided by Maxxam based on the assurance from Maxxam that, as a minimum, the following requirements have been met and documentation to demonstrate compliance can be produced on request:

- The method performance criteria identified in the Protocol were met

- Sample storage requirements, pre-analysis processing techniques, and holding times for all sample types as identified in the Protocol were met following receipt and sign-off of the samples from **exp** staff

- The results of all laboratory QC samples were within statistically determined control limits and if not, reasons were provided

- Surrogate recoveries for organic analyses were monitored and recorded

- Details on the precision and accuracy of the data have been recorded and retained and are available from the laboratory should they be required as a result of a Ministry of the Environment (MOE) audit

- The analytical data were reported without blank correction (unless the correction was clearly identified on the Certificate of Analysis)

- All soil sampling results were reported on a dry weight basis

- All laboratory QA/QC sample data, including method blanks, matrix spikes, matrix duplicates, laboratory control samples, and surrogate recoveries, were included in the Certificate of Analysis

All Certificates of Analysis were reviewed by the Qualified Person to ensure that data quality objectives have been met and that any anomalies have been identified. A data quality review checklist has been prepared by an **exp** staff member under the supervision of the Qualified Person for each laboratory submission. The checklist is appended with each Certificate of Analysis. All Certificates of Analysis meet the requirements under Section 47(3) of Regulation 153/04.

Quality Assurance/Quality Control Program

A summary of laboratory data quality waivers and other laboratory and field data quality issues is provided in Table B-2. No issues were identified that would have a material effect on the interpretation of results presented in this report.

The soil field QA/QC program consisted of the following submission for laboratory analysis: one field duplicate sample for benzene, toluene, ethylbenzene, xylenes (BTEX), hexane, petroleum hydrocarbon (PHC) fractions F1 to F4, selected polycyclic aromatic hydrocarbons (PAH), and lead; one trip blank for BTEX, hexane, and PHC fraction F1; and one field blank for selected PAH.

The ground water field QA/QC program consisted of the following submission for laboratory analysis: one field duplicate sample for BTEX, hexane, PHC fractions F1 to F4, and lead; one field blank for BTEX, hexane, PHC fractions F1 to F4, and lead; and one trip blank for BTEX, hexane, PHC fractions F1 to F4, and lead.

For the field duplicate samples, evaluation of the QA/QC results were determined by calculating the relative percent difference (RPD) between the field duplicate and original sample results, and comparison of the RPD to designated alert limits. Consistent with laboratory practices and to permit reliable calculations, an RPD is only calculated when the original and duplicate sample concentrations are at least five times the reportable detections limits.

$$RPD = \left| \frac{(x_1 - x_2)}{\left(\frac{(x_1 + x_2)}{2}\right)} \right| \times 100\%$$

The RPD for the soil field duplicate samples are provided in Tables B-3 and B-4, along with the designated field duplicate limits. All of the RPD were not calculable.

The soil trip blank and field blank data were compared to the alert limits and are provided in Tables B-5 and B-6. All of the results were within the alert limits.

The RPD for the ground water field duplicate sample are provided in Table B-7. All of the RPD were either within the alert limits or not calculable.

The ground water trip blank and field blank data were compared to the alert limits and are provided in Table B-8. All of the results were within the alert limits.

No field or laboratory QA/QC issues were identified that would affect the overall conclusions presented in this report. Overall, the results reported are considered to be reliable.

Table B-1

SAMPLE CONTAINERS AND PRESERVATIVES

Adjacent to 1660 Merivale Road, Ottawa, Ontario

Parameter Group	Matrix	Container	Preservative
BTEX/F1 hexane	Soil	2 x 40 mL C/G TL septum cap vial	Less than 10°C Methanol
F2-F4	Soil	60 or 120 mL C/G TL	Less than 10°C
PAH	Soil	120 mL C/G TL	Less than 10°C
Metals	Soil	120 or 250 mL C/G	Less than 10°C
PAH	Soil	120 mL C/G TL	Less than 10°C
BTEX/F1 hexane	Ground Water	4 x 40 mL C/G TL septum cap vial	Less than 10°C 18% $NaHSO_4$
F2-F4	Ground Water	2 x 500mL A/G TL	Less than 10°C 15% $NaHSO_4$
F4 Gravimetric	Ground Water	1 x 1L A/G TL	Less than 10°C 15% HCl
Metals (Lead Only)	Ground Water	120 mL HDPE	Less than 10°C 18% HNO_3

A/G means "amber glass"; C/G means "clear glass"; HDPE means "High Density Polyethylene"; TL means "Teflon-lined lid"

Table B-2

DATA QUALITY WAIVERS AND OTHER DATA ISSUES

Adjacent to 1660 Merivale Road, Ottawa, Ontario

Maxxam Job #	DQW #	Matrix	Sample ID	Test Affected	Deviation	Interpretation
B2D4498	NA	Water	W1	PHC F1-F4	D10-ethylbenzene instrument surrogate recovery (34%) is below the acceptance criteria (60-140%)	Possible low bias in reported PHC F1-F4 results for this sample. Since all PHC F1-F4 results were below the detection limits and the detection limits are well below the Table 3 standards, the possible low bias should have no material effect on the interpretation of the data

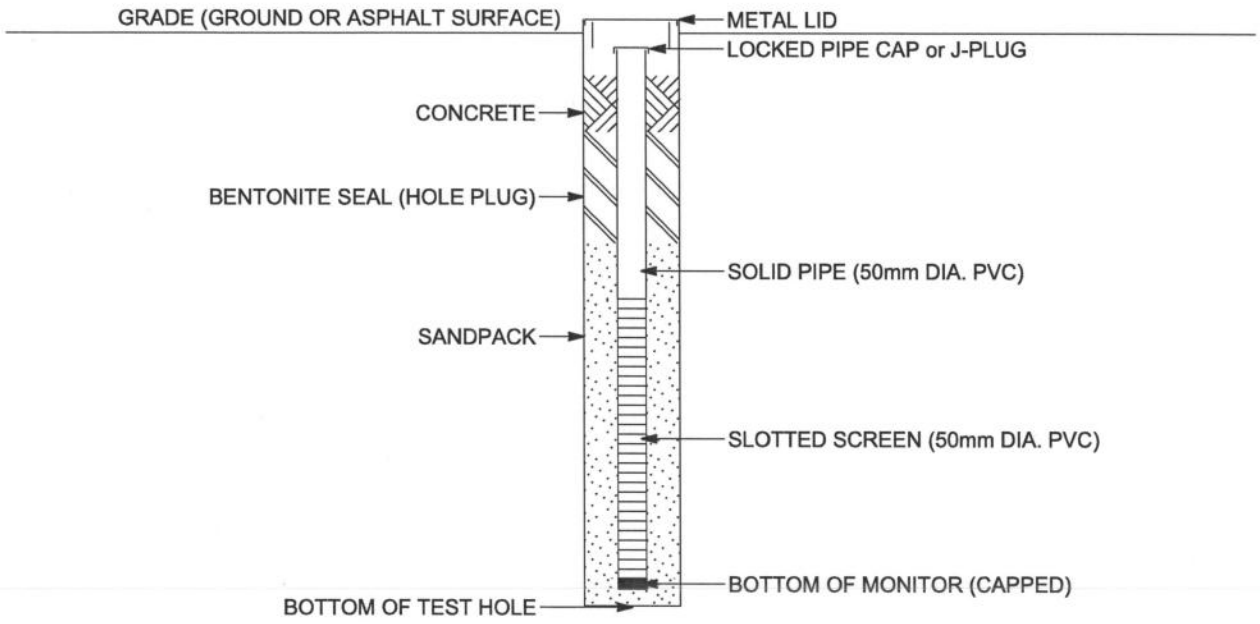
All results in ppb (ug/L) unless otherwise indicated; nd means "not detected" at reporting detection limit (RDL); na means "not analysed"

* Analytical RDL are shown except as indicated in brackets

Exceedances of alert limits are shown in **bold**

Appendix C –
Test Hole Logs and MOE Well Record

LEGEND
exp TEST HOLE LOGS



STANDARD INFORMATION (applies to all test holes on this project, unless otherwise noted in the legend or log)

Project Site & Number:	Adjacent to 1660 Merivale Road, Ottawa, Ontario Job #11010
Drilling Contractor:	George Downing Estate Drilling Ltd.
Test Hole Diameter:	216 mm
Monitor Details:	Casing Type = Steel Flush Mounted Casing Screen Type = PVC 50 mm diameter with a 0.010" slot Riser Type = PVC 50 mm diameter (see typical monitor legend for further details)
Dedicated Sampling Equipment:	None
Site Benchmark:	Elevations are related to the north side of the manhole cover on the west side of the kiosk, assumed elevation = 100.00 metres (**exp**, 2013)
Other Notes:	The attached test hole logs are part of the complete report and are to be used only in conjunction with the report. The test holes were drilled using a Mobil B-60 rotary hollow stem auger rig to the maximum depth of the investigation
Attached Graphical Legends:	Refer to Soil Symbol Identification Detail Refer to Typical Monitor Construction Detail

CONVENTIONS USED IN PARAMETER ANALYSIS

ABBREVIATIONS	PARAMETERS INCLUDED
F1-F4	Petroleum Hydrocarbon Fractions F1 to F4
BTEX	Benzene, Toluene, Ethylbenzene, Xylenes
BTEXH	Benzene, Toluene, Ethylbenzene, Xylenes, Hexane
VOC	Full Suite of Volatile Organic Compounds
CVOC	Chlorinated Volatile Organic Compounds (1,1-Dichloroethane, 1,2-Dichloroethane, 1,1-Dichloroethylene, cis-1,2-Dichloroethylene, trans-1,2-Dichloroethylene, Ethylene Dibromide, Methyl t-Butyl Ether, Tetrachloroethylene, 1,1,1-Trichloroethane, 1,1,2-Trichloroethane, Trichloroethylene, Vinyl Chloride)
CFC	Chlorofluorocarbons (Dichlorodifluoromethane (FREON 12), Trichlorofluoromethane (FREON 11))
1,2-DCA, EDB, MTBE	1,2-Dichloroethane, Ethylene Dibromide, Methyl t-Butyl Ether only
Selected VOC	Any variation of Volatile Organic Parameters not listed above
SVOC	Semivolatile Organic Compounds (Includes PAH, CP, ABN)
PAH	Full Suite of Polycyclic Aromatic Hydrocarbons
2 & 3 Ring PAH	2- & 3- Ring Polycyclic Aromatic Hydrocarbons (Acenaphthene, Acenaphthylene, Anthracene, Fluoranthane, Fluorene, 1-Methylnaphthalene, 2-Methylnaphthalene, Total Methylnaphthalene, Naphthalene, Phenanthrene)
Selected PAH	Any variation of Polycyclic Aromatic Hydrocarbons not listed above
CP	Chlorophenols
ABN	Acid-Base Neutral Compounds
Metals	Full Suite of Metals (may or may not include Hot Water Boron and Mercury)
Pb	Lead only
6 Metals	Arsenic, Barium, Chromium, Copper, Lead, Zinc
Selected Metals	Any variation of Metal parameters not listed above
pH	Hydrogen Ion Concentration
OCP	Organochlorine Pesticides
PCB	Total Polychlorinated Biphenyls (includes Aroclor 1242, 1248, 1252, 1262)
1,4 - Dioxane	1,4 - Dioxane
D/F	Dioxins/Furans
SAR	Sodium Adsorption Ratio
FOC	Fraction of Organic Carbon

Well Record for Well Cluster - Part 2 of 3
Land Owner Consent

This form is to be completed by the person who constructs or abandons test holes or dewatering wells that form all or part of a well cluster. If this form is being used to report any well abandonment, these wells must have been previously reported as part of a single well cluster.

Note: For well cluster records, only the owners of the land on which the wells are situated are to give written consent. If the well purchaser (e.g. a consultant who hires the driller) is not the owner of the land, then the well purchaser cannot sign the consent form.

By signing this form, land owners are providing consent to use one well record to report a well cluster of test holes or dewatering wells in accordance with section 16.4 of Regulation 903 made under the *Ontario Water Resources Act.*

This completed **Well Record for Well Cluster Part 2 - Land Owner Consent** must be attached to Parts 1 and 3.

* Please PRINT if completing by hand.

Well Record for Well Cluster - Part 3 of 3
Detailed Drawing of All Well Locations

Note: This **Well Record for Well Cluster Part 3 - Detailed Drawing of all Well Locations,** must be attached to Parts 1 and 2. The drawing must include all property boundaries, an arrow indicating the North direction, all named roads and sufficient measurements to locate all wells in the cluster in relation to fixed points. The drawing must show the location of each well and each well must be numbered on the drawing to match number used for that well on the **Well Record for Well Cluster Parts 1 and 2.** The well with the well tag must be clearly identified on the Drawing.
UTM coordinates should appear beside each well, if space permits. Additional comments on wells can be included on the drawing

Appendix D –
Laboratory Certificates of Analysis

Attached are copies of the original Certificates of Analysis provided by the laboratory. The data contained in these analyses is to be read only in conjunction with the report to which it is attached. For interpretation of the chemical data, see the attached text.

Since the laboratory data contains scientific terms and references, only trained persons familiar with sampling and laboratory methods should attempt to interpret the data contained in the Certificates of Analysis.

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples

N/A = Not Applicable
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd. Sampling Date: August 29, 2012

Location: 1660 Merivale Road, Ottawa Laboratory : Maxxam Analytics

Consultant Project Number: 11010 Sample Submission Number: B2D4309

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits.
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples

LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B2D4498
Received: 2012/08/31, 13:35

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Laboratory Method	Method Primary Reference
Petroleum Hydro. CCME F1 & BTEX in Water	1	CAM SOP-00315	CCME CWS
Petroleum Hydrocarbons F2-F4 in Water	1	CAM SOP-00316	CCME Hydrocarbons

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B2D4994
Received: 2012/09/04, 12:55

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd.

Sampling Date: August 30, 2012

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics

Consultant Project Number: 11010

Sample Submission Number: B2D4994

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples submitted.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

White: Maxxam Yellow: Client

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd. Sampling Date: August 31, 2012

Location: 1660 Merivale Road, Ottawa Laboratory : Maxxam Analytics

Consultant Project Number: 11010 Sample Submission Number: B2D4997

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration	X			All field QC samples are within alert limits.
Trip Blank Concentration	X			
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B393127
Received: 2013/06/13, 15:50

Sample Matrix: Water
Samples Received: 5

Analyses	Quantity	Laboratory Method	Method Primary reference
Petroleum Hydro. CCME F1 & BTEX in Water	5	CAM SOP-00315	CCME CWS
Petroleum Hydrocarbons F2-F4 in Water	5	CAM SOP-00316	CCME Hydrocarbons
Dissolved Metals by ICPMS	5	CAM SOP-00447	EPA 6020

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

GENERAL COMMENTS

Sample RW8215-01: F1/BTEX Analysis:
Due to high concentration of target analytes, sample required dilution. Reporting limits were adjusted accordingly.

Sample RW8216-01: F1/BTEX Analysis:
Due to high concentration of target analytes, sample required dilution. Reporting limits were adjusted accordingly.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd. Sampling Date: June 11, 2013

Location: 1660 Merivale Road, Ottawa Laboratory : Maxxam Analytics

Consultant Project Number: 11010 Sample Submission Number: B393127

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits.
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Not Required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

MAXXAM JOB #: B393184
Received: 2013/06/13, 15:50

Sample Matrix: Water
Samples Received: 2

Analyses	Quantity	Laboratory Method	Method Primary reference
Petroleum Hydro. CCME F1 & BTEX in Water	2	CAM SOP-00315	CCME CWS
Petroleum Hydrocarbons F2-F4 in Water	2	CAM SOP-00316	CCME Hydrocarbons
Dissolved Metals by ICPMS	2	CAM SOP-00447	EPA 6020

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Re: 1660 Merivale Road, Ottawa, Ontario
IOL Site Number 302620
2013 Ground Water Monitoring and Sampling Program Report

INTRODUCTION

Exp Energy Services Ltd. **(exp)** was retained by Imperial Oil to conduct a ground water monitoring and sampling program at 1660 Merivale Road in Ottawa, Ontario (henceforth referred to as the subject property). Monitoring and ground water sampling activities were conducted on June 12 and 13, 2013. The objective of this work was to evaluate ground water conditions at the subject property.

A locality plan is provided as Figure 1. A site plan showing the monitor locations is provided as Figure 2.

Exp performed the environmental assessment work in accordance with generally accepted professional practices. Subject to this standard of care, **exp** makes no express or implied warranties regarding its services and no third party beneficiaries are intended. Limitation of liability, scope of report and third party reliance are outlined in Appendix A.

THIS REPORT CONTAINS PROVISIONS LIMITING LIABILITY, THE SCOPE OF THE REPORT AND THIRD PARTY RELIANCE

These documents and the information contained therein are confidential, property of Imperial Oil and any disclosure of same is governed by the provisions of each of the applicable provincial and territorial freedom of information legislation, the Privacy Act (Canada) 1980-81-82-83, c.111, Sch. II"1", and the Access to Information Act (Canada) 1980-81-82-83, c.111, Sch .I"1", as such legislation may be amended from time to time.

220 Commerce Valley Drive West, Suite 500, Markham, ON L3T 0A8, Canada
T: +1.905.695.3217 • www.exp.com

SCOPE OF WORK

The scope of work was to perform the following activities:

- Monitor all monitors (TH1 to TH7) for subsurface vapour concentrations, water levels and the presence or absence of phase-separated liquid petroleum
- Collect ground water samples from all monitors and submit to the laboratory for analysis of benzene, toluene, ethylbenzene, and xylenes (BTEX), hexane, petroleum hydrocarbon fractions (PHC) F1 to F4 and lead
- Compare the ground water analytical results to the applicable Ontario Regulation 153/04 standards
- Prepare a report documenting the results of field activities and laboratory analyses

All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix B.

FIELD ACTIVITIES

Ground Water Monitoring

The accessible subsurface monitors on the subject property were inspected for general physical condition, ground water depth, the presence of phase-separated liquid petroleum and petroleum vapour concentrations on June 12, 2013. The monitors were generally monitored in order of least impacted to most impacted (based on historical ground water data).

All measurements of petroleum vapours in the monitor riser were made with a RKI Eagle II in methane elimination mode. Immediately after removing the well cap, the collection tube of the RKI Eagle 2 was inserted into the riser and the peak instrument reading was recorded.

Instrument calibration is checked on a daily basis using a standard gas comprised of a known concentration of hexane (15% LEL) in air. If the instrument readings are within ±10% of the standard gas value, then the instrument is deemed to be calibrated, however if the readings are greater than ±10% of the standard gas value then the instrument is re-calibrated prior to use.

All measurements of ground water and phase-separated liquid petroleum depth are made with a Solinst Model 122 oil/water interface probe. Both the probe and the measuring tape

that come into contact with liquids within a monitor are cleaned with phosphate-free soap and tap water, rinsed with distilled water and then finally rinsed with methanol after each measurement.

For all monitors in which phase-separated liquid petroleum is detected with the interface probe, the presence of liquid petroleum is verified with a bailer. For all monitors in which phase-separated liquid petroleum is not detected with the interface probe but that have a petroleum vapour reading of 5% LEL or higher, a bailer is used to check the monitor for the presence of phase-separated liquid petroleum. If there is measurable or observable phase-separated liquid petroleum in the bailer, then a ground water sample is not submitted for laboratory analysis from this location.

Ground Water Sampling and Analysis

Ground water samples were collected from all seven monitors on June 13, 2013. Prior to sampling, the monitors were purged by removing approximately three well volume equivalents of ground water. The water level in the monitor was allowed to recover to at least 90% of its static level prior to sample collection.

All ground water samples were collected using a bailer individually dedicated to each monitor. Samples for BTEX, hexane, and PHC fraction F1 were collected in 40 mL clear glass vials (with zero headspace), pre-charged with sodium bisulphate ($NaHSO_4$) preservative. Samples for analysis of PHC fractions F2 to F4 were collected in two 500 mL amber bottles, pre-charged with $NaHSO_4$ preservative. Samples for F4 Gravimetric analysis were collected in 1L amber bottles pre-charged with hydrochloric acid (HCl) preservative. Samples for analysis of lead were field filtered using 0.45 µm in-line filters and collected in 250 mL high-density polyethylene (HDPE) bottles, pre-charged with nitric acid preservative. All sample bottles were supplied by the laboratory. The ground water samples were placed into a cooler with ice at less than 10°C.

The samples were submitted to the Mississauga facility of Maxxam Analytics (Maxxam). Maxxam is a Standards Council of Canada (SCC) accredited laboratory. Further details are provided in Appendix B.

Quality Assurance and Quality Control Sampling

A quality assurance and quality control program (QA/QC) was implemented to reduce and quantify potential issues introduced during sample collection. Further details are provided in Appendix B.

RESULTS

During the June 12, 2013 monitoring event, all seven monitors were inspected. Liquid petroleum was not measured in any monitor. Petroleum vapours ranged from non-detectable to 290 ppmv. Results are summarised in Table 1.

The depth to ground water within the monitors ranged from 3.06 (TH3) to 3.49 (TH1) metres below ground surface. Based on the ground water depths measured during the monitoring event and ground water elevation data shown in Table 1, ground water contours were plotted, as shown on Figure 3. The benchmark used for the monitor survey was the north side of manhole cover on the west side of the kiosk with an assumed elevation of 100.00 metres (m). The ground water flow direction is interpreted to be southerly.

During the June 13, 2013 sampling event, eight samples, including one field duplicate, were collected and submitted to Maxxam for chemical analysis of BTEX, hexane, PHC fractions F1 to F4 and lead. A field and trip blank were also submitted for analysis of these parameters.

Ontario Regulation 153/04 Table 3 standards for an industrial/commercial/community property use and medium and fine textured soils and non-potable ground water use are appropriate for evaluating conditions at the subject property, based on previous environmental assessment work at the subject property. The results of the ground water chemical analysis, along with the appropriate Table 3 standards, are provided in Table 2.

All of the samples exceeded the applicable Table 3 Standards except samples from TH1, TH2 and TH6. Current and historical ground water analytical data are shown on Figure 4. Copies of the laboratory Certificates of Analysis are provided in Appendix C.

Quality Assurance and Quality Control Results

The results of the laboratory and field quality assurance and quality control program are provided in Appendix B. No laboratory or field QA/QC issues were identified that called into question the reliability of the laboratory data reported.

In summary, no QA/QC issues were identified that would affect the overall conclusions for the ground water monitoring and sampling event described in this report.

CLOSURE

We trust this report meets your current needs. If you require further information pertaining to this investigation, please do not hesitate to contact the undersigned.

Sincerely,

exp Energy Services Ltd.

Imperial Oil and **exp** make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties, or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

The investigation undertaken by **exp** with respect to this report and any conclusions or recommendations made in this report reflect **exp's** judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which the samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or the use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of **exp.** Nothing in this report is intended to constitute or provide a legal opinion.

Appendix B –
Quality Management, Control and Assurance

QUALITY MANAGEMENT, CONTROL AND ASSURANCE

Project Quality Management

The field work documented in this report and the preparation of this report were overseen by a Qualified Person, as defined in Ontario Regulation 153/04, as amended (Regulation 153/04).

Sampling analysis was performed using generally accepted principles and with appropriate sampling equipment. Written field and laboratory sampling procedures for soil and ground water developed by **exp** Energy Services Ltd. (**exp**) were used to ensure consistency in sample collection and preparation of samples for submission to the laboratory.

The staff involved in the field sampling have participated in regular, ongoing training programs and were qualified and experienced in collecting, describing, and preparing environmental samples for laboratory analysis.

Laboratory analysis was performed using generally accepted principles in accordance with the *Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the* Environmental Protection Act, March 9, 2004 amended as of July 1, 2011 (Protocol).

Data quality objectives for the parameters of concern were set to meet acceptable RDLs to achieve the goal of defining areas where such parameters are present at levels in excess of applicable generic standards, as defined in Regulation 153/04. Sampling programs included providing written instruction to the analytical laboratory describing the required analyses on the Chain of Custody prepared and delivered with the samples.

The laboratory has a standing contract with Imperial Oil which sets out specific data quality requirements. Any non-compliance with this contract is documented using a data quality waiver issued by the laboratory. When a data quality waiver is issued by the laboratory, it must be reviewed, signed by **exp**, and returned to the laboratory. Data quality waivers are included with all reports, along with the complete Certificate of Analysis.

Field Quality Assurance/ Quality Control

The ground water sampling plan was prepared and executed based on previous assessment work including the findings of the Phase I assessment conducted for the site, and on professional judgment at the time of the investigation.

Field observations were made and documented in a field book in accordance with generally accepted practices and with the procedures developed and utilized by **exp**.

Exp field sampling Quality Assurance and Quality Control (QA/QC) protocols are tailored to the investigation and include:

- The collection of at least one field duplicate sample for every ten samples or less (where three or more such samples are collected)
- For ground water samples, the collection of samples directly into vials with Teflon-lined lids or bottles containing an appropriate preservative, where required
- For ground water samples analysed for dissolved metals, including mercury and hexavalent chromium, filtration of the sample in the field using a 45 micron disposable filter prior to collection in a bottle containing preservative
- For ground water samples analysed for benzo(a)pyrene, where deemed necessary by the Qualified Person overseeing this work, the collection of an additional bottle for laboratory filtration prior to analysis
- The immediate placement, upon collection, of ground water samples into a cooler with free ice to lower the temperature to less than 10^{o} C
- For ground water sampling, the use of dedicated sampling equipment at different monitors (including the use of dedicated tubing when low flow ground water sampling techniques are used)
- Ensuring that neither the bare hand nor latex glove comes into contact with the ground water as it is being placed into the sample container
- The inclusion of one ground water field blank and trip blank per submission for all parameters in ground water except pH and electrical conductivity. The field blanks are prepared in the field during the sample collection process using laboratory-supplied water and returned to the laboratory for analysis as part of the submission. The trip blanks are prepared by the laboratory, kept in the cooler on ice for the duration of the sampling event and returned to the laboratory unopened for analysis as part of the submission
- All samples were shipped to the laboratory in custody sealed coolers, filled with ice at less than 10^{o} C
- All sample shipments are accompanied by standard chain of custody forms

The results of the field duplicate samples are presented along with the tabulated data in this appendix. Tabulated data are presented to a maximum of two significant digits.

Laboratory Quality Assurance/Quality Control

All laboratory analyses were completed by the Mississauga facility of Maxxam Analytics (Maxxam). This Maxxam laboratory has been accredited by the Standards Council of Canada (SCC) for all of the parameters that were analysed in accordance with the latest version of the International Standard ISO/IEC 17025 – "*General Requirement for the Competence of Testing and Calibration Laboratories*". Maxxam performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the Protocol.

Exp has accepted the data provided by Maxxam based on the assurance from Maxxam that, as a minimum, the following requirements have been met and documentation to demonstrate compliance can be produced on request:

- The method performance criteria identified in the Protocol were met
- Sample storage requirements, pre-analysis processing techniques, and holding times for all sample types as identified in the Protocol were met following receipt and sign-off of the samples from **exp** staff
- The results of all laboratory QC samples were within statistically determined control limits and if not, reasons were provided
- Surrogate recoveries for organic analyses were monitored and recorded
- Details on the precision and accuracy of the data have been recorded and retained and are available from the laboratory should they be required as a result of a Ministry of the Environment (MOE) audit
- The analytical data were reported without blank correction (unless the correction was clearly identified on the Certificate of Analysis)
- All laboratory QA/QC sample data, including method blanks, matrix spikes, matrix duplicates, laboratory control samples, and surrogate recoveries, were included in the Certificate of Analysis

All Certificates of Analysis were reviewed by the Qualified Person to ensure that data quality objectives have been met and that any anomalies have been identified. A data quality review checklist has been prepared by an **exp** staff member under the supervision of the Qualified Person for each laboratory submission. The checklist is appended with each Certificate of Analysis. All Certificates of Analysis meet the requirements under Section 47(3) of Regulation 153/04.

Quality Assurance/Quality Control Program

A summary of laboratory data quality waivers and other laboratory and field data quality issues is provided in Table B-1. No issues were identified that would have a material effect on the interpretation of results presented in this report.

The ground water field QA/QC program consisted of the following submission for laboratory analysis: one field duplicate sample for BTEX, hexane, PHC fractions F1 to F4, and lead; one field blank for BTEX, hexane, PHC fractions F1 to F4, and lead; and one trip blank for BTEX, hexane, PHC fractions F1 to F4, and lead.

For the field duplicate samples, evaluation of the QA/QC results were determined by calculating the relative percent difference (RPD) between the field duplicate and original sample results, and comparison of the RPD to designated alert limits. Consistent with laboratory practices and to permit reliable calculations, an RPD is only calculated when the original and duplicate sample concentrations are at least five times the reportable detections limits.

$$RPD = \left| \frac{(x_1 - x_2)}{\left(\frac{(x_1 + x_2)}{2}\right)} \right| \times 100\%$$

The RPD for the ground water field duplicate sample are provided in Table B-2. All of the RPD were either within the alert limits or not calculable.

The ground water field blank and trip blank data were compared to the alert limits and are provided in Table B-3. All of the results were within the alert limits.

No field or laboratory QA/QC issues were identified that would affect the overall conclusions presented in this report. Overall, the results reported are considered to be reliable.

Table B-1

DATA QUALITY WAIVERS AND OTHER DATA ISSUES

1660 Merivale Road, Ottawa, Ontario

Maxxam Job #	DQW #	Matrix	Sample ID	Test Affected	Deviation	Interpretation
B394079	1740	Ground Water	TH4	F2 to F4	Matrix duplicate RPD for F2 (58.3%) is above the acceptance criterion (30%)	Poor reproducibility for F2 in the matrix duplicate of TH4. Since results for both TH4 and its matrix duplicate are well above the Table 3 standard for F2, the deviation should have no material effect on the interpretation of the F2 results for this sample.

Table B-2

GROUND WATER FIELD DUPLICATES

Relative Percent Differences - Petroleum Related Parameters

1660 Merivale Road, Ottawa, Ontario

June 13, 2013

Location Maxxam I.D.		TH5 RX2634	DUP2 (TH5) RX2639	RPD (%)	Alert Limit (%)

Appendix C –
Laboratory Certificates of Analysis

Attached are copies of the original Certificates of Analysis provided by the laboratory. The data contained in these analyses is to be read only in conjunction with the report to which it is attached. For interpretation of the chemical data, see the attached text.

Since the laboratory data contains scientific terms and references, only trained persons familiar with sampling and laboratory methods should attempt to interpret the data contained in the Certificates of Analysis.

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

RDL = Reportable Detection Limit
Lab-Dup = Laboratory Initiated Duplicate
QC Batch = Quality Control Batch
(1) Duplicate results exceeded RPD acceptance criteria for flagged analytes. The sample was reanalysed with the same results.This is likely due to sample heterogeneity.

GENERAL COMMENTS

Sample RX2633-01: Metals Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

Sample RX2634-01: F1/BTEX Analysis:
Due to high concentration of target analytes, sample required dilution. Reporting limits were adjusted accordingly.

Metals Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

Sample RX2635-01: F1/BTEX Analysis:
Due to high concentration of target analytes, sample required dilution. Reporting limits were adjusted accordingly.

Metals Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

Sample RX2639-01: F1/BTEX Analysis:
Due to high concentration of target analytes, sample required dilution. Reporting limits were adjusted accordingly.

Metals Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) Duplicate results exceeded RPD acceptance criteria for flagged analytes. The sample was reanalysed with the same results.This is likely due to sample heterogeneity.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: **exp** Energy Services Ltd.

Sampling Date: June 13, 2013

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics

Consultant Project Number: 11010

Sample Submission Number: B394079

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			Matrix duplicate RPD for F2 (58.3%) is above the acceptance criteria (30%). All other laboratory QC met acceptance criteria
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD		X		
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Not applicable
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: Yes

Date Issued: June 24, 2013

Date of Response: June 26, 2013

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Petroleum Hydrocarbons F2-F4 in Water	2	CAM SOP-00316	CCME Hydrocarbons
Dissolved Metals by ICPMS	2	CAM SOP-00447	EPA 6020

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. Reporting results to two significant figures at the RDL is to permit statistical evaluation and is not intended to be an indication of analytical precision.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O.Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

LCS: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

M3C 1K5

Tank Replacement Program – 1660 Merivale Road, Ottawa, Ontario
TSSA Service Request # 791084

Dear Ms. Wong,

Thank you for submitting the following reports prepared by Barenco Inc. (Barenco) for the above referenced property. Barenco reports along with details are provided below:

- "*Phase II Environmental Assessment – 1660 Merivale Road, Ottawa, Ontario*", prepared by Barenco and dated September 14, 2011;
    - Barenco reports that they have conducted a Phase Two Environmental Site Assessment (ESA) on behalf of Imperial oil between August 23 and 31, 2011 by drilling five (5) boreholes (TH1 to TH5) and completing all of them as monitoring wells to understand soil and groundwater conditions at the site prior to its redevelopment. Barenco retained George Downing Estate Drilling Ltd to complete this activity.
    - Barenco reports that during drilling activities bed rock was encountered between 2.7 and 3.4 m below grade. However, monitoring wells were installed at a depth of 5.8 m below ground by coring into the bedrock.
    - Barenco collected a total of seven (7) soil samples including two (2) field duplicate and analysed for the laboratory analysis of benzene, toluene, ethylbenzene and xylenes (BTEX), petroleum hydrocarbon fractions (PHC F1 to F4), hexane, polycyclic aromatic hydrocarbons (PAHs) and metals. In addition, one soil sample was submitted and analysed for waste classification.
    - Barenco collected six (6) groundwater samples including one (1) field duplicate sample and submitted for the laboratory analysis of selected volatile organic compounds (including BTEX) and PHC F1 to F4 and lead.
    - Barenco selected the Ontario Ministry of the Environment (MOE) (O. Reg. 153/04) Table 3 full depth generic Site Condition Standards (SCS) for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
    - Barenco reports that the depth to groundwater at the site ranged from 3.25 meters below ground surface (mbgs) to 4.21 mbgs and the inferred direction of groundwater flow was appears to be southwesterly.
    - Barenco reports that all soil samples analysed met the selected MOE Table 3 SCS.
    - Barenco reports that all groundwater samples analysed met the selected MOE Table 3 SCS with the exception of TH3/DUP1, TH4 and TH5 that exceeded one or more of BTEX and PHC F1 to F4.

- "Baseline *Environmental Assessment – 1660 Merivale Road, Ottawa, Ontario"*, prepared by Barenco and dated December 5, 2011
    - Barenco conducted a due diligence baseline assessment at the property to gain an understanding of the subsurface conditions at the subject site.
    - Barenco completed drilling investigation between October 18 and 19, 2011 by drilling two (2) boreholes (TH6 and TH7) and completing them as monitoring wells. Day lighting of boreholes and disposal of drill cuttings were completed by Veolia Environmental Services.
    - Barenco reportedly collected four (4) soil samples including one (1) field duplicate and submitted for the laboratory analysis of BTEX and PHC F1-F4, PAHs and selected metals.
    - Barenco collected three (3) groundwater samples including one (1) field duplicate and submitted for the laboratory analysis of BTEX and PHC F1-F4 and lead.
    - Barenco reports that the groundwater depths were ranged from 3.77 mbgs to 5.06 mbgs.
    - Barenco selected the Ontario Ministry of the Environment (MOE) (O. Reg. 153/04) Table 3 full depth generic Site Condition Standards (SCS) for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
    - Barenco reports that all soil and groundwater sample results met the Table 3 SCS.
- "Tank Replacement Program – *1660 Merivale Road, Ottawa, Ontario"*, prepared by Barenco and dated December 23, 2011
    - Barenco monitored the replacement of underground storage tank (UST) at the above referenced property between October 24 and November 2, 2011. Barenco reports that ECS Engineering & Construction Limited (ECS) was retained by Imperial Oil to complete this work.
    - Barenco reports that approximately 870 litres of residual product were purged from the four (4) USTs prior to their removal by Triangle Pump Services and disposed at Veolia Environmental Services facility located in Ottawa, Ontario.
    - Barenco reports that ECS removed all USTs with capacities of one (1) with 45,000 L and rest three (3) with 25,000 L each between October 25 and 26, 2011.
    - Barenco reports that the soil from the pit that could be considered for reuse was stock piled onsite. However, approximately 627 tonnes of soil that was geotechnically unsuitable for reuse as backfill was disposed offsite at Waste Management in Carp, Ontario.
    - Barenco collected a total of sixteen (16) soil samples including two (2) field duplicates from the edges of the excavation and stock piles and submitted for the laboratory analysis of BTEX, PHC F1-F4 and Lead. In addition, Barenco analysed six (6) selected soil samples from the submitted samples for PAHs.
    - Barenco selected the Ontario Ministry of the Environment (MOE) (O. Reg. 153/04) Table 5 Stratified Site Condition Standards (SCS) for industrial/commercial/community property use in a non-potable groundwater condition with medium to fine textured soils as being applicable for use at this site.
    - Barenco reports that all soil sample results met the Table 5 SCS.

Based on the information provided, it is considered that the impacts identified at the site are not completely delineated. Therefore, please provide the action plan for the complete delineation of the impacts identified at the site.

If the additional work to fully delineate the impacts has already been completed, please provide a copy of the report to the TSSA. If the work has not been carried out, please provide a time line for the completion of this work to the TSSA by May 31, 2012.

If you have any further questions, please contact me directly. When contacting TSSA regarding this file, please refer to the Service Request Number listed above.

Yours truly,

Sridhar Sangaraju, P.Geo, PMP

THIS REPORT CONTAINS PROVISIONS LIMITING LIABILITY, THE SCOPE OF THE REPORT AND THIRD PARTY RELIANCE

SUMMARY SHEET
1660 MERIVALE ROAD, OTTAWA, ONTARIO

1. Site and Adjacent Land Conditions

Type of Facility	Operating Esso Gas Station
Date of Soil Sampling	August 23 and 24, 2011
Date of Ground Water Sampling	August 31, 2011
Number of Test Holes Drilled	5 (TH1 to TH5)
Number of Monitoring Wells Installed	5 (TH1 to TH5)
Type of OVM Meter	Eagle RKI
Adjacent Land Use (current)	North - Commercial South – Residential East – Community (High School) West - Residential
Aquifer Usage in 100 metre Radius	No

2. Site Soil Conditions

Soil Type	Maximum Depths (m)	Comments
Clayey/sandy silt till	3.4	Sand & gravel present up to 1.2 metres below grade. Limestone bedrock encountered at 2.7 metres below grade.

3. Ground Water

Depth (m)	Approximately 3 to 4 metres below grade
Inferred Ground Water Flow Direction	Southwesterly
Free Product Detected	No

4. Selected Soil and Ground Water Standards

Table 3 (industrial/commercial/community property use and fine and medium textured soils in a non-potable ground water condition)

5.Analytical Results (Samples exceeding applicable Regulation 153/04 standards)

Location	Medium	Depth (mbg)	Parameters
TH3/DUP1	Ground Water	N/A	F1, F2
TH4	Ground Water	N/A	B, E, X, H, F1, F2
TH5	Ground Water	N/A	B, E, X, H, F1, F2, F3, F4

1.0 INTRODUCTION

1.1 Terms of Reference

Barenco Inc. was retained by Imperial Oil to conduct a due diligence Phase II environmental assessment at a site located on the southwest corner of Merivale Road and Viewmount Drive in Ottawa, Ontario. For the purpose of this report, the term subject property refers to the site with the municipal address of 1660 Merivale Road, Ottawa.

The objective of this work was to gain an understanding of subsurface conditions at the subject property prior to an underground storage tank replacement program. The Phase II environmental assessment involved a soil and ground water sampling program. Parameters chosen for analysis during the Phase II investigation were based upon use of the subject property as an operating gas station.

A geotechnical investigation occurred concurrently with the Phase II environmental assessment. Barenco subcontracted the geotechnical component of the investigation to **exp.** Associates Inc. The geotechnical investigation will reported under a separate cover.

The environmental assessment standards for the site were determined using Ontario Regulation 153/04 under Part XV.1 of the *Environmental Protection Act*. Soil and ground water samples were properly collected, preserved, and submitted to Maxxam Analytics Inc., a SCC accredited laboratory. All work was carried out following the Quality Management, Control and Assurance procedures outlined in Appendix A.

Barenco performed the Phase II environmental assessment following the principles of the Canadian Standards Association Z769 Guideline and in accordance with generally accepted professional practices. Subject to this standard of care, Barenco makes no expressed or implied warranties regarding its services and no third party beneficiaries are intended. Limitation of liability, scope of report and third party reliance are outlined in Section 7.0 of this report.

2.0 SITE BACKGROUND

2.1 Site Description

The subject property is located on the southwest corner of Merivale Road and

Viewmount Drive in Ottawa, Ontario. A locality plan is provided as Figure 1.

The subject property is zoned for mid-rise mixed use AM5[195]H(34), according to the City of Ottawa Planning Department.

The subject property was occupied by an Esso Gas Station at the time of the investigation. A site plan is provided as Figure 2.

It is proposed that the underground storage tanks will be replaced on the subject property. A site plan showing the proposed features of the gas station was not available at the time of the current investigation. It is understood that the new tank nest will be in approximately the same location as the current tank nest.

The surrounding properties are being used for residential, commercial and institutional purposes. Single family residences are present to the west and south, shopping malls are present to the north and northeast, and Merivale High School is present to the east of the subject property.

2.2 Native Soils and Topography

The site is located in the physiographic region known as the Russell and Prescott Sand Plains. The surface soils are predominantly sand and sandy loams (*Physiography of Southern Ontario*, Chapman and Putnam, 1984).

The land surface slopes slightly downward slightly toward the north.

Three soil samples were collected during the current investigation and were submitted to **exp.** Associates Inc., a geotechnical engineering firm, for grain size analysis. One sample was collected from TH3 at a depth of 2.3 to 2.9 metres below grade, one sample was collected from TH4 at a depth of 1.5 to 2.1 metres below grade and one sample was collected from TH4 at a depth of 2.3 to 2.9 metres below grade. All three samples are representative of the native soil on the site and were composed of 48%, 72%, and 59% of particles that were smaller than 75 microns, respectively. Per Regulation 153/04, to be classified as coarse textured soil, at least 1/3 of the soil on site must contain 50% or more particles that are larger than 75 microns. Since two of the three samples contain more than 50% of particles that were smaller than 75 microns and the third sample has approximately 50% particles that were smaller than 75 microns, soil at the subject property should be classified as medium and fine textured. A copy of the grain size analysis is provided within the geotechnical report in Appendix B.

Although sand is predominant in the area, a sandy/clayey silt till was encountered at the subject property. Hydraulic conductivity of the silt till is

estimated at 10^{-5} centimetres per second based on typical values in this type of soil (*Groundwater*, Freeze and Cherry, 1979).

2.3 Ground Water and Municipal Services

The subject property is serviced by municipal water and storm and sanitary sewers. The City of Ottawa obtains its potable water from the Ottawa River.

The depth to the ground water table is approximately 3 to 4 metres below grade, based on measurements made in monitors. The regional ground water flow direction is estimated to be site southeast towards Tributary of the Rideau River.

Table 1 summarizes the environmental setting and site characteristics. Table 2 shows Darcy's Law calculations of the estimated ground water flow velocity at the site. The ground water flow velocity was estimated to be approximately 0.45 metres per year.

3.0 ASSESSMENT STANDARDS

3.1 Ontario Regulation 153/04

Ontario Regulation 153/04 under Part XV.1 of the *Environmental Protection Act* provides generic remediation standards based on land use (agricultural, residential/parkland/institutional, or industrial/commercial/community), ground water use (potable or non-potable), soil type (coarse or medium and fine textured), and restoration depth (full or stratified).

Regulation 153/04 also provides alternate methods for assessment and remediation based on either restoring soil and ground water to background conditions or the use of a risk assessment. Generic standards for both soil and ground water are outlined in a document entitled *Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act.*

3.2 Site Assessment Standards

The subject property is not considered to be potentially sensitive for the following reasons: there are no areas of natural or scientific interest on or immediately adjacent to the site according to the Ministry of Natural Resources Natural Heritage website; the pH of three soil samples collected during the current investigation were within the applicable ranges for surface and subsurface soils (as shown in Table 3); consolidated bedrock is not present at

depths of less than 2.0 metres on the site; and there are no surface water bodies within 30 metres of the site. Therefore, this site would not be considered potentially sensitive, and use of the generic standards is appropriate.

Based on the current use of the site as a gas station, as well as site environmental setting data shown in Table 1, the site would be classified as having commercial/ industrial/community property use with non-potable ground water. Ontario Regulation 153/04 (2011) Table 3 standards for commercial/ industrial/community property use and fine and medium textured soils are appropriate for evaluating conditions at this site.

4.0 SITE INVESTIGATION

4.1 Potential Contaminants of Concern

The objectives of the current investigation were to investigate potential sources of contamination to the subject property and to provide baseline environmental data prior to site redevelopment. Specifically, the following potential sources of contamination (with potential contaminants of concern in brackets) were identified:

- former handling of gasoline and diesel (BTEX, hexane, F1 to F4, 2 and 3 ring PAH, lead in soil; BTEX, hexane, F1 to F4, EDB, EDC, MTBE, lead in ground water)
- unknown nature of imported fill to site (BTEX, hexane, F1 to F4, metals, full suite PAH in soil)
- handling of waste oils, lubricants, solvents at the former service garage (BTEX, hexane, F1 to F4, arsenic, barium, chromium, copper, lead, zinc, full suite PAH, PCB in soil; BTEX, hexane, F1 to F4, EDB, EDC, MTBE, chlorinated VOC, lead in ground water)
- Current carwash on the subject property (BTEX, F1to F4, hexane, arsenic, barium, chromium, copper, lead, zinc, PAH in soil; BTEX, F1 to F4, hexane, EDB, EDC, MTBE, in ground water)

The locations of the test holes that were drilled to address these issues are shown on Figure 2.

4.2 Drilling Investigation

The drilling investigation was conducted on August 23 and 24, 2011. George Downing Estate Drilling Ltd. was contracted by Barenco to drill five test holes (TH1 to TH5). The test holes were drilled to the bedrock (a maximum depth of 3.4 metres below grade) using a CME 75 truck-mounted auger rig and a split

spoon sampler. All test holes were then cored to a maximum depth of 5.8 metres below grade.

Daylighting activities were performed to reduce the possibility that an unknown subsurface structure would be struck as drilling activities progressed. Barenco retained Green for Life Environmental Corporation Corp. (MOE Registration A680301) to provide the daylighting services. Green for Life also removed all of the drill cuttings from augering. Cuttings were disposed at GFL Environmental East Corp., a MOE licensed waste receiver (MOE Registration A680301).

Soil samples were collected from split spoon samplers as the drilling progressed. These samples were examined for geologic information and for physical evidence of chemical impact. Readings of the petroleum vapour concentrations in the soil samples collected during the drilling investigation were recorded using an Eagle RKI, where there was sufficient recovery. This instrument is designed to detect and measure concentrations of combustible gas in the atmosphere. It is equipped with two ranges of measurement, reading concentrations in parts per million vapour (ppmv) or in percentage lower explosive limit (LEL). The Gastechtor instrument can determine combustible vapour concentrations in the range equivalent to 0 to 11,000 ppmv of hexane. The 1238 ME was configured to eliminate any response from methane for all sampling conducted at the site. Instrument calibration is checked on a daily basis in both the ppmv range and LEL range using standard gases comprised of a known concentration of hexane in air. If the instrument readings are within ±10% of the standard gas value, then the instrument is deemed to be calibrated, however if the readings are greater than ±10% of the standard gas value then the instrument is re-calibrated prior to use.

During the drilling investigation, bedrock refusal was encountered between 2.7 and 3.4 metres below grade. As there was no evidence of the water table in the overburden material and no previous site data was available, coring was conducted to a maximum depth of 5.8 metres below grade.

Petroleum vapours ranged from non-detectable to 250 ppmv. The test hole logs are provided in Appendix C. A copy of the well record that was submitted to the MOE is also included in Appendix C.

All of the test holes (TH1 to TH5) were completed as subsurface monitors. The monitors are constructed of 50 millimetre diameter threaded PVC pipe. The lower section of pipe is slotted above and below the water table. The upper section of the pipe is solid. The lower part of the annulus of the hole is backfilled with clean sand up to approximately 0.3 metres above the top of the slotted section. A bentonite seal is placed above the sand to just below grade. Concrete is used to seal the monitors at grade. The monitor is equipped with a protective flushmount casing and locking lid.

4.3 Soil Disposal

One soil sample representative of the excess drill cuttings was submitted to the Mississauga facility of Maxxam Analytics Inc., a SCC accredited laboratory, for analysis of selected Ontario Regulation 558 parameters and ignitability. The soil sample was placed into sealed laboratory prepared glass jars, labelled, and transported to the laboratory stored in a cooler with ice at less than 10°C.

The results for the Regulation 558 analysis are provided in Table 4. The applicable Schedule 4 leachate criteria are also provided. The soil sample was within the leachate criteria for all of the substances that were analysed. It was also non-ignitable. Thus, soil removed from site during the tank replacement investigation can be removed as solid, non-hazardous waste at a MOE licensed waste disposal facility.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

4.4 Soil Chemical Analysis

A total of seven soil samples, including two field duplicate samples, were collected during this investigation and were submitted to the Mississauga facility of Maxxam Analytics Inc. for analysis of benzene, toluene, ethylbenzene, xylenes (BTEX), hexane, petroleum hydrocarbon fractions F1 to F4, 2 and 3 ring polycyclic aromatic hydrocarbons (PAH), and selected metals. A total of six soil samples, including one field duplicate sample, were collected and were submitted to Maxxam Analytics Inc. for analysis of the full suite of metals and PAH. Field blanks were also submitted for BTEX, hexane, and PAH. A trip blank was submitted for BTEX and hexane. The soil samples were placed into sealed laboratory prepared glass jars, labelled, and transported to the laboratory stored in a cooler with ice at less than 10°C.

The results of the soil chemical analysis for petroleum parameters are provided in Table 5. The applicable Regulation 153/04 (2011) Table 3 standards are also provided. All of the soil samples were within the applicable Table 3 standards for all of the petroleum parameters that were analysed. Soil analytical data for petroleum parameters are shown on Figure 4.

The results of the soil chemical analysis for PAH are provided in Table 6. The applicable Regulation 153/04 (2011) Table 3 standards are also provided. All of the soil samples were within the applicable Table 3 standards for all of the PAH that were analysed.

The results of the soil chemical analysis for inorganic parameters are provided in Table 7. The applicable Regulation 153/04 (2011) Table 3 standards are also provided. All of the soil samples were within the applicable Table 3 standards for all of the inorganic parameters that were analysed.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

4.5 Coring Water Chemical Analysis

One sample was collected from the water used for during the coring process and submitted to the Mississauga facility of Maxxam Analytics Inc. for chemical analysis of BTEX and petroleum hydrocarbon fractions F1 to F4. The coring water sample was placed into sealed laboratory prepared glass bottles and vials, labelled, and transported to the laboratory stored in a cooler with ice at less than 10°C.

The results of the coring water chemical analysis, along with the appropriate Regulation 153/04 (2011) Table 3 standards, are provided in Table 8. None of the parameters analysed were detected in the coring water.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

4.6 Ground Water Chemical Analysis

Following the conclusion of the drilling investigation, all five monitors were developed by purging three well volume equivalents.

A total of six ground water samples, one from each monitor and one field duplicate samples, were subsequently collected and submitted to the Mississauga facility of Maxxam Analytics Inc. for chemical analysis of selected volatile organic compounds (including BTEX), petroleum hydrocarbon fractions F1 to F4, and lead. A field blank and a trip blank were submitted for analysis of these parameters. All ground water samples were placed into sealed laboratory prepared glass bottles and vials, labelled, and transported to the laboratory stored in a cooler with ice at less than 10°C.

The results of the ground water chemical analysis, along with the appropriate Regulation 153/04 (2011) Table 3 standards, are provided in Table 9. All of the ground water samples were within the Table 3 standards for all of the parameters that were analysed except TH3/DUP1, TH4, and TH5 which exceeded for benzene, ethylbenzene, hexane, F1, F2, F3, and/or F4. Ground water analytical data for petroleum parameters are shown on Figure 5.

Copies of the laboratory Certificates of Analysis are provided in Appendix D.

4.7 Ground Water Monitoring and Surveying

The subsurface monitors were inspected for general physical condition, ground water depth, and petroleum vapour concentrations on August 30, 2011.

Petroleum vapour concentrations ranged from non-detectable to 8% LEL. No phase-separated product was observed. The depth to the ground water table ranged from 3.25 to 4.21 metres below grade.

The monitors were surveyed relative to a benchmark. The benchmark, which was assigned an elevation of 100.00 metres, was the north side of a manhole located on the west side of the kiosk. The monitoring and elevation data are provided in Table 9.

A ground water contour plan based on ground water elevations measured in the monitors on August 30, 2011 was prepared, as shown on Figure 6. Based on the data, the ground water flow direction appears to be southwesterly.

5.0 CURRENT SITE STATUS

During the Phase II environmental assessment, soil and ground water quality at the site was investigated. The results of soil and ground water sampling were compared to the Regulation 153/04 (2011) Table 3 standards for industrial/commercial/ community property use and fine and medium textured soil. Soil samples were analysed for petroleum hydrocarbons, metals, and polycyclic aromatic hydrocarbons. Ground water samples were analysed for volatile organic compounds, petroleum hydrocarbons and lead.

All of the soil and coring water samples were within the applicable Table 3 standards for all of the parameters that were analysed. All of the ground water samples were within the applicable Table 3 standards for all of the parameters that were analysed except TH3/DUP1, TH4, and TH5.

The ground water flow direction was estimated to be southwesterly at a rate of approximately 0.45 metres per year.

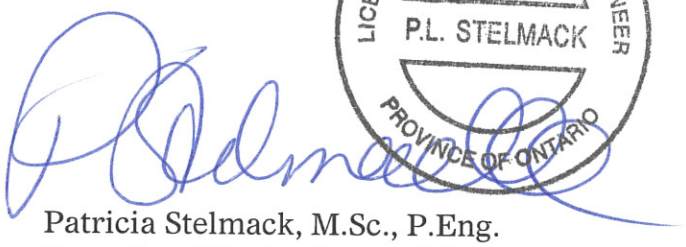
7.0 LIMITATION OF LIABILITY, SCOPE OF REPORT AND THIRD PARTY RELIANCE

This report has been prepared and the work referred to in this report has been undertaken by Barenco Inc. for Imperial Oil. It is intended for the sole and exclusive use of Imperial Oil, its affiliated companies and partners and the respective insurers, agents, employees and advisors (collectively, "Imperial Oil"). Any use, reliance on or decision made by any person other than Imperial Oil based on this report is the sole responsibility of such other person. Imperial Oil and Barenco Inc. make no representation or warranty to any other person with regard to this report and the work referred to in this report and they accept no duty of care to any other person or any liability or responsibility whatsoever for any losses, expenses, damages, fines, penalties, or other harm that may be suffered or incurred by any other person as a result of the use of, reliance on, any decision made or any action taken based on this report or the work referred to in this report.

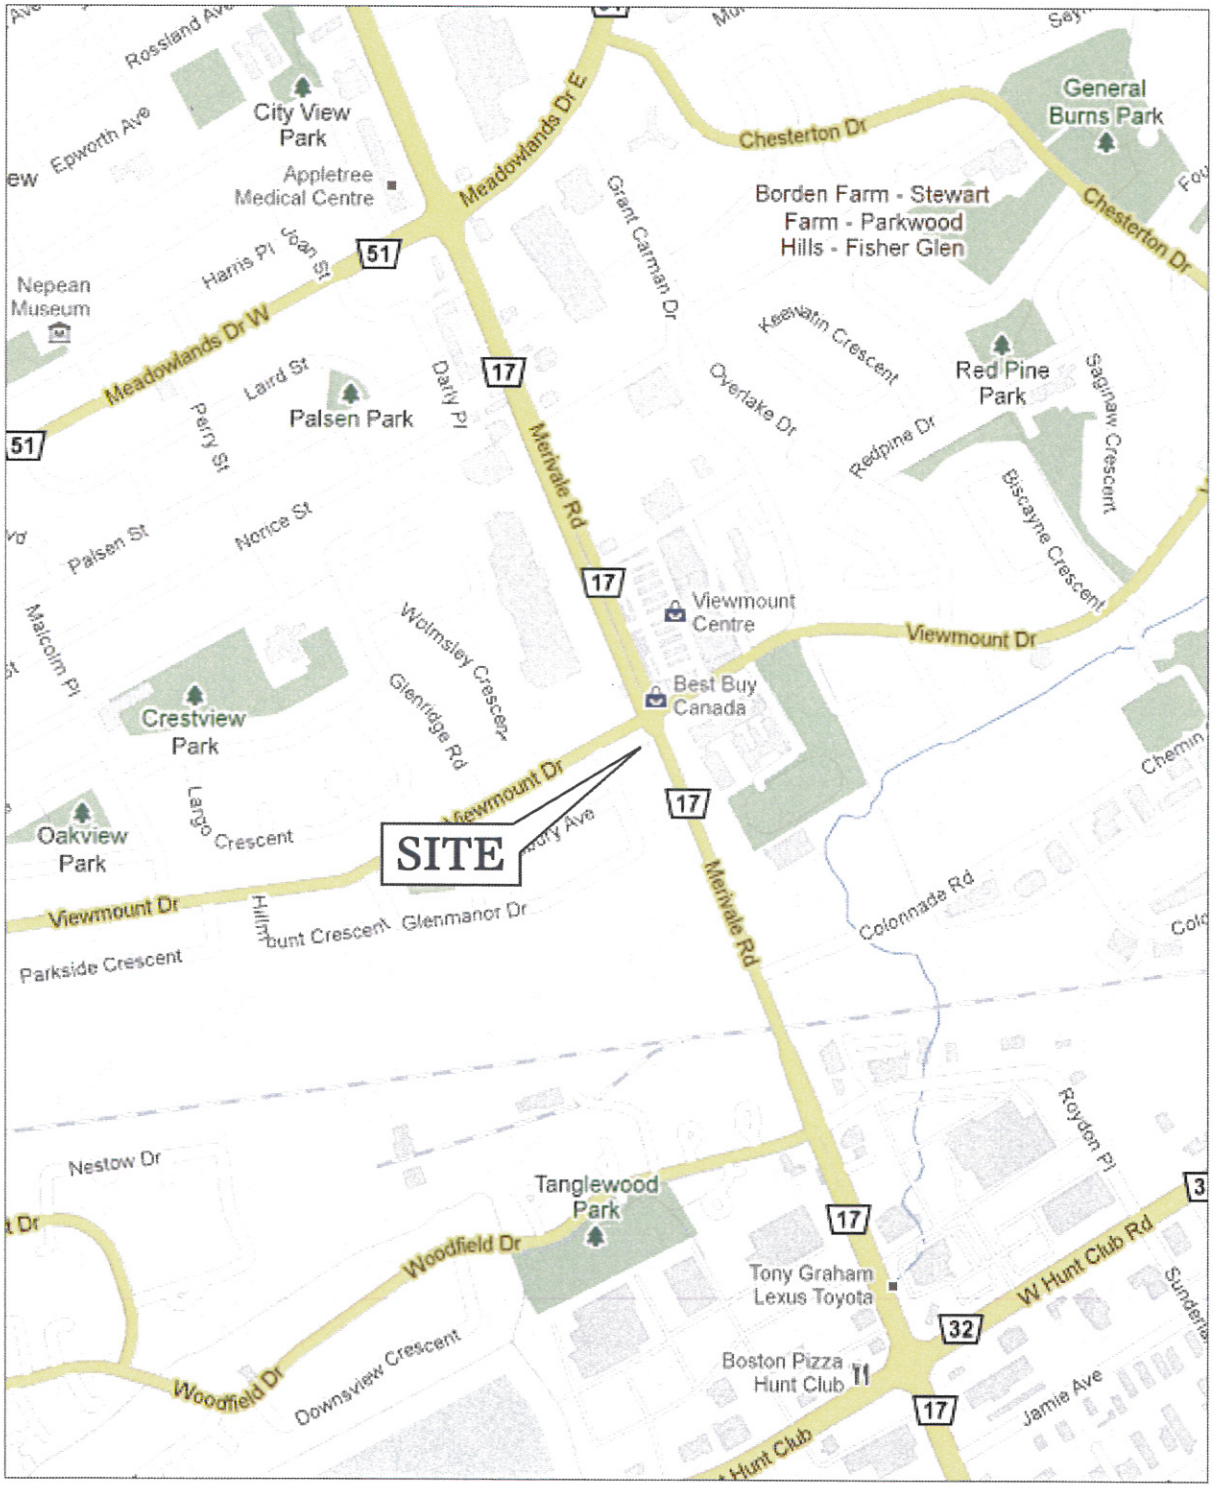


The investigation undertaken by Barenco Inc. with respect to this report and any conclusions or recommendations made in this report reflect Barenco Inc.'s judgement based on the site conditions observed at the time of the site inspection on the date(s) set out in this report and on information available at the time of preparation of this report. This report has been prepared for specific application to this site and it is based, in part, upon visual observation of the site, subsurface investigation at discrete locations and depths, and specific analysis of specific chemical parameters and materials during a specific time interval, all as described in this report. Unless otherwise stated, the findings cannot be extended to previous or future site conditions, portions of the site which were unavailable for direct investigation, subsurface locations which were not

investigated directly, or chemical parameters, materials or analysis which were not addressed. Substances other than those addressed by the investigation described in this report may exist within the site, substances addressed by the investigation may exist in areas of the site not investigated and concentrations of substances addressed which are different than those reported may exist in areas other than the locations from which the samples were taken.

If site conditions or applicable standards change or if any additional information becomes available at a future date, modifications to the findings, conclusions and recommendations in this report may be necessary.

Other than by Imperial Oil, copying or distribution of this report or the use of or reliance on the information contained herein, in whole or in part, is not permitted without the express written permission of Barenco Inc. Nothing in this report is intended to constitute or provide a legal opinion.



Respectfully submitted,
BARENCO INC.

TABLES

Table 1

SITE ENVIRONMENTAL SETTING DATA

1660 Merivale Road, Ottawa, Ontario

NATIVE SOIL AND BEDROCK

Type:	Silt Till
Hydraulic Conductivity (cm/s):	1.55×10^{-6} to 4.59×10^{-6}
Percent Sand:	Less than 50%
Depth to Bedrock:	Between 2.7 to 3.4 metres below grade
Bedrock Type:	Limestone

GROUND WATER

Depth to Water Table:	Approximately 3 to 4 metres below grade (in bedrock)
Estimated or Measured:	Measured
Direction of Flow:	Southwest
Estimated or Measured:	Measured

POTABLE WATER AND SEWERS

Potable Water Source:	Municipal
Municipal Water Source:	Surface Water (Ottawa River)
Distance to Nearest Municipal Water Well:	Not Applicable
Distance to Nearest Private Water Well:	Not Applicable
Sanitary Sewage System:	Municipal Sewer
Storm Water System:	Municipal Sewer

OTHER UTILITIES

Power:	Hydro Ottawa
Natural Gas:	Enbridge
Telephone:	Bell Canada
Other:	City of Ottawa (street lights, water and sewer)

SURFACE WATER

Name of Nearest Water Body:	Nepean Creek
Distance from Site:	Approximately 250 metres southeast
Elevation Drop from Site:	Unknown
Direct Drainage from site:	No

Table 2

DARCY'S LAW CALCULATIONS

1660 Merivale Road, Ottawa, Ontraio

August 2011

v=ki/n

Overburden

Permeability k (m/sec) =	1.00E-07
(cm/sec) =	1.00E-05
Gradient i (m/m) =	0.050
Porosity* n =	0.35

* (from Freeze & Cherry, 1979)

Velocity v (m/sec) =	1.43E-08
(feet/sec) =	4.69E-08
(feet/day) =	4.05E-03
(feet/year) =	1.48E+00
(metres/year) =	4.51E-01

Permeability for silt till

Gradient measured across site using monitors installed onsite.

nd means "not detected".

BARENCO INC.

APPENDIX A

Quality Management, Control and Assurance

BARENCO

QUALITY MANAGEMENT, CONTROL AND ASSURANCE

Project Quality Management

Sampling analysis was performed using generally accepted principles and with appropriate sampling equipment. Written field and laboratory sampling procedures for soil and ground water developed by Barenco Inc. were used to ensure consistency in sample collection and preparation of samples for submission to the laboratory. The MOE document entitled *Guidance on Sampling and Analytical Methods for Use at Contaminated Sites in Ontario*, December 1996, was used as a reference.

The staff involved in the field sampling have participated in regular, ongoing Barenco training programs and were qualified and experienced in collecting, describing, and preparing environmental samples for laboratory analysis.

Laboratory analysis was performed using generally accepted principles in accordance with the *Protocol for Analytical Methods Used in the Assessment of Properties* under Part XV.1 of the Environmental Protection Act (Protocol).

Data quality objectives for the parameters of concern were set to meet acceptable RDLs to achieve the goal of defining areas where such parameters are present at levels in excess of applicable generic standards, as defined in Ontario Regulation 153/04 as amended under the Environmental Protection Act, as amended by Regulation 511/09. This included providing written instruction to the participating analytical laboratory describing the required analyses on the Chain of Custody prepared and delivered with the samples. The laboratory has a standing contract with Imperial Oil which sets out specific data quality requirements. Any non-compliance with this contract is documented using a data quality waiver issued by the laboratory. When a data quality waiver is issued by the laboratory, it must be reviewed, signed by Barenco, and returned to the laboratory. Data quality waivers are included with all reports, along with the complete Certificate of Analysis.

Field Quality Assurance/ Quality Control

The soil and water sampling plan was prepared and executed based on professional judgment at the time of the investigation.

Field observations were made and documented in a field book in accordance with generally accepted practices and with the procedures developed and utilized by Barenco.

Barenco field sampling QA/QC protocols are tailored to the investigation and include, where appropriate:

- the collection of at least one duplicate sample per site for both soil and ground water (where three or more such samples are collected);

- where volatile organic chemical analysis is required, the collection of discrete samples directly into sample vials with teflon-lined lids with methanol preservative and immediate placement into a cooler with free ice to maintain the temperature at less than 10° C for transport to the laboratory;

- the use of dedicated equipment for ground water sampling at different monitors;

- where sampling for trace organics (organic chemicals with a criterion value of less than 1 ug/g and/or samples collected for determination of background trace organic concentrations), ensuring that neither the bare hand or latex glove comes into contact with the water as it is being placed into the laboratory sample container;

- the inclusion of one soil trip blank and field blank per site (where three or more samples are collected) for volatiles; the vials containing both the field blank and trip blank are prepared by the laboratory; the vials containing the field blank are opened in the field during the sample collection process; after sampling both the field blank and trip blank are kept in the cooler on ice and returned to the laboratory for analysis as part of the submission;

- the inclusion of one soil field blank per site for all organic chemicals in soil except hydrocarbon fractions; the jars containing the field blank are prepared in the field using silica during the sample collection process and returned to the laboratory for analysis;

- the inclusion of one water trip blank and field blank per site (where three or more samples are collected) for all chemicals in ground water except pH and electrical conductivity; the bottles containing the field blank are prepared in the field during the sample collection process and returned to the laboratory for analysis; the bottles containing the trip blank are prepared by the laboratory, kept in the cooler on ice for the duration of the sampling event, and returned to the laboratory for analysis as part of the submission.

The results of the duplicate, field blank and trip blank samples are presented along with the tabulated data in the report. Tabulated data are presented to a maximum of two significant digits.

Laboratory Quality Assurance/Quality Control

All laboratory analyses were completed by Maxxam Analytics Inc., a Standards Council of Canada (SCC) accredited laboratory, for these tests. Maxxam performed the work following formal written methods and procedures. These methods include all the minimum requirements as specified in the Protocol.

Barenco Inc. has accepted the data provided by Maxxam based on the assurance from Maxxam that as a minimum, the following requirements have been met and documentation to demonstrate compliance can be produced on request:

- the method performance criteria identified in the Protocol were met;
- sample storage requirements, pre-analysis processing techniques, and holding times for all sample types as identified in the Protocol were met following receipt and sign-off of the samples from Barenco staff;
- the results of all laboratory QC samples were within statistically determined control limits and if not, reasons were provided;
- surrogate recoveries (for organic analyses) were monitored and recorded;
- details on the precision and accuracy of the data have been recorded and retained and are available from the laboratory should they be required as a result of an MOE audit;
- the analytical data were reported without blank correction (unless the correction was clearly identified on the Certificate of Analysis);
- a Certificate of Analysis with all QA/QC sample data, including surrogate recoveries, has been received from the laboratory and is appended.

A data quality review checklist has been prepared by Barenco for each laboratory submission to ensure that data quality has been reviewed and that the effect of any anomalies has been considered. The checklist is appended with the Certificate of Analysis.

Laboratory QA/QC duplicate analyses are tabulated in the attached tables. For this phase of the project, the laboratory conducted 1 laboratory QA/QC duplicate

soil analyses of petroleum parameters, 2 laboratory QA/QC duplicate soil analyses of inorganic parameters, and 2 laboratory QA/QC duplicate ground water analyses of petroleum parameters.

Two soil field duplicate samples were collected and submitted for laboratory analysis of benzene, toluene, ethylbenzene, xylene (BTEX), hexane, and petroleum hydrocarbon fractions F1 to F4. Three soil field duplicate samples were collected and submitted for laboratory analysis of polycyclic aromatic hydrocarbons (PAHs) and select metals. The relative percent differences (RPDs) of the soil field duplicate samples are provided in this appendix. It should be noted that meaningful RPDs cannot be calculated if one or both of the analytical results are less than five times the reporting detection limits (RDLs). All of the RPDs were either within the alert limits for all of the parameters that were analysed or not calculable.

One field blank soil sample was submitted for laboratory analysis of PAH. One field blank and one trip blank soil sample were submitted for laboratory analysis of BTEX and hexane. The field blanks were prepared in the field following standard sampling protocols. The concentrations of all of the parameters that were analysed were within five times the RDLs.

One ground water field duplicate sample was collected and submitted for laboratory analysis of selected volatile organic compounds (VOC), petroleum hydrocarbon fractions F1 to F4, and lead. The relative percent differences (RPDs) of the ground water field duplicate sample are provided in this appendix. It should be noted that meaningful RPDs cannot be calculated if one or both of the analytical results are less than five times the reporting detection limits (RDLs). All of the RPDs were within the alert limits or not calculable for all of the parameters that were analyzed.

One field blank water sample was submitted for laboratory analysis of volatile organic compounds (VOC), petroleum hydrocarbon fractions F1 to F4, and lead. The field blank was prepared in the field following standard sampling protocols. The concentrations of all of the parameters that were analysed were not detectable.

One laboratory prepared trip blank water sample was submitted for laboratory analysis of volatile organic compounds (VOC), petroleum hydrocarbon fractions F1 to F4, and lead. The trip blank was prepared by the laboratory following standard protocols. The concentrations of all of the parameters that were analysed were not detectable.

Results of the field blank and trip blank analyses indicate that field sampling techniques, sample preservatives, sample bottles, sample transportation, or laboratory analysis of the samples contributed a negligible amount to the sample analytical results reported in the laboratory Certificates of Analysis, and to the interpretation of the results described in this report.

A summary of data quality waivers and other data issues is presented in the attached table.

DATA QUALITY WAIVERS AND OTHER LABORATORY DATA ISSUES

Maxxam Job #	DQW #	Matrix	Sample ID	Test Affected	Deviation	Interpretation
B1C8784	N/A	Soil	N/A	PAH	Naphthalene test is out of statistical control (4 out of 5 points are below 1 sigma); Phenanthrene test is out of statistical control (2 out of 3 points are below 2 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since all other laboratory QC samples were within the acceptance criteria.
B1C8803	N/A	Soil	N/A	PAH	Naphthalene test is out of statistical control (4 out of 5 points are below 1 sigma); Phenanthrene test is out of statistical control (2 out of 3 points are below 2 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since all other laboratory QC samples were within the acceptance criteria.
B1C8810	N/A	Soil	N/A	PAH	Metribuzin test is out of statistical control (4 out of 5 points are above 1 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since metribuzin was not identified as a parameter of concern in this investigation.
B1C9700	N/A	Soil	N/A	PAH	Naphthalene test is out of statistical control (4 out of 5 points are below 1 sigma); Phenanthrene test is out of statistical control (2 out of 3 points are below 2 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since all other laboratory QC samples were within the acceptance criteria.

DATA QUALITY WAIVERS AND OTHER LABORATORY DATA ISSUES						
Maxxam Job #	**DQW #**	**Matrix**	**Sample ID**	**Test Affected**	**Deviation**	**Interpretation**
B1C9706	N/A	Soil	TH4-4	PAH	D8-acenaphthylene extraction surrogate recovery for TH4-4 (49%) is below acceptance criteria (50 to 130%).	Possible low bias of data. Deviations should not have a material effect on conclusions presented in this report, since reported PAH parameters in these samples were less than the reporting detection limits.
			N/A	N/A	Chain of custody not completed by Maxxam (Samples have not been verified).	This issue would not affect the data represented in this report since the certificate of analysis has been signed off on.
B1D4694	N/A	Soil	N/A	Inorganics	Lead test is out of statistical control (2 out of 3 points are below 2 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since all other laboratory QC samples for inorganic parameters were within the acceptance criteria.
				BTEX/F1	Toluene test is out of statistical control (2 out of 3 points are below 2 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since all other laboratory QC samples for petroleum parameters were within the acceptance criteria.
B1D4730	N/A	Soil	N/A	BTEX/F1	Toluene test is out of statistical control (above 3 sigma).	Possible false positive indication of an issue. Deviations should not have a material effect on conclusions presented in this report, since all other laboratory QC samples were within the acceptance criteria.

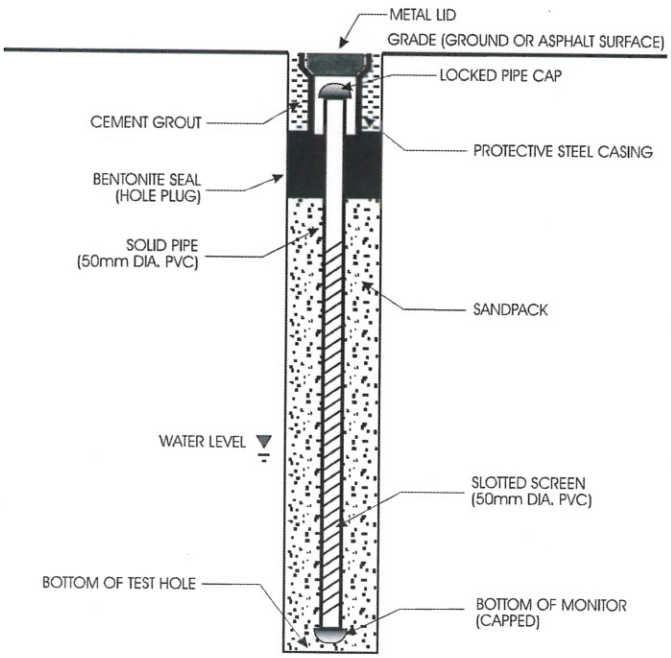
Test Hole Logs and MOE Well Record

BARENCO



LEGEND
BARENCO TEST HOLE LOGS
(TH1 to TH5)

STANDARD INFORMATION (applies to all test holes on this project, unless otherwise noted in the legend or log)

Project Site & Number:	Operating Esso Gas Station 1660 Merivale Road, Ottawa, Ontario Job #11010
Drilling Contractor:	George Downing Estate Drilling Ltd.
Test Hole Diameter:	216 mm
Monitor Details:	Casing Type = Flushmount Screen Type = 10 slot, 50 mm PVC Riser Type = 50 mm PVC No filter sock used. (see typical monitor legend for further details)
Dedicated Sampling Equipment:	HDPE Bailers
Site Benchmark:	Elevations are related to a temporary benchmark- the north side of a manhole cover located on the west side of the kiosk with assigned elevation = 100.00 metres (Barenco 2011)
Other Notes:	The attached test hole logs are part of the complete report and are to be used only in conjunction with the report. The data contained in the attached logs require interpretation by Barenco personnel.
Attached Graphical Legends:	Refer to Soil Symbol Identification Detail Refer to Typical Monitor Construction Detail

APPENDIX D

Laboratory Certificates of Analysis

Attached are copies of the original Certificates of Analysis provided by the laboratory. The data contained in these analyses is to be read only in conjunction with the report to which it is attached. For interpretation of the chemical data, see the attached text.

All samples are submitted to and reported by the laboratory using purchase order numbers and sample location codes. These are only discernible to persons familiar with the purchase order system and the location codes. For descriptions of the locations of the samples, see the attached text.

Not all data contained in the original laboratory certificate of analysis may have been referenced in the report. Samples may have been submitted as travel or field blanks or as duplicates. Some samples may be for control purposes and represent soil that is no longer on the site and is not relevant to the report.

Since the laboratory data contains scientific terms and references, only trained persons familiar with sampling and laboratory methods should attempt to interpret the raw data.

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

SQC trend rule failure for naphthalene, Batch 2593301. 4 of 5 consecutive points greater than 1SD below the mean. SQC trend rule failure for phenanthrene, Batch 2593301. 2 of 3 consecutive points greater than 2SD below the mean.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
SRM: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Barenco Inc.

Sampling Date: August 23, 2011

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics Inc.

Consultant Project Number: 11010

Sample Submission Number: B1C8784

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery			X	All laboratory QC samples are within the acceptance criteria.
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD			X	
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits.
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	No
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	not required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Package 1	2.3°C

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

SQC trend rule failure for naphthalene, Batch 2593301. 4 of 5 consecutive points greater than 1SD below the mean. SQC trend rule failure for phenanthrene, Batch 2593301. 2 of 3 consecutive points greater than 2SD below the mean.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
SRM: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) The recovery in the matrix spike was not calculated (NC). Spiked concentration was less than 2x that native to the sample.

Validation Signature Page

Maxxam Job #: B1C8803

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

BRAD NEWMAN, Scientific Specialist

FLOYD MAYEDE, Senior Analyst

MEDHAT RISKALLAH, Manager, Hydrocarbon Department

SUZANA POPOVIC, Supervisor, Hydrocarbons

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Consultant: Barenco Inc.

Sampling Date: August 23, 2011

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics Inc.

Consultant Project Number: 11010

Sample Submission Number: B1C8803

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC samples are within the acceptance criteria.
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits.
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	No
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as

per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
Leachate Blank: A blank matrix containing all reagents used in the leaching procedure. Used to determine any process contamination.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) The recovery in the matrix spike was not calculated (NC). Spiked concentration was less than 2x that native to the sample.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Barenco Inc.

Sampling Date: August 23, 2011

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics Inc.

Consultant Project Number: 11010

Sample Submission Number: B1C8810

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC samples are within the acceptance criteria.
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were submitted.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	No
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

PAH Compounds in Soil by GC/MS (SIM)	2	CAM SOP - 00318	EPA 8270

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Package 1	2.3°C

Each temperature is the average of up to three cooler temperatures taken at receipt

GENERAL COMMENTS

PAH Analysis: SQC trend rule failure for Phenanthrene, Batch 2594571. 2 of 3 consecutive points greater than 2SD below the mean.

PAH Analysis: SQC trend rule failure for Naphthalene, Batch 2594571. 4 of 5 consecutive points greater than 1SD below the mean.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
SRM: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was not sufficiently significant to permit a reliable recovery calculation.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.
(1) The recovery in the matrix spike was not calculated (NC). Spiked concentration was less than 2x that native to the sample.

Validation Signature Page

Maxxam Job #: B1C9700

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

BRAD NEWMAN, Scientific Specialist

CRISTINA CARRIERE, Scientific Services

YUAN ZHOU, gc\ms Technician

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Barenco Inc.

Sampling Date: August 24, 2011

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics Inc.

Consultant Project Number: 11010

Sample Submission Number: B1C9700

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

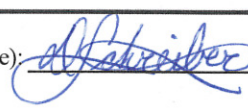
	Yes	No	NA	Comments
Instrument Surrogate Recovery			X	All laboratory QC samples are within the acceptance criteria.
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were submitted.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	No
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No



Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

RDL = Reportable Detection Limit
QC Batch = Quality Control Batch
(1) Surrogate recovery was below the lower control limit due to matrix interference. This may represent a low bias in some results.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
SRM: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Barenco Inc.

Sampling Date: August 24, 2011

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics Inc.

Consultant Project Number: 11010

Sample Submission Number: B1C9706

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			Extraction surrogate recovery for d8-acenaphthylene
Extraction Surrogate Recovery		X		for TH4-4, 49%, is below acceptance criteria
Method Blank Concentration	X			(50 to 130%).
Matrix Duplicate RPD	X			
Matrix Spike Recovery	X			
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	All field QC samples are within alert limits.
Trip Blank Concentration			X	
Field Duplicate RPD	X			

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	Yes
Is Chain of Custody completed and signed (Yes/No)?:	No
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B1C9946
Received: 2011/08/25, 08:30

Sample Matrix: Soil
Samples Received: 3

Analyses	Quantity	Laboratory Method	Method Primary reference
Petroleum Hydro. CCME F1 & BTEX in Soil	2	CAM SOP-00315	CCME CWS
Moisture	1	CAM SOP-00445	McKeague 2nd ed 1978
PAH Compounds in Soil by GC/MS (SIM)	1	CAM SOP - 00318	EPA 8270

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

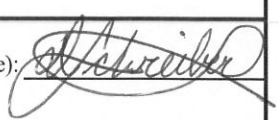
Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration	X			All field QC samples are within alert limits.
Trip Blank Concentration	X			
Field Duplicate RPD			X	



Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	not required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No

Date Issued: NA Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted within 24 hours unless otherwise flagged.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a reliable calculation.

DATA QUALITY REVIEW CHECKLIST - IMPERIAL OIL PROJECTS

Consultant: Barenco Inc.

Sampling Date: August 24, 2011

Location: 1660 Merivale Road, Ottawa

Laboratory : Maxxam Analytics Inc.

Consultant Project Number: 11010

Sample Submission Number: B1D1382

Are All Laboratory QC Samples Within Acceptance Criteria (Yes, No, Not Applicable)?

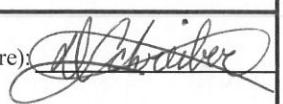
	Yes	No	NA	Comments
Instrument Surrogate Recovery	X			All laboratory QC samples are within the acceptance criteria.
Extraction Surrogate Recovery	X			
Method Blank Concentration	X			
Matrix Duplicate RPD	X			
Matrix Spike Recovery			X	
Lab Control Sample Recovery	X			

Are All Field QC Samples Within Alert Limits (Yes, No, Not Applicable)?

	Yes	No	NA	Comments
Field Blank Concentration			X	No field QC samples were submitted.
Trip Blank Concentration			X	
Field Duplicate RPD			X	

Has CoA been signed off (Yes/No)?:	Yes
Has lab warranted all tests were in statistical control in CoA (Yes/No)?:	Yes
Has lab warranted all tests were analyzed following SOP's in CoA (Yes/No)?:	Yes
Were all samples analyzed within hold times (Yes/No)?:	Yes
All volatiles samples methanol extracted (if required) within 48 hours (Yes/No)?:	not required
Is Chain of Custody completed and signed (Yes/No)?:	Yes
Were sample temperatures acceptable when they reached lab (Yes/No)?:	Yes

Was a Data Quality Waiver (DQW) issued (Yes/No)?: No



Date Issued: NA

Date of Response: NA

Is data considered to be reliable (Yes/No)?: Yes

If answer is "No", describe and provide rationale:

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted

GENERAL COMMENTS

Revised Report: As per client request additional parameters for VOC analysis reported in this C of A.

SQC trend rule failure for Pb, Batch 2603041. 2 of 3 consecutive points greater than 2SD below the mean.

SQC trend rule failure for Toluene, Batch 2603052. 2 of 3 consecutive points greater than 2SD below the mean.

VOC Analysis: Due to high concentrations of non-target analytes, some samples required dilution. Detection limits were adjusted accordingly.

The following bottles contained visual sediment, which was included in the analysis as per the Protocol for Analytical Methods Use in the Assessment of Properties under part XV.1 of the Environmental Protection Act.

For Samples TH1:
1 x 1L amber glass bottle for F4G contains <1 cm of sediment.
2 of 2 x 500mL amber glass bottles for F2-F4 contain <1 cm of sediment.
3 of 3 x 40mL clear glass vials for F1/BTEX contain <1 cm of sediment.
4 of 4 x 40mL clear glass vials for VOCs contain <1 cm of sediment.

For Samples TH2, TH3 and DUP1:
1 x 1L amber glass bottle for F4G contains <1 cm of sediment.
2 of 2 x 500mL amber glass bottles for F2-F4 contain <1 cm of sediment.
4 of 4 x 40mL clear glass vials for F1/BTEX contain <1 cm of sediment.
4 of 4 x 40mL clear glass vials for VOCs contain <1 cm of sediment.

For Sample TH4:
1 x 1L amber glass bottle for F4G contains 2.6 cm of sediment.
1st of 2 x 500mL amber glass bottle for F2-F4 contains 1.8 cm of sediment.
2nd of 2 x 500mL amber glass bottle for F2-F4 contains 2.0 cm of sediment.
1st of 4x 40mL clear glass vial for F1/BTEX contains 3.0 cm of sediment.
2nd of 4 x 40mL clear glass vial for F1/BTEX contains 3.2 cm of sediment.
2 of 4 x 40mL clear glass vials for F1/BTEX contain 3.1 cm of sediment.
1 of 4 x 40mL clear glass vial for VOCW contains 2.9 cm of sediment.
3 of 4 x 40mL clear glass vials for VOCW contain 3.0 cm of sediment.

For Sample TH5:
1 x 1L amber glass bottle for F4G contains 2.5 cm of sediment.
1st of 2 x 500mL amber glass bottle for F2-F4 contains 2.4 cm of sediment.
2nd of 2 x 500mL amber glass bottle for F2-F4 contains 2.5 cm of sediment.
1st of 4x 40mL clear glass vial for F1/BTEX contains 1.5 cm of sediment.
2nd of 4 x 40mL clear glass vial for F1/BTEX contains 1.5 cm of sediment.
3rd of 4 x 40mL clear glass vial for F1/BTEX contains 1.5 cm of sediment.
4th of 4 x 40mL clear glass vial for F1/BTEX contains 1.6 cm of sediment.
3 of 4 x 40mL clear glass vials for VOCW contain 1.2 cm of sediment.
1 of 4 x 40mL clear glass vial for VOCW contains 1.1 cm of sediment.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.
LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.
NC (RPD): The RPD was not calculated. The level of analyte detected in the parent sample and its duplicate was not sufficiently significant to permit a

Remarks:

Maxxam Analytics has performed all analytical testing herein in accordance with ISO 17025 and the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act. All methodologies comply with this document and are validated for use in the laboratory. The methods and techniques employed in this analysis conform to the performance criteria (detection limits, accuracy and precision) as outlined in the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act.

The CWS PHC methods employed by Maxxam conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following the 'Alberta Environment Draft Addenda to the CWS-PHC, Appendix 6, Validation of Alternate Methods'. Documentation is available upon request. Maxxam has made the following improvements to the CWS-PHC reference benchmark method: (i) Headspace for F1; and, (ii) Mechanical extraction for F2-F4. Note: F4G cannot be added to the C6 to C50 hydrocarbons.

Maxxam Analytics is accredited by SCC (Lab ID 97) for all specific parameters as required by GUCSO and O'Reg 153/04. Maxxam Analytics is limited in liability to the actual cost of analysis unless otherwise agreed in writing. There is no other warranty expressed or implied. Samples will be retained at Maxxam Analytics for three weeks from receipt of data or as per contract.

All data is in statistical control and has met all QC and method performance criteria unless otherwise flagged. All samples were analysed within hold time unless otherwise flagged. All soil samples for BTEX analysis were methanol extracted

GENERAL COMMENTS

Revised Report: As per client request additional parameters for VOC analysis reported in this C of A.

Sample KT3365-01: VOC Analysis: SQC out of statistical control failure for Toluene, Batch 2601477. Greater than 3 SD above the mean.

Sample KT3366-01: VOC Analysis: SQC out of statistical control failure for Toluene, Batch 2601477. Greater than 3 SD above the mean.

Results relate only to the items tested.

LCS: A blank matrix sample to which a known amount of the analyte has been added. Used to evaluate analyte recovery.
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.
Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Important Notice

When you have completed the work ordered by the inspector, **this original form must be returned to**:

Technical Standards and Safety Authority
4th Floor, West tower
3300 Bloor Street West
Toronto ON M8X 2X4

Telephone: (416) 325-9221
Fax: (416) 326-1662

Inspector's orders/instructions are issued under the authority of Ontario's **Energy Act** and **Gasoline Handling Act**. Anyone who fails to carry out an inspector's order/instruction is guilty of an offence. Conviction as an individual carries fines up to $25,000, or a prison term of up to one year, or both. Conviction as a corporation carries fines up to $100,000. **Gasoline Handling Act, 18 (1c & 2); Energy Act, 27 (D).**

You may appeal an inspector's order/instruction, but the order/instruction remains in effect during the appeal process. Appeals may be made to the Technical Standards and Safety Authority at the address shown above. **Gasoline Handling Act 15 (5); Energy Act 8 (8).**

The following instructions under Inspector's Report # E053093 have been complied with:

Fax: (416) 326-1662

Inspector's orders/instructions are issued under the authority of Ontario's **Energy Act** and **Gasoline Handling Act**. Anyone who fails to carry out an inspector's order/instruction is guilty of an offence. Conviction as an individual carries fines up to $25,000, or a prison term of up to one year, or both. Conviction as a corporation carries fines up to $100,000. **Gasoline Handling Act, 18 (1c & 2); Energy Act, 27 (D).**

You may appeal an inspector's order/instruction, but the order/instruction remains in effect during the appeal process. Appeals may be made to the Technical Standards and Safety Authority at the address shown above. **Gasoline Handling Act 15 (5); Energy Act 8 (8).**

The following instructions under Inspector's Report # E053093 have been complied with:

Dear Mr. Araji:

Re: 1660 Merivale Road, Ottawa
Receipt Number: *0032893*

This will acknowledge receipt of your letter of December 5th, 2014 and payment of $170.00, confirming the zoning provisions for a propane cylinder cage at the above-mentioned property.

We wish to advise that this property is presently subject to the provisions of the City of Ottawa Consolidated Zoning By-law 2008-250, as amended, in a zone designated as AM (Arterial Mainstreet).

A propane cylinder cage would be permitted in the above-mentioned zone provided that they also meet the provisions for the Handling and Transfer of Propane and Natural Gas (Section 66):

(1) *Facilities relating to the handling and transfer of propane and natural gas, including tanks and associated compressors, pumps and other similar facilities must not be located in any required front, side, corner side or rear yard, nor closer than 30 metres to any lot line abutting a residential zone.*

(2) *Despite subsection (1), the minimum of 30 metres may be reduced to a minimum of 6 metres where it can be demonstrated that appropriate noise abatement measures have been undertaken to ensure that noise levels at the boundary of the residential zone do not create a nuisance for uses in that abutting residential zone.*

Soil and Groundwater Quality Investigation
1660 Merivale Road, Ottawa, Ontario (CTP 1126 – Merivale)

Dear Tara,

1. Introduction

On behalf of Canadian Tire Corporation (CTC), GHD completed a soil and groundwater quality investigation for the property known as CTP 1126 Merivale, located at 1660 Merivale Road in Ottawa, Ontario (hereafter referred to as Site or Property). A Site location map is presented as **Figure 1**, and a Site plan is presented on **Figure 2**.

It is GHD's understanding that the Site is currently owned by Harnois Energies (who recently purchased the Site from Imperial Oil Limited) and operates under a rebranding agreement with Canadian Tire. GHD understands that CTC's lease commenced on November 19, 2012, and expires in 2022.

The primary objective of the soil and groundwater quality investigation was to confirm Site conditions relative to the baseline conditions established by others prior to the commencement of the lease.

The environmental investigative activities undertaken were limited to the Site only (i.e., vicinity of the Canadian Tire retail gas bar).

2. Background

The Site is approximately 0.66 hectares (1.63 acres) in size and is currently used as a retail service station. Based on a review of the historical Site documentation provided by CTC (listed in **Attachment A**), the following presents a summary of the pertinent Site information:

– The Site was purchased by Imperial Oil in 1956 and first developed as a retail service station and automotive garage in approximately 1968. Properties surrounding the Site are generally used for residential, commercial, and institutional purposes.

- Various environmental investigations have been undertaken by others (Barenco (now exp) and more recently Golder Associates) on behalf of Imperial Oil to investigate conditions on Site and off Site.
- Baseline conditions were established on Site in 2011 by Barenco. At the time of a Phase I Environmental Site Assessment (ESA) completed in 2011, the Site was improved with a retail service station including a pump island, kiosk, a canopy, a car wash facility and four (4) underground storage tanks (USTs). The car wash facility was built circa 1980. The current and historical use of the Site for a retail service centre and service garage, potential importation of fill of unknown quality to the Site during the construction of the car wash, and the replacement/decommissioning of the previous service station and service garage were identified as potential areas of environmental concern for the Site. It is noted that the Site no longer has a service garage.
- Stratigraphy at the Site generally consists of sand and gravel fill to 1.2 metres below ground surface (mBGS), underlain by limestone bedrock, which was encountered at a depth ranging from 2.7 and 3.4 mBGS.
- The on-site monitoring wells are typically screened from 3 to 6 mBGS, generally in the bedrock. Groundwater has generally been found to range between 3 and 4 mBGS, within the bedrock. Groundwater flow direction has been found to be in a southwesterly direction.
- Two different configurations of USTs and pump islands have been operated at the Site from 1968 to 1987, and 1987 to present. A service garage was located on the Site from approximately 1968 to 1984. The locations of current and historic infrastructure are presented on **Figure 2**.
- In 2011, three (3) 25,000-litre and one (1) 45,600-litre fiberglass USTs were removed. Associated product piping and dispensers were not removed. Vapour readings in the vicinity of the USTs ranged from non-detectable to 5% of the lower explosion limit (LEL). Approximately 627 tonnes of soil were disposed off-Site, reportedly for geotechnical reasons. Sixteen confirmatory soil samples were collected from the excavations and analyzed for petroleum hydrocarbons (PHCs), BTEX[1], and lead. Seven soil samples were submitted for analysis of select polycyclic aromatic hydrocarbons (PAHs). All of the samples collected from the sidewalls of the excavation were below the 2011 Ministry of the Environment (MOE) Table 5 stratified standards[2]. Confirmatory samples were not collected from some sidewalls or the base of the excavation due to the presence of peastone or bedrock. The existing USTs were reportedly installed within the tank excavation of the former USTs.
- Several soil and groundwater investigations have been completed at the Site, primarily on-Site from 2011 to present, and off-Site from 2012 to present, consisting of the following investigative locations as shown on **Figure 2**:
  - Nine (9) on-Site monitoring wells (TH1 to TH7 and MW15-01 and MW15-02).
  - Nine (9) off-Site monitoring wells (TH8 to TH12[3], TH100 to TH103, and MW16-01).
- All analyzed soil parameters had concentrations below the 2011 MOE Table 3 and Table 5 stratified standards.
- Groundwater impacts were identified on Site and off Site. In 2015, a Contaminant Management Plan (CMP) was prepared by exp on behalf of Imperial Oil to address subsurface petroleum hydrocarbon impacts on Site. The CMP included monitoring of on-Site wells (TH1 to TH7) and off-Site monitors (TH8, TH9, TH10 (MW16-01), TH11, TH12) and sampling for BTEX, PHCs, and lead on an annual basis. The CMP indicated that up to three additional test holes (TH100 to TH102) were planned to be installed to further delineate off Site groundwater impacts to the north (upgradient) and east (cross-gradient) of the

[1] Benzene, Toluene, Ethylbenzene, and Xylenes

[2] Ministry of the Environment and Climate Change, "*Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act",* dated April 15, 2011.

[3] Off-Site monitoring well TH10 was destroyed and subsequently decommissioned in 2016. MW16-01 was reinstalled in the location of TH10.

Site. Up to two additional test holes were planned to be installed on the Site, south of TH7 (downgradient) to further delineate the on-Site impacts (MW15-01 and MW15-02).

- Based on a Technical Standards and Safety Authority (TSSA) report, in 2021, Golder completed a soil vapour and groundwater sampling event. Samples were collected from fifteen (15) on-Site and off-Site monitoring wells (TH2, TH3, TH5, TH6, TH7, TH8, TH9, TH11, TH12, TH100, TH101, TH102, MW15-01, MW15-02, MW16-01) and submitted for laboratory analysis of BTEX, PHCs, and lead. Groundwater impacts were identified on Site and off Site. The Golder report was not provided to GHD for review.
- Golder also completed an additional subsurface investigation program in November/December 2021. Two (2) monitoring wells (MW21-01 and MW21-02) were installed west of TH1 to a maximum depth of approximately 6.2 mBGS and three (3) soil vapour probes (SV21-01 to SV21-03) were installed at the west, east, and south of Site boundaries. However, the results of any sampling activities and Site plan were not provided.
- Current and/or historical groundwater exceedances at the Site above the 2011 MOE Table 3 generic standards are summarized below:
  - TH3 (On-Site) – PHC F1 and PHC F2
  - TH4 (On-Site) – Benzene, Ethylbenzene, Xylenes, Hexane, PHC F1 and PHC F2
  - TH5 (On-Site) – Benzene, Ethylbenzene, Xylenes, Hexane, and PHC F1 to F4 fractions, lead
  - TH7 (On-Site) – PHC F1 and PHC F2
  - MW15-02 (On-Site) – PHC F1 and PHC F2
  - TH8 (Off-Site) – PHC F3 and PHC F4
  - TH9 (Off-Site) – Benzene, PHC F1, PHC F2, and PHC F3.
  - TH10 (Off-Site) (now destroyed/decommissioned) – PHC F1 and PHC F2
  - MW16-01 (Off-Site – replacement for TH10) – PHC F1 to F4 fractions
  - TH11 (Off-Site) – PHC F1, PHC F2, and hexane
  - TH12 (Off-Site) – PHC F1, PHC F2, and hexane
  - TH100 (Off-Site) – PHC F3 and PHC F4
  - TH101 (Off-Site) – PHC F1, PHC F2, and hexane
  - TH102 (Off-Site) – PHC F2
- A Screening Level Risk Assessment (SLRA) was undertaken to evaluate the potential risks posed by the groundwater impacts present within the municipal right-of-way to the east of the Site (Merivale Road). Based on the findings of the SLRA, the impacts present were not considered to represent a risk to human health.
- In 2017, the CMP was updated to include sampling of off-Site wells MW16-01, TH8, TH9, TH11, TH12, TH100 to TH102 for PHCs, BTEX and lead on an annual basis. The CMP indicated that the off-Site groundwater impacts at TH8, MW16-01 and TH100 have been delineated to the north and northeast. Off-Site impacts at TH9, TH11, TH12, TH101 and TH102 were evaluated as part of the SLRA and the petroleum related parameters exceeding the applicable 2011 MOE Table 3 generic standards were considered to not pose a risk to human receptors. Due to the direction of groundwater flow toward the property at 1660 Merivale Road, the exceedances noted in the right-of-way were considered upgradient/cross gradient from the property and no further investigation of these exceedances was proposed.
- Figures summarizing the investigative locations by others and the analytical results (where available up to 2016) have been provided in **Attachment A** for reference.

– The analytical results for CMP monitoring between 2018 and present have not been made available to CTC at this time, however a letter from the TSSA dated April 11, 2022, provided information regarding sampling undertaken in 2021. A summary of the salient findings is provided below.
    - Groundwater sampling was completed at both on and off-site monitoring wells by Golder on July 13 and 14, 2021.
    - Less than 1 millimetre of LPH was observed in monitoring wells TH1 and TH4.
    - PHC F1- F4 impact to groundwater was identified at on-Site monitoring wells TH3 and TH5 and several off Site wells. TH1 and TH4 were not sampled.
– Based on a review of the on-Site analytical results between 2011 and 2016 (refer to **Attachment A**), the concentrations of petroleum related parameters have generally been decreasing or fluctuating over time at locations where impacts have been identified between 2011 and 2016.

In summary, based on a review the historical soil and groundwater analytical results, impacts have been identified at the following locations:

Location	Soil	Groundwater
MW15-02	None	PHC F1 (2015 – 2016) PHC F2 (2015 – 2016)
TH1	None	PHC F4 (2016)
TH3	None	PHC F1 (2011 – 2013) PHC F2 (2011 – 2021)
TH4	None	PHC F1 (2011 – 2016) PHC F2 (2011 – 2016) Benzene (2011, 2014) Ethylbenzene (2011) Xylenes (2011 – 2013) n-Hexane (2011)
TH5	None	PHC F1 (2011 – 2021) PHC F2 (2011 – 2021) PHC F3 (2011 – 2013, 2016, 2021) PHC F4 (2011 – 2013, 2016, 2021) Benzene (2011 - 2014) Ethylbenzene (2011) Xylenes (2011) n-Hexane (2011) Lead (2021)
TH7	None	PHC F1 (2014 – 2015) PHC F2 (2013 – 2015)
TH8 (off site)	None	PHC F3 (2021) PHC F4 (2021)
TH9 (off site)		PHC F1 (2014 – 2017) PHC F2 (2014 – 2017) PHC F3 (2014, 2021) PHC F4 (2021)
TH10 (off site)	None	PHC F1 (2013) PHC F2 (2013)

Location	Soil	Groundwater
TH11 (off site)	None	PHC F1 (2013 – 2016) PHC F2 (2013 – 2016, 2021) PHC F3 (2015 – 2016, 2021) PHC F4 (2015 – 2016, 2021)
TH12 (off site)	None	PHC F1 (2013 – 2017, 2021) PHC F2 (2013 – 2017, 2021) PHC F3 (2015 – 2017) PHC F4 (2016)
TH100 (off site)	None	PHC F3 (2021) PHC F4 (2021)
TH101 (off site)	None	PHC F1 (2014 – 2017, 2021) PHC F2 (2014 – 2017, 2021)
TH102 (off site)	None	PHC F1 (2015, 2017) PHC F2 (2014 – 2017)
MW16-01 (off site)	None	PHC F1 (2017) PHC F2 (2017) PHC F3 (2021[4]) PHC F4 (2021)

The historical investigative locations are presented on **Figure 2** and the historical analytical results are summarized on figures presented in **Attachment A**.

3. Scope of Work

The following provides an overview of the scope of work completed by GHD:

– Development of a Site-specific Health and Safety Plan (HASP).
– Completion of a well inventory at the Site to determine the condition of the existing monitoring wells[5].
– Collection of static groundwater level measurements from the existing monitoring wells.
– Sampling of seven (7) existing groundwater monitoring wells on Site (TH2 to TH7, and MW15-02).
– Completion of public and private utility locates.
– Oversight of the advancement of seven (7) boreholes (BH1-22 to BH7-22), one of which was instrumented as a monitoring well (BH1-22/MW1-22).
– Soil screening and collection of soil samples for laboratory analysis of the contaminants of potential concern (PHCs and BTEX).
– Collection of one (1) groundwater sample from newly installed BH1-22/MW1-22.

Details of the above noted activities carried out by GHD are provided in the following sections.

[4] Analytical data is not available for 2021. Reported above MOE Table 3 standards in a TSSA letter dated April 11, 2022.
[5] During GHD's monitoring well inventory TH1 was found to be damaged and could not be measured or sampled. MW15-01 could not be found.

4. Field Activities

4.1 Preparation

Prior to initiating on-Site activities, GHD completed the following:

– Prepared a Site-specific Health and Safety Plan (HASP) for use during field activities. The HASP identified potential physical and chemical hazards, personal protective equipment to be used, and health and safety monitoring requirements. The HASP also identified local and project-specific contacts, including the local hospital, in case of emergency.

– Prior to groundwater monitoring and sampling, GHD completed a well inventory at the Site on June 14, 2022 to determine the condition of the existing monitoring wells and determine if they were suitable for sample collection. The findings of the well inventory are presented in Section 4.2. GHD also reviewed Site conditions, drill rig access, etc. in preparation for the drilling activities.

– Prior to initiating drilling activities, all applicable utility companies (gas, telephone, hydro, water, and sewers) were contacted to demarcate the locations of their respective underground utilities. GHD also arranged for a private utility locating contractor (USL-1) to demarcate any on-Site utilities within the proposed work area on June 23, 2022. The utility locates package (public and private) is provided in **Attachment B**.

4.2 Groundwater Monitoring & Sampling

Based on the findings of the monitoring well inventory, existing monitoring wells TH2 to TH7 and MW15-02 were found in good condition and were considered suitable for sample collection. TH1 had a damaged screen and MW15-01 could not be found and therefore samples could not be collected from these wells.

The groundwater level measurements of the existing monitoring wells were collected using a calibrated oil/water interface probe on June 15, 2022. The groundwater table ranged in depth from 2.01 mBTOR at TH3 to 4.45 mBTOR at TH5. The top of riser elevation of each of the existing monitoring wells was surveyed for vertical control with respect to a storm sewer catch basin (located northwest of the car wash was used as a benchmark), with an assumed elevation of 100 metres above Site datum (mASD). The top of riser reference elevations, as well as the groundwater level measurements are presented on **Table 1**. Groundwater elevation contours for June 15, 2022, are presented on **Figure 3**. Based on the groundwater contours, groundwater flow across the Site is generally in a southerly direction.

Groundwater sampling of the existing on-Site wells was completed on June 15 and 16, 2022. A groundwater sample was collected from the newly installed monitoring well (BH1-22/MW1-22) on July 7, 2022. Samples were collected in accordance with the following protocol:

– The monitoring wells were purged and sampled using low-flow techniques. Field measurements of pH, temperature, conductivity, turbidity, oxidation reduction potential (ORP), and dissolved oxygen (DO) were collected to ensure chemical equilibrium had been achieved. Purging continued until field parameters stabilized and consistent readings were obtained and/or the well went dry. A summary of the field parameters measured during groundwater purging are presented in **Table 2**.

– Groundwater samples were placed into laboratory-supplied containers specific to the analytical parameters, labelled and transported in a cooler containing ice to a Standards Council of Canada certified laboratory (Bureau Veritas) for analysis of one or more of the following parameters: petroleum hydrocarbons (PHC) fractions F_1 to F_4 and benzene, toluene, ethylbenzene and xylenes (BTEX).

A Quality Assurance/Quality Control (QA/QC) program was implemented to ensure quality data was generated. In general, one QA/QC sample was submitted for analysis for every ten samples collected. The groundwater

QA/QC program included the collection/submission of one (1) groundwater trip blank and one (1) field duplicate groundwater sample. A sample identification key is presented in **Table 3**.

Purge waters were temporarily containerized in a 205-litre PVC drum in a designated storage area on Site. Arrangements are being made for off-Site disposal in the near future.

4.3 Borehole Advancement & Monitoring Well Installation

On June 28, 2022, seven (7) boreholes (BH1-22/MW1-22 to BH7-22) were advanced on Site by a Ministry of the Environment, Conservation and Parks (MECP) licensed well contractor (Strata Drilling Group) retained by GHD. The locations of the boreholes were selected to generally coincide with those established during the 2011 baseline investigation and subsequent groundwater monitoring locations (TH1 to TH7). The investigative locations are presented on **Figure 2**

The boreholes were advanced using a track mounted Geoprobe 7822DT drilling rig equipped with direct push samplers. The boreholes were advanced to a maximum depth of 3.66 mBGS with exception to BH1-22/MW1-22 which was advanced to a depth of 5.49 mBGS to facilitate the installation of a monitoring well.

Borehole BH1-22 was instrumented as a monitoring well with a 50 millimetre (mm) diameter, 1.52-metre long, No. 10 slot, Schedule 40 polyvinyl chloride (PVC) screen and completed with a PVC riser pipe and expandable cap. The monitoring well was screened in the bedrock between 4.11 to 5.64 mBGS. A silica sand pack was placed in the annular space between the PVC screen/riser pipe and the borehole to approximately 0.3 metres above the top of the well screen. A bentonite seal was installed in the remaining borehole annulus above the sand pack. A protective flushmount casing with a concrete collar was placed around each well upon completion. The monitoring well completion details are presented in **Table 4**. The remaining boreholes were backfilled with bentonite chips up to the surface and finished with concrete and/or cold patch at ground surface. The stratigraphy and instrumentation logs, along with the MECP well record are provided in **Attachment C**.

All soil cuttings generated during the drilling activities were temporarily containerized in 205-litre drums in a designated storage area on Site for future disposal.

4.4 Soil Screening and Sampling

Soil samples were collected from the drilled borehole using the direct push method and dual tube liners. In general, soil samples were collected continuously to the termination depth of the boreholes in 0.6 metres intervals. All sampling equipment was decontaminated using Alconox cleaning solution and a deionized water spray between each sample location and depth.

Soil samples collected from the boreholes were logged in the field detailing geologic conditions encountered, soil classification, stratigraphy, and relative moisture content. Soil samples were also screened in the field for evidence of impact based on visual and olfactory observations as well as undifferentiated volatile organic compound (VOC) vapour readings, as measured by a calibrated photoionization detector (PID). The PID readings as well as the logged soil information are summarized on the stratigraphic and instrumentation logs provided in **Attachment D**.

One or more soil samples were collected from each borehole location for laboratory analysis. Soil samples were generally submitted from the depths similar to those of the 2011 baseline investigation. Soil samples selected for chemical analysis were placed into laboratory-supplied containers specific to the analytical parameters, labelled and transported in a cooler containing ice to a Standards Council of Canada certified laboratory (Bureau Veritas) for analysis of one or more of the following parameters: PHC fractions F_1 to F_4 and BTEX. One composite soil sample was collected from the drill soil cuttings for Toxicity Characteristic Leaching Procedure (TCLP) analysis of VOCs, metals and benzo(a)pyrene for waste characterization.

The soil QA/QC program included the collection/submission of one (1) field duplicate soil sample. The field duplicate sample was one of two samples taken from the same media (i.e., soil) at the same location and time

following the same sampling procedures. The field duplicate sample was used to validate field sampling protocol and laboratory analysis procedures. A sample identification key is presented in **Table 3**.

5. Physical Conditions

5.1 Geology

Boreholes were advanced to a maximum depth of approximately 3.66 mBGS with exception to BH1-22/MW1-22 which was advanced to a depth of 5.49 mBGS. The following subsurface materials and geologic deposits were encountered during the environmental investigation (from ground surface):

- **Pavement and Granular Base** – Surficial pavement was observed at BH1-22/MW1-22 to BH5-22 investigative locations, with a thickness of approximately 100 millimetres (mm). A granular base consisting of crushed gravel and sand was encountered underlying the pavement, with a thickness varying between approximately 230 mm and 910 mm.
- **Fill** – Fill materials were encountered below the granular at all of the investigative locations except BH4-22, extending to depths ranging from approximately 0.91 mBGS to 3.05 mBGS. The fill materials were found to consist of sand, gravel, or silty clay. Silty clay was encountered at BH6-22 from ground surface to top of bedrock (3.35 mBGS).
- **Native Silt/Clay/Sand** – Native deposits of silt, clay, or sand were encountered underlying the fill materials extending to the top of bedrock (2.29 to 3.35 mBGS). The native soils were brown to grey. At BH7-22 native silty clay extended from surface to top of bedrock (2.29 mBGS).
- **Bedrock –** Limestone bedrock was encountered underlying the overburden at surface depths ranging from 2.29 mBGS to 3.35 mBGS. BH1-22/MW1-22 was terminated in the bedrock at a depth of 5.64 mBGS.

Detailed descriptions of the geologic deposits encountered at each borehole location are presented on the stratigraphic logs provided in **Attachment D**.

5.2 Field Screening

As mentioned above, soil samples were screened in the field for evidence of impact based on visual and olfactory observations as well as undifferentiated VOC vapour readings, as measured by a calibrated PID. The highest PID reading was 1.5 parts per million (ppm) measured at borehole BH5-22 (between 2.4 to 3.0 mBGS). No petroleum hydrocarbon odours were noted at any of the borehole locations during drilling activities. The PID readings are provided on the stratigraphic and instrumentation logs provided in **Attachment C**.

During groundwater sampling, a strong petroleum hydrocarbon odour and visible sheen were noted at monitoring wells TH4 and TH5. Measurable LNAPL was not encountered.

6. Analytical Results

6.1 Regulatory Standard

The soil and groundwater analytical results were assessed to the generic standards provided in the MECP document entitled, "Soil, Ground Water and Sediment Standards for Use Under Part XV.1 of the Environmental Protection Act", dated April 15, 2011, for a non-potable groundwater condition (Table 3) for an industrial/commercial/community property use and medium to fine textured soils. The standards selected are

consistent with the assessment standards applied during the previous subsurface investigations undertaken on Site by others.

6.2 Quality Assurance/Quality Control

GHD collected field duplicate samples and submitted a trip-blank sample for laboratory analysis. BV completed an independent QA/QC program as part of the laboratory submissions. BV's QA/AC program consisted of laboratory duplicates, a matrix quality control spike, a spiked quality control blank, a method quality control blank, and reporting of surrogate percent recoveries.

Based on a review of the analytical results for GHD's QA/QC samples and the results presented in Section 6.3 and 6.4, the analytical data is considered acceptable for use.

6.3 Soil Analytical Results

The soil analytical results are presented in **Table 5** and the laboratory certificates of analysis are provided in **Attachment E**. Based on the soil analytical results, all analyzed PHC and BTEX parameters had concentrations below the MOE Table 3 standards.

A representative soil sample was collected during the drilling activities for TCLP analysis to characterize the soils for off-Site disposal at a MECP-approved waste disposal facility. The results of the TCLP analysis indicate that the soils would be classified as non-hazardous solid waste if disposed of off-Site at a MECP-approved waste disposal facility. The TCLP analytical results are provided in **Table 6** and the laboratory certificate of analysis is provided in **Attachment D.**

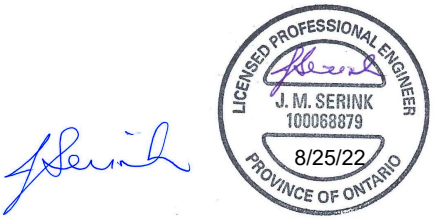
Based on the results of this investigation, there is no evidence that the soil conditions are substantially different than the 2011 baseline conditions with respect to the contaminants of concern (PHCs/BTEX).

6.4 Groundwater Analytical Results

The groundwater analytical results are presented in **Table 7** and **Figure 4** and the laboratory certificates of analysis are provided in **Attachment D**.

Based on the groundwater analytical results, all analyzed parameters were detected below the 2011 MOE Table 3 standards for medium to fine textured soils with the exception of PHC F_1, PHC F_2, and/or total xylenes at TH4 and TH5. TH4 and TH5 are located to the east and south of the existing pump island. Impacts to groundwater were previously identified at TH4 and TH5 in the 2011 baseline investigation and subsequent sampling events on one or more occasion.

There is no evidence that the groundwater conditions on-Site are substantially different than the baseline conditions established in 2011 and subsequent sampling events undertaken by others with respect to the contaminants of concern (PHCs/BTEX). The available historical results are presented in **Attachment A**.



7. Conclusions

Based on the results of the Soil and Groundwater Quality Investigation, there is no evidence of PHC or BTEX impacts to soil on Site at the locations investigated. Impacts to groundwater were identified on Site to the east and south of the existing pump island (TH4 and TH5). However, impacts to groundwater were previously identified in this area in the 2011 baseline investigation and subsequent sampling events on one or more occasion. There is no evidence that the groundwater conditions on-Site are substantially different than the baseline conditions established in 2011 and subsequent sampling events undertaken by others with respect to the contaminants of concern (PHCs/BTEX).

We trust this meets your needs at this time. Should you have any questions regarding the above, please do not hesitate to contact our office.

Regards,

GHD

Notes:

mASD	metres Above Site Datum.
mBGS	metres Below Ground Surface.
mBTOR	metres Below Top of Riser.
-	not measured
	Top of riser elevation was surveyed with respect to a storm sewer catch basin located northwest of the car wash, with an assumed elevation of 100 metres above Site datum (mASD).
(1)	Stratigraphic logs produced by Barenco in 2011 were used to source screened interval data for the pre-existing monitoring wells with exception to MW1-22/BH1-22 which was installed by GHD in 2022.
(2)	Well found to be damaged
(3)	Replacement well for TH1

LOCATES ONLY APPLICABLE TO INFO ABOVE - LOCATES VOID AFTER 60 DAYS!

SKETCH NOT TO SCALE

- USL-1 as a Private utility locator, is not permitted to locate Publicly owned utilities. In some cases, Public utilities may be noted on a sketch, but are FOR REFERENCE ONLY, and under no circumstances shall be used for excavation purposes. It is the contractor's responsibility to verify any Public utilities noted on the USL-1 sketch by referring to the Public utility locate sheets for physical LOCATION AND ACCURACY. USL-1 DOES NOT ASSUME LIABILITY FOR PUBLIC LOCATE INNACCURACIES.
- If the proposed work area is on Private property, it does NOT mean that all buried utilities are Private. Regardless of when you are digging, and what the proposed depth of excavation is, it is the law to notify Ontario One Call (or Info-Excavation in Quebec) to obtain Public utility locates.

COMMENTS: FUEL TANKS AND PRODUCT PIPES NOT LOCATED

THIS SKETCH IS NOT A PUBLIC UTILITY LOCATE/DOCUMENT. PUBLIC UTILITIES SHOWN ARE FOR REFERENCE ONLY. REFER TO USL-1 DISCLAIMER - FORM 101. CONTRACTOR IS RESPONSIBLE TO ENSURE THEY HAVE PUBLIC UTILITY LOCATES BEFORE COMMENCING WORK.

MAP SELECTION: Map Selection provided by the excavator through Ontario One Call's map tool or through agent interpretation by ph

Name: Site

Area: 7363.57sq. m

IMPORTANT INFORMATION: Please read.

Defining "NC" - Non-Compliant

- Non-compliant members have not met their obligations under section 5 of the Ontario Underground Infrastructure Notification Act. ON1Call has notified these members to ensure they are aware of your excavation. In this circumstance, should the member not respond, the excavator should contact the member directly to obtain their locates or request a status. ON1Call will not be provided with a locate status from the member regarding this request and therefore, cannot provide further information at this time. For locate status contact information please refer to our website.

You have a valid locate when...

- You have reviewed your locate request information for accuracy. UPDATE your request IMMEDIATELY if changes are needed and obtain a corrected locate request confirmation.

NOTE: Intersecting streets are often suggested by Ontario One Call's system, in some circumstances they may not reflect the closest intersecting streets to your excavation. You can change the intersecting streets before submitting the request by going through the "Review" page of your locate request, and editing any inaccurate information. Intersecting streets are for reference only, and unless you change the streets manually, you will not be asked to correct them if they are chosen by the system. If you don't agree with a street name, make sure to edit the request before you submit it, if you found a mistake after submitting the request, update your requests immediately on the web portal.

- You have obtained locates or clearances from all ON1Call members listed in this request before beginning your dig.

You've met your obligations when...

- You respect the marks and instructions provided by the locators and dig with care; the marks and locator instructions MUST MATCH. You must wait for responses from all members notified on your locate request before beginning to dig..
- You have obtained any necessary permits from the municipality in which you are digging.
- You have made Ontario One Call aware if you have come across any new or unlisted infrastructure in the public right of way AND stopped digging to prevent damages while we review.
- You have arranged for locates for your private lines on your private property - where applicable.

What does "Cleared" mean in the "Initial Status" section?

1. The information that you have provided about your dig will not affect that member's underground infrastructure and they have provided you with a
clearance, if anything about your excavation changes, please ensure that you update your request immediately.

What are the images under "Map Selection"?

1. A drawing created by an excavator directly within Ontario One Call's Web request tool, this is expected to be an accurate rendition of the dig site, and it is the excavator's responsibility to ensure the location matches the information they provide under the 'Dig Location'; section OR;

2. A drawing created by an Ontario One Call agent, this drawing is based on a verbal description by phone of the area by the excavator. Agents may create drawings that are larger than the proposed dig to minimize risk of interpretation. It is the excavator's responsibility to review these map selections for accuracy. Changes can be made by the excavator through the Web request tool, to learn how visit www.ontarioonecall.ca.

3. All drawings dictate which members are notified.

DISCLAIMER

The excavator must have a copy of this locate on the job site during excavation.

Locate area: The excavator must not work outside the area indicated in the location of work or located area in the diagram without an updated locate. Stakes or markings may disappear or be displaced. If any delays occur in acting on the stakeout information, or if markings become unclear, a new locate must be obtained.

Locating the plant: The plant location information provided is only an estimate. Depth of underground plant varies and the exact location must be determined by hand digging prior to excavation with mechanical equipment.

Warning: Do not use mechanical equipment within one (1) metre of the estimated location of the water or sewer plant. If the plant is larger than 406mm, mechanical equipment must not be used within three (3) meters.

Digging around exposed plants: Must do any further excavation within 0.3 metres of an exposed water or sewer plant by hand.

Contractors are to perform all work in accordance with applicable City of Ottawa By-laws and any applicable federal and provincial legislation or regulations, including but not limited to the *Public Utilities Act, R.S.O. 1990, c. P.52, s. 56(1)*; *Ontario Regulation 210/01 under the Technical Safety Standards Act, 2000 , S.O. 2000 c. 16*; *Ontario Regulation 213/91 under the Occupational Health and Safety Act, R.S.O. 1990, c. O.1.*

AVIS DE NON-RESPONSABILITÉ

L'opérateur de l'excavatrice doit avoir en sa possession ce rapport de localisation pendant l'excavation.

Zone de localisation : l'opérateur de l'excavatrice ne doit pas creuser en dehors de la zone indiquée sur l'ordre de travail ni à l'extérieur de la zone indiquée sur le diagramme, à moins d'avoir en sa possession un rapport de localisation actualisé. Les piquets ou les marques peuvent disparaître ou être déplacés. S'il y a un retard à intervenir sur la base des données de surveillance ou si le marquage devient imprécis, il faut obtenir un nouveau rapport de localisation.

Déterminer l'emplacement des conduites : les renseignements sur l'emplacement des conduites sont approximatifs. Pour déterminer l'emplacement et la profondeur, on doit creuser manuellement avant d'utiliser une excavatrice.

Avertissement : n'utilisez pas d'équipement mécanique [excavatrice] à moins d'un [1] mètre de l'emplacement supposé de la conduite d'eau ou d'égout. Si la conduite compte plus de 406 mm de diamètre, aucun équipement mécanique ne doit être utilisé à moins [3] de trois mètres de celle-ci.

Creuser autour des conduites exposées : toute excavation à moins de 0,3 m d'une conduite d'eau ou d'égout doit se faire manuellement.

Les entrepreneurs doivent exécuter tous les travaux conformément aux règlements de la Ville d'Ottawa et aux lois et règlements fédéraux ou provinciaux applicables, y compris, mais sans s'y limiter, la *Loi sur les services publics, L.R.O. 1990, chap. P.52, art. 56[1]*; le *Règlement 210/01 de l'Ontario* en vertu de la *Loi de 2000 sur les normes techniques et la sécurité, L.O. 2000, chap. 16*; et le *Règlement 213/91 de l'Ontario* en vertu de la *Loi sur la santé et la sécurité au travail L.R.O. 1990, chap. O.1.*

2020

Dear Excavator,

Re: Marking Preservation

Your City of Ottawa Water & Sewer locate request has been completed based on the information you provided Ontario One Call. The locate is valid for 60 days from the date indicated on the City of Ottawa Locate Report – Water and Sewer Utilities. Please be aware it's the requestors responsibility to contact Ontario One Call for a new locate if any changes are known, suspected or for a relocate if excavation continues beyond 60 days.

The City of Ottawa expects excavators to protect and preserve the paint marks and flags placed at the time of the original locate ticket. If markings are removed due to weather or excavation work, the excavator is expected to recreate the markings based on the tie-in measurements provided on the original locate ticket report. Valid locate documentation is always required to be on site.

This is in accordance with the below section from the Canadian Common Ground Alliance Best Practices handbook version 3.0 – October 2018 (p. 55)

4-16: Marking Preservation Practice Statement: *The excavator, where practical, protects and preserves the staking, marking, or other designations for underground facilities until no longer required for proper and safe excavation. The excavator stops excavating and notifies the notification service for re-marks if any facility mark is removed or no longer visible.*

If an excavator would like the City of Ottawa to refresh the markings, please contact Ontario One Call to request a Remark and reference the original locate ticket number.

Thank you,

City of Ottawa, Water and Sewer Locates

This form revised Sept 2021

April 06th, 2022

To all Excavators :

Bell locates are valid for the life of the excavation project and will not automatically be relocated every 90days.

Please note the following for the above apply:

A) Construction within the located area begins within 90 days of the "locate completed date" on the original ticket.

B) The construction company named on the locate remains active on the site.

Bell expects excavators will protect and preserve the paint marks put down on the original locate ticket. If markings are removed due to weather or excavation work, the excavator is expected to recreate the markings based on the tie-in measurements provided on the original locate ticket.

If an excavator would like their, markings freshened up, they can contact **Promark** (Bell Canada Locate Service Provider in this area) directly to arrange for them to place a fresh markings on the ground. **However, this will be at the excavator's expense.**

Promark can be reached at:

Toronto – 905-474-1114 toll free – 1-888-883-6273

Ottawa – 613-723-9888 toll free – 1-800-371-8866

The locate will be considered officially expired one day after the final day of construction.

Best regards

Kathleen Schaller

Re: ON Facility Locate Request: Results & Information

This is an important Safety Message from TELUS Communications Company regarding your Provincial One-Call Locate Request PLEASE REVIEW THIS ENTIRE MESSAGE! We are responding to your request to locate TELUS underground facilities in the specific area of excavation listed on this One-Call ticket.
Please note the life of all TELUS tickets in Ontario is 60 days from the completion of the request - Your locate request has been reviewed and its status is explained below*:

==========

Ticket: 20222225211
County: ONTARIO Place: OTTAWA
Address: 1660 MERIVALE RD

TELOE01:
The provincial one call ticket has been approved for work to begin, based on the information that was provided on the ticket as compared to the TELUS Underground Facility Records. Please see the following conditions and additional information to this response.*Please note* TELUS not required as there is no TELUS facilities in described dig area If you have any concerns regarding this ticket please reach out to our Screening Centre at 1-800-980-0030.

==========

If you have any questions or concerns regarding this response, please contact the Cable Locate Support Centre for Ontario by calling, 1-800-980-0030. We ask, that while excavating, you dig with caution. Thank You for using your local Dial / Click Before You Dig process!

Disclaimer

Warning!

The Excavator must have a copy of this locate on the job site during excavation.

Located Area: The Excavator must not work outside the area indicated, by the located area in the diagram, without a further locate completed by **Black & McDonald Limited.**

Locate the Plant: The plant location information provided is the best we have available, but constitutes only an estimate. Depth of underground plant varies and the exact location must be determined by hand digging prior to excavation with mechanical equipment.

Mechanical equipment must not be used within 1.0 meter of the estimated location of the plant.

Valid Documentation: This locate is valid only for the Agency accepting it. Other parties must obtain and accept their respective underground locate from **Ontario 1 Call.**

Excavator Alterations: Under no circumstance shall an Excavator touch or move an underground power cable. Arrangements must be made to have qualified personnel relocate any such cable.

Expose the plant: Once the plant has been located by hand digging, it must be exposed along its length adjacent to or in the immediate vicinity of the proposed excavation. For this purpose, mechanical equipment must not be used within 0.5 meters of the plant.

Digging around the Exposed Plant: When the plant has been exposed, any further excavation within 0.3 meters, must only be done by hand digging and not with mechanical equipment.

Support Requirements: If the underground plant is exposed over a distance of more than 1.25 meters, the Facility Owner must be notified. Underground plant must be supported at all times.

Private Cables: Please be advised that **Black & McDonald Limited** is not responsible for and does not locate private cables (e.g. parking lot lights and cables to O.C. Transpo signs/bus stops).

New Cables: Be aware that new cables could be installed at any time after the locate has been completed. It is the Excavator's responsibility to call for new locates if any changes are known or suspected.

Caution: The markings may disappear or be misplaced. Should sketch and markings not coincide, the Excavator must obtain a new locate. This is based on the information given at the time. Any changes to location or nature of work require a new locate. The Excavator must not work outside the indicated located area without a further locate. Privately owned services within the located area have not been marked- check with service/property owner.

Liability: Any person or Excavator who interferes with or damages any underground electrical cable without having obtained a valid locate/clearance from **Black & McDonald Limited**, shall be liable for all cost incurred during the repair of the cable as well as any resulting legal actions.

This locate has been given as accurately as possible, but no locate is guaranteed. Excavators must always dig with extreme caution to prevent the possibility of damaging electrical cables and endangering safety.

Locate is void after 90 days

For remarks contact **Ontario One Call** 1-800-400-2255 or www.on1call.com

PLEASE NOTE:

Locates Validity Change

As of February 1, 2022 all locate requests for the City of Ottawa Streetlights issued by Black and McDonald will now be Valid for 90 Days.

Please refer to the attached disclaimer for any questions or issues.

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Bureau Veritas Mississauga, 6740 Campobello Rd , Mississauga, ON, L5N 2L8
(2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Sample Matrix: Water
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Petroleum Hydro. CCME F1 & BTEX in Water (1)	1	N/A	2022/06/24	CAM SOP-00315	CCME PHC-CWS m
Petroleum Hydrocarbons F2-F4 in Water (1, 2)	1	2022/06/24	2022/06/24	CAM SOP-00316	CCME PHC-CWS m

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Bureau Veritas Mississauga, 6740 Campobello Rd , Mississauga, ON, L5N 2L8
(2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

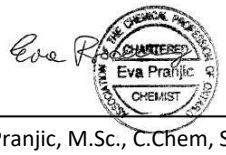
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)



NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Duplicate Parent ID

(2) Matrix Spike Parent ID [SYC846-01]

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by:

Ewa Pranjic, M.Sc., C.Chem, Scientific Specialist

Bureau Veritas has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Bureau Veritas Mississauga, 6740 Campobello Rd , Mississauga, ON, L5N 2L8
(2) No lab extraction date is given for F1BTEX & VOC samples that are field preserved with methanol. Extraction date is the date sampled unless otherwise stated.
(3) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following "Alberta Environment's Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003". Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	2.7°C
Package 2	1.7°C

Sample TAX195 [S-12583574-062822-NG-CTP1126-BH3-22-2] : F1 BTEX analysis: Detection limits were adjusted for sample weight.

Sample TAX201 [S-12583574-062822-NG-CTP1126-TCLP] : NF/NI=Non Flammable and Non Ignitable

Sample TAX205 [S-12583574-062822-NG-CTP1126-BH7-22-2] : F1 BTEX analysis: Detection limits were adjusted for sample weight.

Results relate only to the items tested.

Bureau Veritas 100 – 36 Antares Dr. Nepean, ON, K2E 7W5 Phone: 613-274-0573 Website: www.bvna.com

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Leachate Blank: A blank matrix containing all reagents used in the leaching procedure. Used to determine any process contamination.

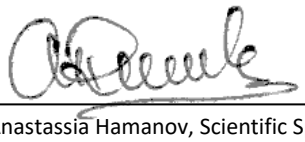
Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Duplicate Parent ID [TAX193-01]



(2) Duplicate Parent ID

(3) Matrix Spike Parent ID [TAX194-01]

(4) Duplicate Parent ID [TAX194-01]

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by:

Anastassia Hamanov, Scientific Specialist

Bureau Veritas has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Bureau Veritas Mississauga, 6740 Campobello Rd , Mississauga, ON, L5N 2L8
(2) All CCME PHC results met required criteria unless otherwise stated in the report. The CWS PHC methods employed by Bureau Veritas conform to all prescribed elements of the reference method and performance based elements have been validated. All modifications have been validated and proven equivalent following “Alberta Environment’s Interpretation of the Reference Method for the Canada-Wide Standard for Petroleum Hydrocarbons in Soil Validation of Performance-Based Alternative Methods September 2003”. Documentation is available upon request. Modifications from Reference Method for the Canada-wide Standard for Petroleum Hydrocarbons in Soil-Tier 1 Method: F2/F3/F4 data reported using validated cold solvent extraction instead of Soxhlet extraction.

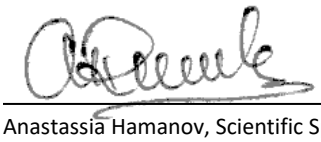
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.



Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Duplicate Parent ID

Rapport final

Services consultatifs de révision de rapports antérieurs d'évaluation environnementale

Propriété sise au 1660, route Merivale, (Napean), Ottawa, Ontario.

N/Réf. : HARNSITESP

Montréal-Est
Le vendredi 14 octobre 2022

HARNOIS Énergies
Att. : Monsieur Jean-Philippe Wilkins
Directeur, exploitation et développement immobilier
80, route 158
Saint-Thomas (QC)
JOK 3L0

TRANSMIS PAR COURRIEL :
jeanphilippewilkins@harnoisenergies.com

Objet : Service consultatif — Avis professionnel indépendant quant à la qualité environnementale du site et la conformité des études environnementales antérieures fournies par le client. Propriété sise au 1660, rue Merivale (Napean), Ottawa, Ontario

N/🗁 : HARNSITESP

Monsieur Wilkins,

Comme convenu, vous trouverez ci-après la lettre-rapport présentant l'avis professionnel de Groupe C. Laganière basé sur la révision des études environnementales complétées par différents consultants externes pour la propriété mentionnée en objet.

Cet exercice rigoureux de révision de rapports antérieurs a été réalisé en conformité avec le mandat cité dans l'offre de service datée du 25 août 2022 (réf : ODS 2022-226-SC – REV_08-2022_B), tel que vous l'avez signée le 30 août 2022.

1. MANDAT ET OBJECTIF

Le présent mandat consistait en une révision des études environnementales antérieures effectuées entre 2011 et 2022 par lesdites firmes externes, afin d'émettre une opinion professionnelle sur la pertinence et la conformité de leurs conclusions, de même qu'à émettre des recommandations, le cas échéant, en lien avec la qualité environnementale du site et les

exigences gouvernementales applicables. L'objectif était de valider si, pour seule la période d'opération du site par Canadian Tire Petroleum (CTP), une contamination a pu avoir eu lieu sur le site et y causer un préjudice environnemental. Pour y arriver, il fallait donc réviser le plus récent rapport (août 2022) en comparaison à celui de 2011, ce dernier étant le point de référence initial.

2. LIMITATIONS

Le processus de révision s'est fondé exclusivement sur les documents fournis par Harnois Énergies. Ces documents contiennent des limitations intrinsèques qui s'appliquent directement à la présente qui en dépend. Aucune inspection ou travail de caractérisation n'ont été réalisés sur le site par l'équipe de Groupe C. Laganière dans le cadre de ce mandat. Est également exclue du mandat toute considération portant sur une contamination issue d'autres activités que l'entreposage, l'utilisation et la distribution de produits pétroliers dans un contexte autre que l'activité commerciale d'une station-service el qu'entendu par la description des codes SCIAN (Système de classification des industries de l'Amérique du Nord, édition 2022)[1] 45711 ou 45721.

DESCRIPTION SOMMAIRE DU SITE ET DES ACTIVITÉS

Cette section présente la localisation du site de même que son usage actuel. La révision des rapports a permis de déterminer que la propriété est localisée au 1660, rue Merivale, Napean, Ottawa, Ontario et a une superficie totale de 6 623 m^2.

Le site est occupé par une station-service depuis 1968. Un bâtiment de service est présent au centre du terrain, avec les ilots de pompe juste au nord et les réservoirs souterrains dans le coin nord-est. Un lave-auto est présent dans la partie sud du terrain. Les bâtiments et ilots actuels ont été construits vers 1984 en remplacement d'un ancien bâtiment avec garage mécanique. Les réservoirs ont été remplacés en 1987 et en 2011, mais semblent toujours avoir été au même

[1] Le choix de cette codification sert à restreindre le type d'activité considérée qui est susceptible de contaminer les sols, les sédiments et les eaux souterraines. Cela n'a pas de lien avec la catégorie stations-service annoncée par le Règlement sur la protection et la réhabilitation des terrains de la législation québécoise.

endroit. L'emplacement des ilots de pompe a également été changé à cette époque. La station-service est exploitée par Canadian Tire Petroleum depuis 2011 (distributeur Esso/IOL).

Les coordonnées du centre du terrain à l'étude sont 45.343360 de latitude nord et -75.729596 de longitude ouest.

3. ÉVALUATIONS ENVIRONNEMENTALES DE SITE

Diverses études environnementales ont été réalisées sur ce site entre 2011 et 2022. Ces études ont été soumises à notre attention et un résumé est présenté comme suit :

3.1. Choix des critères de comparaison

Dans les études passées, tous les auteurs ont utilisé des critères de sols fins.

Les auteurs ont tous utilisé les critères de la table 3 correspondant à un dépôt meuble uniforme non mince et une utilisation non sensible de l'eau (eau souterraine non potable).

3.2. Études antérieures et résultats

Cette section présente les résultats des études et interventions passées sous forme de résumé en langage simple. La liste des études est également présentée sous forme de tableau à l'annexe A.

3.2.1. ÉES- Phase I– Barenco 2011.

Une ÉES – Phase 1 (N/Réf. : 11010) a été réalisée par la firme *Barenco Inc.* en octobre 2011 pour le compte de la compagnie *Imperial Oil*.

Cette étude a relevé la présence d'une station-service opérée par *Imperial Oil* (la Compagnie Impériale ltée.) sur le site depuis environ 1968. Le terrain appartenait à Imperial Oil depuis 1956.

En 2011, les installations étaient constituées d'un kiosque de service au centre du terrain (approximativement à l'emplacement d'un ancien garage mécanique), d'un abri attaché, de trois ilots de pompes et de quatre réservoirs souterrains d'essence en fibre de verre (trois de 22 700 L et un de 45 460 L) installés en 1987 dans le coin nord-est, ainsi que d'un lave-auto dans la partie sud. Les propriétés voisines sont à vocation résidentielle à l'ouest et au sud et commerciale au nord et à l'est.

La conclusion de ce rapport indique que des risques environnementaux ont été relevés en raison de l'activité de station-service sur le site. Plus précisément, les risques identifiés sont les réservoirs souterrains dans le coin nord-est, un ancien garage mécanique qui a opéré de 1968 à 1984 à l'ouest du kiosque actuel et la présence de remblai inconnu sur le site.

3.2.2. ÉES- Phase II – Barenco 2011

Une ÉES – Phase II (N/Réf. : *11010*) a été réalisée par la firme *Barenco inc.* en septembre 2011 pour le compte de la compagnie *Impérial Oil* pour diligence raisonnable avant le remplacement des réservoirs souterrains. Une analyse granulométrique des sols naturels a été faite par *EXP Associates Inc.* avec les sols prélevés lors de la caractérisation environnementale.

Lors de cette première caractérisation, cinq forages ont été réalisés jusqu'au roc, puis le roc en place a été carotté jusqu'à 5,8 m de profondeur et des puits d'observations ont été installés dans chaque forage. Les puits sont situés à l'ouest (TH1 et TH2) et à l'est (TH4 et TH5) des ilots de pompes, ainsi qu'à l'ouest des réservoirs souterrains (TH3).

Ces études ont déterminé que les sols naturels sur le site sont du till composé de silt sableux et argileux dont la conductivité hydraulique serait d'environ 10^{-5} cm/s. Le roc en place a été rencontré entre 2,7 et 3,4 m de profondeur.

Les analyses ont démontré l'absence de contamination dans les sols dans les cinq sondages réalisés.

L'eau souterraine dans les puits a été rencontrée entre 3,25 et 4,21 m de profondeur, généralement autour du niveau du sommet du roc. Aucune phase libre n'a été observée dans

les puits. L'écoulement souterrain se ferait vers le sud-ouest selon les élévations du niveau d'eau mesurées.

Les analyses de l'eau souterraine ont démontré la présence d'une contamination de l'eau souterraine dans trois des cinq puits (TH3, TH4 et TH5) pour les paramètres hydrocarbures pétroliers F1 à F4, Hexane (Ha) et BTEX.

En octobre 2011, deux autres forages ont été réalisés plus au sud, à l'ouest et à l'est du lave-auto et ont été converti en puits d'observations dans le roc. Aucune contamination n'a été mesurée dans les sols et l'eau souterraine à l'endroit de ces ouvrages.

3.2.3. Remplacement de réservoirs souterrains– Barenco 2011

Un programme de remplacement de réservoir a été réalisé en décembre 2011 pour le compte de la compagnie *Impérial Oil.* La station-service était opérée sous la bannière *ESSO.*

Les quatre réservoirs souterrains présents sur le site ont été vidés, nettoyés, démantelés puis retirés du site en octobre 2011. La tuyauterie souterraine les reliant aux ilots et aux tuyaux de ventilation a été laissée en place.

Le fond de l'excavation et une partie des parois étaient soit constitués de roc en place, soit de pierre concassée. Des échantillons ont été prélevés sur les parois de l'excavation où des sols étaient présents à neuf endroits sur chaque paroi. Des mesures en chantier ont été prises avec un détecteur de gaz. Quatorze échantillons de sols provenant des parois ont été soumis aux analyses. De faibles concentrations de BTEX ont été mesurées dans les sols de certains échantillons, mais aucun ne dépassait les critères applicables.

Quatre piles d'environ 50 tonnes chacune de déblais d'excavation pouvant être réutilisés ont été placées temporairement à proximité de l'excavation. Des sous-échantillons ont été prélevés dans chaque pile lors de leur entreposage. Deux des échantillons ont été soumis pour analyse en laboratoire et ont démontré l'absence de contamination dans ces sols. Un total de 627 t.m. de sols ne pouvant être utilisés comme matériaux de remblai ont été disposés hors-site.

Les nouveaux réservoirs ont été replacés dans l'excavation réalisée pour le retrait des anciens réservoirs. L'excavation a été remblayée avec la pierre concassée des déblais non contaminés et avec d'autres pierres concassées importées.

3.2.4. ÉES-Phase II– EXP 2013 - 2014

Une caractérisation environnementale des sols et de l'eau souterraine a été réalisée par EXP Energy Services Ltd (EXP) (anciennement Barenco Inc.) pour le compte de la compagnie *Imperial Oil*.

Cinq forages ont été réalisés dans les rues le long de la propriété au nord (Viewmount Drive) (TH8 et TH9) et à l'est (Merivale Road) (TH10 à TH12) afin de délimiter le panache d'eau souterraine contaminée.

Aucune contamination n'a été mesurée dans les sols. De la contamination en F1 et F2 a été mesurée dans l'eau souterraine pour les trois (3) puits situés le long de Merivale Road. Le niveau de l'eau souterraine se situe dans le roc qui a été rencontré à 2,44 m. Le sens d'écoulement de l'eau souterraine est vers le sud-ouest. Le puits TH9 était sec.

En 2014, EXP a procédé à une autre campagne de caractérisation dans les rues voisines, plus loin du site. Trois autres puits (TH100 à TH102) ont été installés plus à l'est et au nord-est. Aucune contamination n'a été mesurée dans les sols prélevés dans ces forages. L'eau souterraine était contaminée en F1 et F2 dans les deux puits installés à l'est des puits TH10 à TH12 dans la route Merivale, alors que celui au nord-est ne présentait pas de contamination. Le puits TH9 contenait de l'eau souterraine qui a été analysée. L'eau était contaminée en F1, F2 et F3 dans ce puits.

3.2.5. Suivi de l'eau souterraine– EXP 2014 et Golder 2015-2017

Des caractérisations de l'eau souterraine dans les puits sur le site et dans les rues ont été réalisées par *EXP* et *Golder* pour le compte de la compagnie *Imperial Oil*.

Des campagnes d'échantillonnages ont été réalisées en 2013 et 2014. Deux autres puits ont été installés en 2015 au sud et sud-ouest du puits TH7, près de la limite avec le voisin sud qui est résidentiel.

Aucune contamination de l'eau souterraine n'a été mesurée de 2011 à 2016 dans les puits TH1, TH2 et TH6, tous situés du côté ouest des installations. La contamination en F1 et F2 présente dans le puits TH3 montrait une diminution dans le temps jusqu'à respecter les critères en 2015. Les concentrations en BTEX, Ha, F1, F2 et F3 semblent également diminuer dans le puits TH4. Dans le puits TH5, les concentrations en BTEX, Ha et F1 ont diminué, mais celles en F2, F3 et F4 ont monté en 2013 avant de redescendre en 2014 et remonté en 2016. Finalement, les concentrations semblent avoir augmenté jusqu'en 2014 dans le puits TH7 qui présentait des dépassements en F1 et F2 pour ensuite redescendre sous les critères en 2016. Le puits MW15-02 installé en 2015 au sud du puits TH7 a montré une contamination en 2015, mais plus faible en 2016. La contamination semble donc migrée vers le sud.

Des suivis de l'eau souterraine ont également été réalisés jusqu'en 2017 dans les puits des rues environnantes. Une diminution des concentrations dans l'eau est notable dans la plupart des puits entre 2013 et 2015, mais une augmentation des concentrations a été notée dans plusieurs en 2016 et/ou 2017.

3.2.6. Plan de contrôle de la contamination / analyse de risque– EXP 2014 et Golder 2016

Un plan de contrôle de la contamination a été recommandé par *EXP* en 2014. Ce plan consistait à procéder à un suivi annuel de la présence de phase flottante, de l'analyse de l'eau souterraine.

Un plan de contrôle de la contamination a également été recommandé par *Golder* en 2016 pour la contamination de l'eau souterraine dans les rues environnantes. Ce plan consistait à procéder à un suivi annuel de la présence de phase flottante, de l'analyse de l'eau souterraine.

Une analyse du niveau de risque lié à la contamination de l'eau souterraine dans le roc a été réalisée par Golder en 2016. Cette analyse a démontré que la contamination de l'eau

souterraine dans le roc en place sous la rue ne représentait pas un risque pour la santé humaine ou des récepteurs écologiques.

3.2.7. Caractérisation des sols et de l'eau souterraine– GHD 2022

Une caractérisation des sols et de l'eau souterraine a été réalisée par GHD pour la compagnie Canadian Tire Corporation en aout 2022. Cette étude visait à comparer l'état de la contamination par rapport à celle présente en 2011, avant que CTP ne commence à opérer sur le site.

Pour ce faire, l'eau souterraine a été échantillonnée dans les puits existants sur le site et des forages ont été réalisés à côté des puits pour échantillonner les sols. L'un des puits n'était plus fonctionnel et a dû être refait.

Les concentrations mesurées dans les sols étaient toutes inférieures aux critères applicables selon la table 3 du MOE.

Les concentrations dans l'eau souterraine dans les puits TH1 à TH3, TH6, TH7 et MW15-02 étaient toutes inférieures aux critères applicables selon la table 3 du MOE. Des dépassements ont été mesurés en Xylènes (X), F1 et F2 dans les puits TH4 et TH5 situés à l'est et au sud des ilots de pompes.

4. DISCUSSION

4.1. Hydrogéologie et modèle conceptuel

Selon notre interprétation, la nappe d'eau souterraine se situe généralement dans le roc à une profondeur variant entre 2,3 m et 5,0 m sous la surface selon les saisons et l'emplacement sur le site. Le roc se situe généralement à une profondeur d'environ 3 m dans la partie nord du site, environ 5 m autour du lave-auto, soit le haut d'un talus et d'environ 2 m à la limite sud du site en bas de talus.

Les infrastructures actuelles et anciennes ont été remblayées avec des matériaux granulaires perméables et peuvent agir comme des zones de recharge pour le roc avec un apport de la surface et/ou des égouts.

Des nappes perchées peuvent être présentes dans les remblais ou au contact du roc. L'écoulement à cet endroit et dans les remblais est influencé par une conductivité accrue à l'interface du roc (voie de migration préférentielle) et selon l'arrangement des infrastructures souterraines. Le roc résiste à l'infiltration en comparaison au remblai. La nappe perchée peut disparaître selon les saisons (intermittente).

Selon les informations fournis lors du remplacement des réservoirs souterrains, ceux-ci sont placé directement sur le roc, entourés de pierre concassée. En cas d'évènements (fuite, déversement, bris, etc.) des contaminants en provenance des installations pétrolières devraient se disperser horizontalement à l'interface du roc d'une part et s'infiltrer dans le réseau de fissures du roc verticalement d'une autre part, mais plus lentement, jusqu'à l'eau souterraine. La contamination s'étendra ensuite sur la nappe et sera entraînée dans le sens d'écoulement de l'eau souterraine en solution.

La direction de l'écoulement régional s'effectue en direction sud-est vers la rivière Rideau, L'écoulement local semble généralement s'effectuer de manière radiale autour des infrastructures pétrolières et généralement vers le sud, le sud-ouest et le sud-est selon les relevés des différentes études. Les figures des études antérieures de GHD et Golder à l'annexe B, présentent la direction générale de l'écoulement mesurée au moment des relevés.

4.2. Choix des critères de comparaison

Le choix de la table de critères a été validé. Sur la base de l'analyse de l'ensemble de l'information, le site de Napean, utilisé à des fins commerciales, est en situation de sols majoritairement fins, de dépôt profond et l'eau souterraine n'est pas utilisée à des fins d'approvisionnement en eau potable. Sur cette base, l'utilisation des critères de la Table 3 est justifiée.

4.3. Évolution du niveau de contamination

Une comparaison a été faite entre la caractérisation des sols et des eaux souterraines en 2022 par rapport à celle faite en 2011 et dans les années subséquentes.

- Contamination dans les sols

Les résultats d'analyse obtenus sur les sols en 2022 ont montré des concentrations généralement non détectables. Seules les concentrations en BTEX et métaux, mesurées dans le forage BH-5-22, dépassaient légèrement la limite de détection. En 2011, seul l'éthylbenzène (E) présentait une concentration détectable. Les différences entre les deux sont cependant non significatives. La contamination en provenance de la base des infrastructures pétrolières a probablement pénétré directement le roc sans impacter les sols autour des infrastructures. Aucune nouvelle contamination des sols n'a été identifiée.

- Positionnement des ouvrages

Les forages et des puits sont généralement positionnés de manière à intercepter une éventuelle contamination en provenance des équipements. Un puits additionnel aurait été souhaité entre la fosse des réservoirs et l'ilot des pompes pour intercepter des indices de contamination en provenance de la fosse des réservoirs. Les infrastructures souterraines dans ce secteur limitent probablement l'emplacement possible d'un éventuel puits.

- Aménagement des puits

Selon les fiches de sondages montrant la stratigraphie des sols et du roc observés lors de l'installation des puits d'observations, ainsi que les détails d'installation des puits, la plupart des puits ont été installés avec un intervalle crépinée située dans le roc en place seulement. Les relevés des niveaux d'eau ont cependant montré dans certains cas que le niveau de l'eau souterraine était situé un peu au-dessus de l'intervalle crépinée. Aucune phase flottante n'a été observée dans puits, mais le niveau de l'eau souterraine dans les puits présentant de la contamination au-delà des critères était tous au-dessus du niveau de la crépine. Dans ces

conditions, une éventuelle phase flottante ne serait pas interceptée par le puits et ne pourrait donc pas être observée. Les données relatives à la phase flottante sont donc mises en doute.

- Méthode d'échantillonnage des eaux souterraines

Toutes les études indiquent que l'échantillonnage à faible débit a été utilisé pour l'échantillonnage de l'eau souterraine. Cette méthode d'échantillonnage est adaptée au type de contaminant présent sur le site.

- Sélection des paramètres analytiques

L'eau de plusieurs puits, généralement dans le secteur est du site et dans la rue, présente des dépassements des critères applicables en 2022. Le choix des paramètres analytiques de GHD qui correspond seulement aux benzène (B), xylènes (X) et F1-F2 ne couvre pas l'ensemble des paramètres problématiques préalablement identifiés. Des dépassements également mesurés occasionnellement en E, F3-F4 et Ha antérieurement au puits TH-5 n'ont pas été analysés en 2022.

- Contamination de l'eau souterraine

L'évolution des concentrations est présentée sous forme de graphiques normalisés à l'annexe C. La normalisation des concentrations correspond à diviser la concentration maximale obtenue pour un paramètre et un puits donné. Des histogrammes ont également été préparés pour représenter visuellement les paramètres les plus problématiques, soit les BTEX et les F1 et F2.

L'analyse des graphiques permet de montrer que la plupart des concentrations sont demeurées stables ou présentent une diminution par rapport aux concentrations mesurées dans les années précédentes.

- TH4 & TH5

  Les concentrations en B, X, F1, F2 analysées dans l'eau souterraine des puits TH4 et TH5 oscillent à la hausse et à la baisse durant la période d'occupation de CTP. Elles demeurent dans le même ordre de grandeur durant toute la période à l'exception d'une augmentation significative en F2 mesurée en 2013 dans les deux puits sans cependant augmentation des autres paramètres. Les concentrations mesurées en 2022 sont cependant inférieures aux concentrations initiales mesurées en 2011.

- TH7

  Une légère hausse suivie d'une baisse des concentrations a été constatée autour de 2014 dans le puits TH7. Le profil de la contamination est cependant resté le même.

- TH1

  Finalement, une concentration en F4 de 1200 ppm a été mesurée dans le puits TH1 en 2016, alors que ce paramètre a toujours été non détectable dans les autres campagnes d'échantillonnage. Selon les observations du laboratoire, une grande quantité de sédiments était présente dans l'échantillon. De plus, ce puits avait été échantillonné après le puits TH5 qui présentait une telle contamination. Ce puits a été rééchantillonné quelques semaines plus tard et les F4 étaient de nouveau non détectables. Il est possible que cette contamination origine d'une contamination croisée. Cette valeur est considérée comme une anomalie.

Les variations observées sont probablement dues aux changements du niveau de l'eau souterraine qui pourraient entrainer une solubilisation d'une contamination à la surface du roc. Selon les profils de contamination mesurés, cette contamination semble ancienne en raison du fractionnement observé.

De manière générale, la contamination mesurée dans l'eau souterraine semble provenir d'évènements antérieurs à l'occupation par CTP.

Les activités de CTP sur le site ne semblent pas avoir augmenté de manière significative la contamination dans l'eau souterraine par rapport au niveau initial de 2011. Les concentrations importantes mesurées en F2 au droit des puits TH4 et TH5 sont probablement reliées à une solubilisation de contaminant présents à l'interface du roc. Une nouvelle contamination aurait plutôt été associée à une augmentation simultanée des fractions plus légères. Cet évènement est donc associé à une contamination plus ancienne.

5. CONCLUSION ET RECOMMANDATIONS

5.1. Conclusion

La révision des études soumises indique que le terrain à l'étude a supporté deux générations de station-service avec des ilots de pompe à des endroits différents et un garage mécanique. Les installations actuelles sont présentes depuis les années 1980. Les réservoirs souterrains semblent toujours avoir été dans le coin nord-est du site.

La révision de ces rapports indique l'absence de contamination au niveau des sols. Les sols du site sont donc conformes aux critères applicables. De plus, aucune nouvelle contamination des sols sur le site n'a été identifiée.

Elle confirme toutefois qu'une contamination de l'eau souterraine persiste depuis au moins 2011, principalement dans le secteur des puits TH4 et TH5 situés à l'est et au sud des ilots de pompes. De 2011 à 2022, les concentrations semblent avoir diminuées de manière générale avec quelques augmentations sporadiques qui sont probablement reliées à la solubilisation d'une contamination ancienne lors de la fluctuation du niveau de la nappe.

Les données disponibles ne permettent pas de mettre en doute l'intégrité des équipements pétroliers.

Ainsi, il ne semble pas que l'opération par CTP ait augmenté significativement la contamination du site.

5.2. Recommendations

- Il est recommandé que des essais soient régulièrement réalisés sur les équipements pétroliers, notamment les ilots de pompes et la tuyauterie entre les réservoirs et les ilots, afin de valider leur intégrité et leur étanchéité si cette information n'est pas déjà disponible.

- Il est recommandé d'intégrer la surveillance des puits d'observation (reniflards) installés dans la fosse des réservoirs au programme de surveillance courant.

- Comme recommandation générale, le plan de contrôle de la contamination consistant en un suivi annuel des concentrations de contaminants dans l'eau souterraine et une vérification de phase flottante en place depuis 2014. Ceci devrait être poursuivi étant donné qu'il y a toujours présence d'une contamination dans l'eau souterraine. Les paramètres à analyser dans l'eau souterraine devraient minimalement inclure les BTEX, les F1 et les F2 dans tous les puits, ainsi que les F3, F4 et l'hexane dans les puits TH4 et TH5.

- L'aménagement de nouveaux puits avec l'espace crépiné chevauchant l'interface du roc et l'intervalle de fluctuation de la nappe phréatique est recommandé pour statuer sur la présence ou non de phase flottante. Ces puits pourraient être positionnés dans le secteur au sud-est des îlots où la contamination de l'eau souterraine est toujours présente.

- D'autres sondages pourraient également être réalisés à l'emplacement de l'ancien garage mécanique et des anciens îlots où de l'information est manquante pour établir le niveau de contamination global du site. Cette recommandation n'est pas nécessairement en lien avec l'occupation par CTP.

Lors de la cessation définitive des activités de la station-service, une caractérisation du terrain (Phase I et Phase II – sol et eau souterraine) selon les exigences de la Section IV.2.1 de la LQE, et l'attestation des rapports par un expert du MELCC seront obligatoires. Ceci inclura également l'inscription d'un avis de contamination sur le registre foncier (par le

propriétaire) selon l'article 31.58 de la section IV.2.1. de la LQE pour toute contamination excédant les valeurs limites de l'annexe I du RPRT (soit le niveau B du GI du MELCC).

Espérant le tout à votre entière satisfaction, nous vous prions d'agréer, Monsieur Wilkins, l'expression de nos sentiments les meilleurs.

Report

The documents (hereinafter referred to as the "Documents") to be released as part of the report (hereinafter referred to as the "Report") to be delivered to the purchaser as set out above are documents in Opta's records relating to the described property (hereinafter referred to as the "Property"). Opta makes no representations or warranties respecting the Documents whatsoever, including, without limitation, with respect to the completeness, accuracy or usefulness of the Documents, and does not represent or warrant that these are the only plans and reports prepared in association with the Property or in Opta's possession at the time of Report delivery to the purchaser. The Documents are current as of the date(s) indicated on them. Interpretation of the Documents, if any, is by inference based upon the information which is apparent and obvious on the face of the Documents only. Opta does not represent, warrant or guarantee that interpretations other than those referred to do not exist from other sources. The Report will be prepared for use by the purchaser of the services as shown above hereof only.

Disclaimer

Opta disclaims responsibility for any losses or damages of any kind whatsoever, whether consequential or other, however caused, incurred or suffered, arising directly or indirectly as a result of the services (which services include, but are not limited to, the preparation of the Report provided hereunder), including but not limited to, any losses or damages arising directly or indirectly from any breach of contract, fundamental or otherwise, from reliance on Opta Reports or from any tortious acts or omissions of Opta's agents, employees or representatives.

Entire Agreement

The parties hereto acknowledge and agree to be bound by the terms and conditions hereof. The request form constitutes the entire agreement between the parties pertaining to the subject matter hereof and supersedes all prior and contemporaneous agreements, negotiations and discussions, whether oral or written, and there are no representations or warranties, or other agreements between the parties in connection with the subject matter hereof except as specifically set forth herein. No supplement, modification, waiver, or termination of the request shall be binding, unless confirmed in writing by the parties hereto.

Governing Document

In the event of any conflicts or inconsistencies between the provisions hereof and the Reports, the rights and obligations of the parties shall be deemed to be governed by the request form, which shall be the paramount document.

Law

This agreement shall be governed by and construed in accordance with the laws of the Province of Ontario and the laws of Canada applicable therein.

RE: CITY DIRECTORY RESEARCH
1660 Chemin Merivale
Nepean,ON K2G 3K4

Thank you for contacting ERIS regarding our City Directory Search services. Our staff has conducted a reverse listing City Directory search to determine prior occupants of the subject site and adjacent properties. When searching a range of addresses, all civic addresses within that range found in the Directory are included.

Note: Reverse Listing Directories generally are focused on highly developed areas, while newly developed areas may be covered in the more recent years, older directories tend to cover only "central" parts of the city. To complete the search, we have either utilized the Toronto Reference Library, Library & Archives Canada and multiple digitized directories. While these do not claim to be a complete collection of all reverse listing city directories produced, ERIS has made every effort to provide accurate and complete information. ERIS shall not be held liable for missing, incomplete, or inaccurate information. If you believe there are additional addresses or streets that require searching, please contact us.

Search Criteria:

1660 of Merivale Road

Search Notes:

Notice: IMPORTANT LIMITATIONS and YOUR LIABILITY

Reliance on information in Report: This report DOES NOT replace a full Phase I Environmental Site Assessment but is solely intended to be used as a database review of environmental records.

License for use of information in Report: No page of this report can be used without this cover page, this notice and the project property identifier. The information in Report(s) may not be modified or re-sold.

Your Liability for misuse: Using this Service and/or its reports in a manner contrary to this Notice or your agreement will be in breach of copyright and contract and ERIS may obtain damages for such mis-use, including damages caused to third parties, and gives ERIS the right to terminate your account, rescind your license to any previous reports and to bar you from future use of the Service.

No warranty of Accuracy or Liability for ERIS: The information contained in this report has been produced by ERIS Information Limited Partnership ("ERIS") using various sources of information, including information provided by Federal and Provincial government departments. The report applies only to the address and up to the date specified on the cover of this report, and any alterations or deviation from this description will require a new report. This report and the data contained herein does not purport to be and does not constitute a guarantee of the accuracy of the information contained herein and does not constitute a legal opinion nor medical advice. Although ERIS has endeavored to present you with information that is accurate, ERIS disclaims, any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence, negligence or otherwise, and for any consequences arising therefrom. Liability on the part of ERIS is limited to the monetary value paid for this report.

Trademark and Copyright: You may not use the ERIS trademarks or attribute any work to ERIS other than as outlined above. This Service and Report (s) are protected by copyright owned by ERIS Information Limited Partnership. Copyright in data used in the Service or Report(s) (the "Data") is owned by ERIS or its licensors. The Service, Report(s) and Data may not be copied or reproduced in whole or in any substantial part without prior written consent of ERIS.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ***Note:*** *Databases denoted with " * " indicates that the database will no longer be updated. See the individual database description for more information.*

Abandoned Aggregate Inventory: Provincial AAGR

The MAAP Program maintains a database of abandoned pits and quarries. Please note that the database is only referenced by lot and concession and city/town location. The database provides information regarding the location, type, size, land use, status and general comments.*

Government Publication Date: Sept 2002*

Aggregate Inventory: Provincial AGR

This database of licensed and permitted pits and quarries is maintained by the Ontario Ministry of Natural Resources and Forestry (MNRF), as regulated under the Aggregate Resources Act, R.S.O. 1990. Aggregate site data has been divided into active and inactive sites. Active sites may be further subdivided into partial surrenders. In partial surrenders, defined areas of a site are inactive while the rest of the site remains active.

Government Publication Date: Up to Nov 2023

Abandoned Mine Information System: Provincial AMIS

The Abandoned Mines Information System contains data on known abandoned and inactive mines located on both Crown and privately held lands. The information was provided by the Ministry of Northern Development and Mines (MNDM), with the following disclaimer: "the database provided has been compiled from various sources, and the Ministry of Northern Development and Mines makes no representation and takes no responsibility that such information is accurate, current or complete". Reported information includes official mine name, status, background information, mine start/end date, primary commodity, mine features, hazards and remediation.

Government Publication Date: 1800-Apr 2024

Anderson's Waste Disposal Sites: Private ANDR

The information provided in this database was collected by examining various historical documents which aimed to characterize the likely position of former waste disposal sites from 1860 to present. The research initiative behind the creation of this database was to identify those sites that are missing from the Ontario MOE Waste Disposal Site Inventory, as well as to provide revisions and corrections to the positions and descriptions of sites currently listed in the MOE inventory. In addition to historic waste disposal facilities, the database also identifies certain auto wreckers and scrap yards that have been extrapolated from documentary sources. Please note that the data is not warranted to be complete, exhaustive or authoritative. The information was collected for research purposes only.

Government Publication Date: 1860s-Present

Aboveground Storage Tanks: Provincial AST

Historical listing of aboveground storage tanks made available by the Department of Natural Resources and Forestry. Includes tanks used to hold water or petroleum. This dataset has been retired as of September 25, 2014 and will no longer be updated.

Government Publication Date: May 31, 2014

Automobile Wrecking & Supplies: Private AUWR

This database provides an inventory of known locations that are involved in the scrap metal, automobile wrecking/recycling, and automobile parts & supplies industry. Information is provided on the company name, location and business type.

Government Publication Date: 1999-Apr 30, 2024

Borehole: Provincial BORE

A borehole is the generalized term for any narrow shaft drilled in the ground, either vertically or horizontally. The information here includes geotechnical investigations or environmental site assessments, mineral exploration, or as a pilot hole for installing piers or underground utilities. Information is from many sources such as the Ministry of Transportation (MTO) boreholes from engineering reports and projects from the 1950 to 1990's in Southern Ontario. Boreholes from the Ontario Geological Survey (OGS) including The Urban Geology Analysis Information System (UGAIS) and the York Peel Durham Toronto (YPDT) database of the Conservation Authority Moraine Coalition. This database will include fields such as location, stratigraphy, depth, elevation, year drilled, etc. For all water well data or oil and gas well data for Ontario please refer to WWIS and OOGW.

Government Publication Date: 1875-Jul 2018

Certificates of Approval: Provincial CA

This database contains the following types of approvals: Air & Noise, Industrial Sewage, Municipal & Private Sewage, Waste Management Systems and Renewable Energy Approvals. The MOE in Ontario states that any facility that releases emissions to the atmosphere, discharges contaminants to ground or surface water, provides potable water supplies, or stores, transports or disposes of waste, must have a Certificate of Approval before it can operate lawfully. Fields include approval number, business name, address, approval date, approval type and status. This database will no longer be updated, as CofA's have been replaced by either Environmental Activity and Sector Registry (EASR) or Environmental Compliance Approval (ECA). Please refer to those individual databases for any information after Oct.31, 2011.

Government Publication Date: 1985-Oct 30, 2011*

Dry Cleaning Facilities: Federal CDRY

List of dry cleaning facilities made available by Environment and Climate Change Canada. Environment and Climate Change Canada's Tetrachloroethylene (Use in Dry Cleaning and Reporting Requirements) Regulations (SOR/2003-79) are intended to reduce releases of tetrachloroethylene to the environment from dry cleaning facilities.

Government Publication Date: Jan 2004-Dec 2022

Commercial Fuel Oil Tanks: Provincial CFOT

Locations of commercial underground fuel oil tanks. This is not a comprehensive or complete inventory of commercial fuel tanks in the province; this listing is a copy of records of registered commercial underground fuel oil tanks obtained under Access to Public Information.
Note that the following types of tanks do not require registration: waste oil tanks in apartments, office buildings, residences, etc.; aboveground gas or diesel tanks. Records are not verified for accuracy or completeness.

Government Publication Date: Oct 2023

Chemical Manufacturers and Distributors: Private CHEM

This database includes information from both a one time study conducted in 1992 and private source and is a listing of facilities that manufacture or distribute chemicals. The production of these chemical substances may involve one or more chemical reactions and/or chemical separation processes (i.e. fractionation, solvent extraction, crystallization, etc.).

Government Publication Date: 1999-Jan 31, 2020

Chemical Register: Private CHM

This database includes a listing of locations of facilities within the Province or Territory that either manufacture and/or distributes chemicals.

Government Publication Date: 1999-Apr 30, 2024

Compressed Natural Gas Stations: Private CNG

Canada has a network of public access compressed natural gas (CNG) refuelling stations. These stations dispense natural gas in compressed form at 3,000 pounds per square inch (psi), the pressure which is allowed within the current Canadian codes and standards. The majority of natural gas refuelling is located at existing retail gasoline that have a separate refuelling island for natural gas. This list of stations is made available by the Canadian Natural Gas Vehicle Alliance.

Government Publication Date: Dec 2012 -Nov 2023

Inventory of Coal Gasification Plants and Coal Tar Sites: Provincial COAL

This inventory includes both the "Inventory of Coal Gasification Plant Waste Sites in Ontario-April 1987" and the Inventory of Industrial Sites Producing or Using Coal Tar and Related Tars in Ontario-November 1988) collected by the MOE. It identifies industrial sites that produced and continue to produce or use coal tar and other related tars. Detailed information is available and includes: facility type, size, land use, information on adjoining properties, soil condition, site operators/occupants, site description, potential environmental impacts and historic maps available. This was a one-time inventory.*

Government Publication Date: Apr 1987 and Nov 1988*

Compliance and Convictions: Provincial CONV

This database summarizes the fines and convictions handed down by the Ontario courts beginning in 1989. Companies and individuals named here have been found guilty of environmental offenses in Ontario courts of law.

Government Publication Date: 1989-Mar 2024

Certificates of Property Use: Provincial CPU

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include CPU's on the registry such as (EPA s. 168.6) - Certificate of Property Use.

Government Publication Date: 1994 - Mar 31, 2024

Drill Hole Database: Provincial DRL

The Ontario Drill Hole Database contains information on more than 113,000 percussion, overburden, sonic and diamond drill holes from assessment files on record with the department of Mines and Minerals. Please note that limited data is available for southern Ontario, as it was the last area to be completed. The database was created when surveys submitted to the Ministry were converted in the Assessment File Research Image Database (AFRI) project. However, the degree of accuracy (coordinates) as to the exact location of drill holes is dependent upon the source document submitted to the MNDM. Levels of accuracy used to locate holes are: centering on the mining claim; a sketch of the mining claim; a 1:50,000 map; a detailed company map; or from submitted a "Report of Work".

Government Publication Date: 1886 - Aug 2023

Delisted Fuel Tanks: Provincial DTNK

List of fuel storage tank sites that were once found in - and have since been removed from - the list of fuel storage tanks made available by the regulatory agency under Access to Public Information.

Government Publication Date: Oct 2023

Environmental Activity and Sector Registry: Provincial EASR

On October 31, 2011, a smarter, faster environmental approvals system came into effect in Ontario. The EASR allows businesses to register certain activities with the ministry, rather than apply for an approval. The registry is available for common systems and processes, to which preset rules of operation can be applied. The EASR is currently available for: heating systems, standby power systems and automotive refinishing. Businesses whose activities aren't subject to the EASR may apply for an ECA (Environmental Compliance Approval), Please see our ECA database.

Government Publication Date: Oct 2011-Apr 30, 2024

Environmental Registry: Provincial EBR

The Environmental Registry lists proposals, decisions and exceptions regarding policies, Acts, instruments, or regulations that could significantly affect the environment. Through the Registry, thirteen provincial ministries notify the public of upcoming proposals and invite their comments. For example, if a local business is requesting a permit, license, or certificate of approval to release substances into the air or water; these are notified on the registry. Data includes: Approval for discharge into the natural environment other than water (i.e. Air) - EPA s. 9, Approval for sewage works - OWRA s. 53(1), and EPA s. 27 - Approval for a waste disposal site. For information regarding Permit to Take Water (PTTW), Certificate of Property Use (CPU) and (ORD) Orders please refer to those individual databases.

Government Publication Date: 1994 - Mar 31, 2024

Environmental Compliance Approval: Provincial ECA

On October 31, 2011, a smarter, faster environmental approvals system came into effect in Ontario. In the past, a business had to apply for multiple approvals (known as certificates of approval) for individual processes and pieces of equipment. Today, a business either registers itself, or applies for a single approval, depending on the types of activities it conducts. Businesses whose activities aren't subject to the EASR may apply for an ECA. A single ECA addresses all of a business's emissions, discharges and wastes. Separate approvals for air, noise and waste are no longer required. This database will also include Renewable Energy Approvals. For certificates of approval prior to Nov 1st, 2011, please refer to the CA database. For all Waste Disposal Sites please refer to the WDS database.

Government Publication Date: Oct 2011-Apr 30, 2024

Environmental Effects Monitoring: Federal EEM

The Environmental Effects Monitoring program assesses the effects of effluent from industrial or other sources on fish, fish habitat and human usage of fisheries resources. Since 1992, pulp and paper mills have been required to conduct EEM studies under the Pulp and Paper Effluent Regulations. This database provides information on the mill name, geographical location and sub-lethal toxicity data.

Government Publication Date: 1992-2007*

ERIS Historical Searches: Private EHS

ERIS has compiled a database of all environmental risk reports completed since March 1999. Available fields for this database include: site location, date of report, type of report, and search radius. As per all other databases, the ERIS database can be referenced on both the map and "Statistical Profile" page.

Government Publication Date: 1999-Mar 31, 2024

Environmental Issues Inventory System: Federal EIIS

The Environmental Issues Inventory System was developed through the implementation of the Environmental Issues and Remediation Plan. This plan was established to determine the location and severity of contaminated sites on inhabited First Nation reserves, and where necessary, to remediate those that posed a risk to health and safety; and to prevent future environmental problems. The EIIS provides information on the reserve under investigation, inventory number, name of site, environmental issue, site action (Remediation, Site Assessment), and date investigation completed.

Government Publication Date: 1992-2001*

Emergency Management Historical Event: Provincial EMHE

List of locations of historical occurrences of emergency events, including those assigned to the Ministry of Natural Resources by Order-In-Council (OIC) under the Emergency Management and Civil Protection Act, as well as events where MNR provided requested emergency response assistance. Many of these events will have involved community evacuations, significant structural loss, and/or involvement of MNR emergency response staff. These events fall into one of ten (10) type categories: Dam Failure; Drought / Low Water; Erosion; Flood; Forest Fire; Soil and Bedrock Instability; Petroleum Resource Center Event, EMO Requested Assistance, Continuity of Operations Event, Other Requested Assistance. EMHE record details are reproduced by ERIS under License with the Ontario Ministry of Natural Resources © Queen's Printer for Ontario, 2017.

Government Publication Date: Apr 30, 2022

Environmental Penalty Annual Report: Provincial EPAR

This database contains data from Ontario's annual environmental penalty report published by the Ministry of the Environment and Climate Change. These reports provide information on environmental penalties for land or water violations issued to companies in one of the nine industrial sectors covered by the Municipal Industrial Strategy for Abatement (MISA) regulations.

Government Publication Date: Jan 1, 2011 - Dec 31, 2022

List of Expired Fuels Safety Facilities: Provincial EXP

List of facilities and tanks for which there was once a fuel registration. This is not a comprehensive or complete inventory of expired tanks/tank facilities in the province; this listing is a copy of previously registered tanks and facilities obtained under Access to Public Information. Includes private fuel outlets, bulk plants, fuel oil tanks, gasoline stations, marinas, propane filling stations, liquid fuel tanks, piping systems, etc; includes tanks which have been removed from the ground.
Notes: registration was not required for private fuel underground/aboveground storage tanks prior to January 1990, nor for furnace oil tanks prior to May 1, 2002; registration is not required for waste oil tanks in apartments, office buildings, residences, etc., or aboveground gas or diesel tanks. Records are not verified for accuracy or completeness.

Government Publication Date: Oct 2023

Federal Convictions: Federal FCON

Environment Canada maintains a database referred to as the "Environmental Registry" that details prosecutions under the Canadian Environmental Protection Act (CEPA) and the Fisheries Act (FA). Information is provided on the company name, location, charge date, offence and penalty.

Government Publication Date: 1988-Jun 2007*

Contaminated Sites on Federal Land: Federal FCS

The Federal Contaminated Sites Inventory includes information on known federal contaminated sites under the custodianship of departments, agencies and consolidated Crown corporations as well as those that are being or have been investigated to determine whether they have contamination arising from past use that could pose a risk to human health or the environment. The inventory also includes non-federal contaminated sites for which the Government of Canada has accepted some or all financial responsibility. It does not include sites where contamination has been caused by, and which are under the control of, enterprise Crown corporations, private individuals, firms or other levels of government. Includes fire training sites and sites at which Per- and Polyfluoroalkyl Substances (PFAS) are a concern.

Government Publication Date: Jun 2000-Mar 2024

Fisheries & Oceans Fuel Tanks: Federal FOFT

Fisheries & Oceans Canada maintains an inventory of aboveground & underground fuel storage tanks located on Fisheries & Oceans property or controlled by DFO. Our inventory provides information on the site name, location, tank owner, tank operator, facility type, storage tank location, tank contents & capacity, and date of tank installation.

Government Publication Date: 1964-Sep 2019

Federal Identification Registry for Storage Tank Systems (FIRSTS): Federal FRST

A list of federally regulated Storage tanks from the Federal Identification Registry for Storage Tank Systems (FIRSTS). FIRSTS is Environment and Climate Change Canada's database of storage tank systems subject to the Storage Tank for Petroleum Products and Allied Petroleum Products Regulations. The main objective of the Regulations is to prevent soil and groundwater contamination from storage tank systems located on federal and aboriginal lands. Storage tank systems that do not have a valid identification number displayed in a readily visible location on or near the storage tank system may be refused product delivery.

Government Publication Date: Oct 31, 2021

Fuel Storage Tank: Provincial FST

List of registered private and retail fuel storage tanks. This is not a comprehensive or complete inventory of private and retail fuel storage tanks in the province; this listing is a copy of registered private and retail fuel storage tanks, obtained under Access to Public Information.
Notes: registration was not required for private fuel underground/aboveground storage tanks prior to January 1990, nor for furnace oil tanks prior to May 1, 2002; registration is not required for waste oil tanks in apartments, office buildings, residences, etc., or aboveground gas or diesel tanks. Records are not verified for accuracy or completeness.

Government Publication Date: Oct 2023

Fuel Storage Tank - Historic: Provincial FSTH

The Fuels Safety Branch of the Ontario Ministry of Consumer and Commercial Relations maintained a database of all registered private fuel storage tanks. Public records of private fuel storage tanks are only available since the registration became effective in September 1989. This information is now collected by the Technical Standards and Safety Authority.

Government Publication Date: Pre-Jan 2010*

Ontario Regulation 347 Waste Generators Summary: Provincial GEN

Regulation 347 of the Ontario EPA defines a waste generation site as any site, equipment and/or operation involved in the production, collection, handling and/or storage of regulated wastes. A generator of regulated waste is required to register the waste generation site and each waste produced, collected, handled, or stored at the site. This database contains the registration number, company name and address of registered generators including the types of hazardous wastes generated. It includes data on waste generating facilities such as: drycleaners, waste treatment and disposal facilities, machine shops, electric power distribution etc. This information is a summary of all years from 1986 including the most currently available data. Some records may contain, within the company name, the phrase "See & Use..." followed by a series of letters and numbers. This occurs when one company is amalgamated with or taken over by another registered company. The number listed as "See & Use", refers to the new ownership and the other identification number refers to the original ownership. This phrase serves as a link between the 2 companies until operations have been fully transferred.

Government Publication Date: 1986-Oct 31, 2022

Greenhouse Gas Emissions from Large Facilities: Federal GHG

List of greenhouse gas emissions from large facilities made available by Environment Canada. Greenhouse gas emissions in kilotonnes of carbon dioxide equivalents (kt CO2 eq).

Government Publication Date: 2013-Dec 2021

TSSA Historic Incidents: Provincial HINC

List of historic incidences of spills and leaks of diesel, fuel oil, gasoline, natural gas, propane, and hydrogen recorded by the TSSA in their previous incident tracking system. The TSSA's Fuels Safety Program administers the Technical Standards & Safety Act 2000, providing fuel-related safety services associated with the safe transportation, storage, handling and use of fuels such as gasoline, diesel, propane, natural gas and hydrogen. Under this Act, the TSSA regulates fuel suppliers, storage facilities, transport trucks, pipelines, contractors and equipment or appliances that use fuels. Records are not verified for accuracy or completeness. This is not a comprehensive or complete inventory of historical fuel spills and leaks in the province. This listing is a copy of the data captured at one moment in time and is hence limited by the record date provided here.

Government Publication Date: 2006-June 2009*

Indian & Northern Affairs Fuel Tanks: Federal IAFT

The Department of Indian & Northern Affairs Canada (INAC) maintains an inventory of aboveground & underground fuel storage tanks located on both federal and crown land. Our inventory provides information on the reserve name, location, facility type, site/facility name, tank type, material & ID number, tank contents & capacity, and date of tank installation.

Government Publication Date: 1950-Aug 2003*

Fuel Oil Spills and Leaks: Provincial INC

Listing of spills and leaks of diesel, fuel oil, gasoline, natural gas, propane, and hydrogen reported to the Spills Action Centre (SAC). This is not a comprehensive or complete inventory of fuel-related leaks, spills, and incidents in the province; this listing in a copy of incidents reported to the SAC, obtained under Access to Public Information. Includes incidents from fuel-related hazards such as spills, fires, and explosions. Records are not verified for accuracy or completeness.

Government Publication Date: 31 Oct, 2023

Landfill Inventory Management Ontario: Provincial LIMO

The Landfill Inventory Management Ontario (LIMO) database is updated every year, as the Ministry of the Environment, Conservation and Parks compiles new and updated information. Includes small and large landfills currently operating as well as those which are closed and historic. Operators of larger landfills provide landfill information for the previous operating year to the ministry for LIMO including: estimated amount of total waste received, landfill capacity, estimated total remaining landfill capacity, fill rates, engineering designs, reporting and monitoring details, size of location, service area, approved waste types, leachate of site treatment, contaminant attenuation zone and more. The small landfills include information such as site owner, site location and certificate of approval # and status.

Government Publication Date: Mar 31, 2022

Canadian Mine Locations: Private MINE

This information is collected from the Canadian & American Mines Handbook. The Mines database is a national database that provides over 290 listings on mines (listed as public companies) dealing primarily with precious metals and hard rocks. Listed are mines that are currently in operation, closed, suspended, or are still being developed (advanced projects). Their locations are provided as geographic coordinates (x, y and/or longitude, latitude). As of 2002, data pertaining to Canadian smelters and refineries has been appended to this database.

Government Publication Date: 1998-2009*

Mineral Occurrences: Provincial MNR

In the early 70's, the Ministry of Northern Development and Mines created an inventory of approximately 19,000 mineral occurrences in Ontario, in regard to metallic and industrial minerals, as well as some information on building stones and aggregate deposits. Please note that the "Horizontal Positional Accuracy" is approximately +/- 200 m. Many reference elements for each record were derived from field sketches using pace or chain/tape measurements against claim posts or topographic features in the area. The primary limiting factor for the level of positional accuracy is the scale of the source material. The testing of horizontal accuracy of the source materials was accomplished by comparing the plan metric (X and Y) coordinates of that point with the coordinates of the same point as defined from a source of higher accuracy.

Government Publication Date: 1846-Feb 2024

National Analysis of Trends in Emergencies System (NATES): Federal NATE

In 1974 Environment Canada established the National Analysis of Trends in Emergencies System (NATES) database, for the voluntary reporting of significant spill incidents. The data was to be used to assist in directing the work of the emergencies program. NATES ran from 1974 to 1994. Extensive information is available within this database including company names, place where the spill occurred, date of spill, cause, reason and source of spill, damage incurred, and amount, concentration, and volume of materials released.

Government Publication Date: 1974-1994*

Non-Compliance Reports: Provincial NCPL

The Ministry of the Environment provides information about non-compliant discharges of contaminants to air and water that exceed legal allowable limits, from regulated industrial and municipal facilities. A reported non-compliance failure may be in regard to a Control Order, Certificate of Approval, Sectoral Regulation or specific regulation/act.

Government Publication Date: Dec 31, 2022

National Defense & Canadian Forces Fuel Tanks: Federal NDFT

The Department of National Defense and the Canadian Forces maintains an inventory of all aboveground & underground fuel storage tanks located on DND lands. Our inventory provides information on the base name, location, tank type & capacity, tank contents, tank class, date of tank installation, date tank last used, and status of tank as of May 2001. This database will no longer be updated due to the new National Security protocols which have prohibited any release of this database.

Government Publication Date: Up to May 2001*

National Defense & Canadian Forces Spills: Federal NDSP

The Department of National Defense and the Canadian Forces maintains an inventory of spills to land and water. All spill sites have been classified under the "Transportation of Dangerous Goods Act - 1992". Our inventory provides information on the facility name, location, spill ID #, spill date, type of spill, as well as the quantity of substance spilled & recovered.

Government Publication Date: Mar 1999-Nov 2023

National Defence & Canadian Forces Waste Disposal Sites: Federal NDWD

The Department of National Defence and the Canadian Forces maintains an inventory of waste disposal sites located on DND lands. Where available, our inventory provides information on the base name, location, type of waste received, area of site, depth of site, year site opened/closed and status.

Government Publication Date: 2001-Apr 2007*

National Energy Board Pipeline Incidents: Federal NEBI

Locations of pipeline incidents from 2008 to present, made available by the Canada Energy Regulator (CER) - previously the National Energy Board (NEB). Includes incidents reported under the Onshore Pipeline Regulations and the Processing Plant Regulations related to pipelines under federal jurisdiction, does not include incident data related to pipelines under provincial or territorial jurisdiction.

Government Publication Date: 2008-Jun 30, 2021

National Energy Board Wells: Federal NEBP

The NEBW database contains information on onshore & offshore oil and gas wells that are outside provincial jurisdiction(s) and are thereby regulated by the National Energy Board. Data is provided regarding the operator, well name, well ID No./UWI, status, classification, well depth, spud and release date.

Government Publication Date: 1920-Feb 2003*

National Environmental Emergencies System (NEES): Federal NEES

In 2000, the Emergencies program implemented NEES, a reporting system for spills of hazardous substances. For the most part, this system only captured data from the Atlantic Provinces, some from Quebec and Ontario and a portion from British Columbia. Data for Alberta, Saskatchewan, Manitoba and the Territories was not captured. However, NEES is also a repository for previous Environment Canada spill datasets. NEES is composed of the historic datasets ' or Trends ' which dates from approximately 1974 to present. NEES Trends is a compilation of historic databases, which were merged and includes data from NATES (National Analysis of Trends in Emergencies System), ARTS (Atlantic Regional Trends System), and NEES. In 2001, the Emergencies Program determined that variations in reporting regimes and requirements between federal and provincial agencies made national spill reporting and trend analysis difficult to achieve. As a consequence, the department has focused efforts on capturing data on spills of substances which fall under its legislative authority only (CEPA and FA). As such, the NEES database will be decommissioned in December 2004.

Government Publication Date: 1974-2003*

National PCB Inventory: Federal NPCB

Environment Canada's National PCB inventory includes information on in-use PCB containing equipment in Canada including federal, provincial and private facilities. Federal out-of-service PCB containing equipment and PCB waste owned by the federal government or by federally regulated industries such as airlines, railway companies, broadcasting companies, telephone and telecommunications companies, pipeline companies, etc. are also listed. Although it is not Environment Canada's mandate to collect data on non-federal PCB waste, the National PCB inventory includes some information on provincial and private PCB waste and storage sites. Some addresses provided may be Head Office addresses and are not necessarily the location of where the waste is being used or stored.

Government Publication Date: 1988-2008*

National Pollutant Release Inventory 1993-2020: Federal NPR2

The National Pollutant Release Inventory (NPRI) is Canada's public inventory of pollutant releases (to air, water and land), disposals, and transfers for recycling. The inventory, managed by Environment and Climate Change Canada, tracks over 300 substances. Under the authority of the Canadian Environmental Protection Act (CEPA), owners or operators of facilities that meet published reporting requirements are required to report to the NPRI.

Government Publication Date: Sep 2020

National Pollutant Release Inventory - Historic: Federal NPRI

Environment Canada has defined the National Pollutant Release Inventory ("NPRI") as a federal government initiative designed to collect comprehensive national data regarding releases to air, water, or land, and waste transfers for recycling for more than 300 listed substances. This data holds historic records; current records are found in NPR2.

Government Publication Date: 1993-May 2017

Oil and Gas Wells: Private OGWE

The Nickle's Energy Group (publisher of the Daily Oil Bulletin) collects information on drilling activity including operator and well statistics. The well information database includes name, location, class, status and depth. The main Nickle's database is updated on a daily basis, however, this database is updated on a monthly basis. More information is available at www.nickles.com.

Government Publication Date: 1988-Feb 29, 2024

Ontario Oil and Gas Wells: Provincial OOGW

In 1998, the MNR handed over to the Ontario Oil, Gas and Salt Resources Corporation, the responsibility of maintaining a database of oil and gas wells drilled in Ontario. The OGSR Library has over 20,000+ wells in their database. Information available for all wells in the ERIS database include well owner/operator, location, permit issue date, and well cap date, license No., status, depth and the primary target (rock unit) of the well being drilled. All geology/stratigraphy table information, plus all water table information is also provide for each well record.

Government Publication Date: 1800-Aug 2023

Inventory of PCB Storage Sites: Provincial OPCB

The Ontario Ministry of Environment, Waste Management Branch, maintains an inventory of PCB storage sites within the province. Ontario Regulation 11/82 (Waste Management - PCB) and Regulation 347 (Generator Waste Management) under the Ontario EPA requires the registration of inactive PCB storage equipment and/or disposal sites of PCB waste with the Ontario Ministry of Environment. This database contains information on: 1) waste quantities; 2) major and minor sites storing liquid or solid waste; and 3) a waste storage inventory.

Government Publication Date: 1987-Oct 2004; 2012-Dec 2013

Orders: Provincial ORD

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include Orders on the registry such as (EPA s. 17) - Order for remedial work, (EPA s. 18) - Order for preventative measures, (EPA s. 43) - Order for removal of waste and restoration of site, (EPA s. 44) - Order for conformity with Act for waste disposal sites, (EPA s. 136) - Order for performance of environmental measures.

Government Publication Date: 1994 - Mar 31, 2024

Canadian Pulp and Paper: Private PAP

This information is part of the Pulp and Paper Canada Directory. The Directory provides a comprehensive listing of the locations of pulp and paper mills and the products that they produce.

Government Publication Date: 1999, 2002, 2004, 2005, 2009-2014

Parks Canada Fuel Storage Tanks: Federal PCFT

Canadian Heritage maintains an inventory of known fuel storage tanks operated by Parks Canada, in both National Parks and at National Historic Sites. The database details information on site name, location, tank install/removal date, capacity, fuel type, facility type, tank design and owner/operator.

Government Publication Date: 1920-Jan 2005*

Pesticide Register: Provincial PES

The Ontario Ministry of the Environment and Climate Change maintains a database of licensed operators and vendors of registered pesticides.

Government Publication Date: Oct 2011-Apr 30, 2024

NPRI Reporters - PFAS Substances: Federal PFCH

The National Pollutant Release Inventory (NPRI) is Canada's public inventory of releases, disposals, and transfers, tracking over 320 pollutants. Per - and polyfluoroalkyl substances (PFAS) are a group of over 4,700 human-made substances for which adverse environmental and health effects have been observed. This listing of PFAS substance reporters includes those NPRI facilities that reported substances that are found in either: a) the Comprehensive Global Database of PFASs compiled by the Organisation for Economic Co-operation and Development (OECD), b) the US Environmental Protection Agency (US EPA) Master List of PFAS Substances, c) the US EPA list of PFAS chemicals without explicit structures, or d) the US EPA list of PFAS structures (encompassing the largest set of structures having sufficient levels of fluorination to potentially impart PFAS-type properties).

Government Publication Date: Sep 2020

Potential PFAS Handlers from NPRI: Federal PFHA

The National Pollutant Release Inventory (NPRI) is Canada's public inventory of releases, disposals, and transfers, tracking over 320 pollutants. Per - and polyfluoroalkyl substances (PFAS) are a group of over 4,700 human-made substances for which adverse environmental and health effects have been observed. This list of potential PFAS handlers includes those NPRI facilities that reported business activity (NAICS code) included in the US Environmental Protection Agency (US EPA) list of Potential PFAS-Handling Industry Sectors, further described as operating in industry sectors where literature reviews indicate that PFAS may be handled and/or released. Inclusion of a facility in this listing does not indicate that PFAS are being manufactured, processed, used, or released by the facility - these are facilities that potentially handle PFAS based on their industrial profile.

Government Publication Date: Sep 2020

Pipeline Incidents: Provincial PINC

List of pipeline incidents (strikes, leaks, spills). This is not a comprehensive or complete inventory of pipeline incidents in the province; this listing in an historical copy of records previously obtained under Access to Public Information. Records are not verified for accuracy or completeness.

Government Publication Date: Feb 28, 2021

Private and Retail Fuel Storage Tanks: Provincial PRT

The Fuels Safety Branch of the Ontario Ministry of Consumer and Commercial Relations maintained a database of all registered private fuel storage tanks and licensed retail fuel outlets. This database includes an inventory of locations that have gasoline, oil, waste oil, natural gas and/or propane storage tanks on their property. The MCCR no longer collects this information. This information is now collected by the Technical Standards and Safety Authority (TSSA).

Government Publication Date: 1989-1996*

Permit to Take Water: Provincial PTTW

This is a subset taken from Ontario's Environmental Registry (EBR) database. It will include PTTW's on the registry such as OWRA s. 34 - Permit to take water.

Government Publication Date: 1994 - Mar 31, 2024

Ontario Regulation 347 Waste Receivers Summary: Provincial REC

Part V of the Ontario Environmental Protection Act ("EPA") regulates the disposal of regulated waste through an operating waste management system or a waste disposal site operated or used pursuant to the terms and conditions of a Certificate of Approval or a Provisional Certificate of Approval. Regulation 347 of the Ontario EPA defines a waste receiving site as any site or facility to which waste is transferred by a waste carrier. A receiver of regulated waste is required to register the waste receiving facility. This database represents registered receivers of regulated wastes, identified by registration number, company name and address, and includes receivers of waste such as: landfills, incinerators, transfer stations, PCB storage sites, sludge farms and water pollution control plants. This information is a summary of all years from 1986 including the most currently available data.

Government Publication Date: 1986-1990, 1992-2021

Record of Site Condition: Provincial RSC

The Record of Site Condition (RSC) is part of the Ministry of the Environment's Brownfields Environmental Site Registry. Protection from environmental cleanup orders for property owners is contingent upon documentation known as a record of site condition (RSC) being filed in the Environmental Site Registry. In order to file an RSC, the property must have been properly assessed and shown to meet the soil, sediment and groundwater standards appropriate for the use (such as residential) proposed to take place on the property. The Record of Site Condition Regulation (O. Reg. 153/04) details requirements related to site assessment and clean up. RSCs filed after July 1, 2011 will also be included as part of the new (O.Reg. 511/09). The Government of Ontario states that it is not responsible for the accuracy of the information in this Registry.

Government Publication Date: 1997-Sept 2001, Oct 2004-Apr 2024

Retail Fuel Storage Tanks: Private RST

This database includes an inventory of retail fuel outlet locations (including marinas) that have on their property gasoline, oil, waste oil, natural gas and / or propane storage tanks.

Government Publication Date: 1999-Apr 30, 2024

Scott's Manufacturing Directory: Private SCT

Scott's Directories is a data bank containing information on over 200,000 manufacturers across Canada. Even though Scott's listings are voluntary, it is the most comprehensive database of Canadian manufacturers available. Information concerning a company's address, plant size, and main products are included in this database.

Government Publication Date: 1992-Mar 2011*

Ontario Spills: Provincial SPL

List of spills and incidents made available by the Ministry of the Environment, Conservation and Parks. This database identifies information such as location (approximate), type and quantity of contaminant, date of spill, environmental impact, cause, nature of impact, etc. Information from 1988-2002 was part of the ORIS (Occurrence Reporting Information System). The SAC (Spills Action Centre) handles all spills reported in Ontario. Regulations for spills in Ontario are part of the MOE's Environmental Protection Act, Part X. The Ministry of the Environment, Conservation and Parks cites the coronavirus pandemic as an explanation for delays in releasing data pursuant to requests. This database includes spill incidents that occurred in Mar 2023-Feb 2024 in addition to those listed in the Government Publication Date.

Government Publication Date: 1988-Jan 2023; see description

Wastewater Discharger Registration Database: Provincial SRDS

Facilities that report either municipal treated wastewater effluent or industrial wastewater discharges under the Effluent Monitoring and Effluent Limits (EMEL) and Municipal/Industrial Strategy for Abatement Regulations. The Municipal/Industrial Strategy for Abatement (MISA) division of the Ontario Ministry of Environment keeps record of direct dischargers of toxic pollutants within nine sectors including: Electric Power Generation, Mining, Petroleum Refining, Organic Chemicals, Inorganic Chemicals, Pulp & Paper, Metal Casting, Iron & Steel, and Quarries.

Government Publication Date: 1990-Dec 31, 2021

Anderson's Storage Tanks: Private TANK

The information provided in this database was collected by examining various historical documents, which identified the location of former storage tanks, containing substances such as fuel, water, gas, oil, and other various types of miscellaneous products. Information is available in regard to business operating at tank site, tank location, permit year, permit & installation type, no. of tanks installed & configuration and tank capacity. Data contained within this database pertains only to the city of Toronto and is not warranted to be complete, exhaustive or authoritative. The information was collected for research purposes only.

Government Publication Date: 1915-1953*

Transport Canada Fuel Storage Tanks: Federal TCFT

List of fuel storage tanks currently or previously owned or operated by Transport Canada. This inventory also includes tanks on The Pickering Lands, which refers to 7,530 hectares (18,600 acres) of land in Pickering, Markham, and Uxbridge owned by the Government of Canada since 1972; properties on this land has been leased by the government since 1975, and falls under the Site Management Policy of Transport Canada, but is administered by Public Works and Government Services Canada. This inventory provides information on the site name, location, tank age, capacity and fuel type.

Government Publication Date: 1970 - Apr 2023

Variances for Abandonment of Underground Storage Tanks: Provincial VAR

Listing of variances granted for storage tank abandonment. This is not a comprehensive or complete inventory of tank abandonment variances in the province; this listing is a copy of tank abandonment variance records previously obtained under Access to Public Information. In Ontario, registered underground storage tanks must be removed within two years of disuse; if removal of a tank is not feasible, an application may be sought for a variance from this code requirement.
Records are not verified for accuracy or completeness.

Government Publication Date: Feb 28, 2022

Waste Disposal Sites - MOE CA Inventory: Provincial WDS

The Ontario Ministry of Environment, Waste Management Branch, maintains an inventory of known open (active or inactive) and closed disposal sites in the Province of Ontario. Active sites maintain a Certificate of Approval, are approved to receive and are receiving waste. Inactive sites maintain Certificate(s) of Approval but are not receiving waste. Closed sites are not receiving waste. The data contained within this database was compiled from the MOE's Certificate of Approval database. Locations of these sites may be cross-referenced to the Anderson database described under ERIS's Private Source Database section, by the CA number. All new Environmental Compliance Approvals handed out after Oct 31, 2011 for Waste Disposal Sites will still be found in this database.

Government Publication Date: Oct 2011-Apr 30, 2024

Waste Disposal Sites - MOE 1991 Historical Approval Inventory: Provincial WDSH

In June 1991, the Ontario Ministry of Environment, Waste Management Branch, published the "June 1991 Waste Disposal Site Inventory", of all known active and closed waste disposal sites as of October 30st, 1990. For each "active" site as of October 31st 1990, information is provided on site location, site/CA number, waste type, site status and site classification. For each "closed" site as of October 31st 1990, information is provided on site location, site/CA number, closure date and site classification. Locations of these sites may be cross-referenced to the Anderson database described under ERIS's Private Source Database section, by the CA number.

Government Publication Date: Up to Oct 1990*

Water Well Information System: Provincial WWIS

This database describes locations and characteristics of water wells found within Ontario in accordance with Regulation 903. It includes such information as coordinates, construction date, well depth, primary and secondary use, pump rate, static water level, well status, etc. Also included are detailed stratigraphy information, approximate depth to bedrock and the approximate depth to the water table.

Government Publication Date: Dec 31 2023

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

APPENDIX 9
Contingent and limiting conditions

GROUPE
C. LAGANIÈRE

This environmental assessment is subject to, but not limited to, the following conditions :

- The environmental assessment represents the condition of the site as observed during our site visit. The information contained herein is provided to the best of our knowledge and in light of the data available to *Groupe C. Laganière (1995) inc*. at the time of writing.

- As portions of this report are based on information or reports prepared by others, therefore, *Groupe C. Laganière (1995) inc*. cannot be held responsible for all the information provided in this report.

- *Groupe C. Laganière (1995) Inc*. disclaims all responsibility for any conclusions that may prove erroneous due to the deliberate concealment or unavailability of relevant information.

- The property visit was conducted in a manner ensuring the health and safety of personnel. Consequently, only safely accessible sites were visited according to the methodology described in the report.

- No finishing work, such as walls or ceilings, was removed, damaged, or destroyed to allow visual inspection behind them.

- No analysis or sampling of soil, surface water, groundwater, air, or construction materials was performed as part of this assessment, except as specifically requested and recorded in this report.

- The identification of certain substances or equipment that may contain them, such as polychlorinated biphenyls (PCBs), asbestos, lead, mold, and urea-formaldehyde foam insulation (UFFI), is based solely on visual clues or documents found during the file review. It is not based on laboratory analysis unless otherwise indicated in Chapter 1, "Introduction." These substances may still be present on the property, even though no visual evidence was found during the site visit. They may be located behind walls, under ceilings, or in air vents. Consequently, *Groupe C. Laganière (1995) Inc*. does not guarantee the absence of substances such as PCBs, asbestos, UFFI, lead, or mold.

- The identification of ozone-depleting substances, radon, and electromagnetic interference is excluded from Phase I ESA, as the identification of these substances or interference is deemed irrelevant or impractical.

- Adjoining properties and structures were observed from the study site or from publicly accessible routes.

- The environmental assessment of the property may not be used in conjunction with any other environmental site assessment or audit unless written consent has been obtained from *Groupe C. Laganière (1995) Inc*. This document must be considered as a whole, and no part of it may be used separately.

- The signatories of this document are not obligated to appear in court as experts in connection with this appraisal unless prior agreement has been reached with the client.

- Possession of this report or a copy does not confer the right to reproduce or publish it, nor the right of use by anyone other than the customer, without the written consent of *Groupe C. Laganière (1995) Inc*. Any use made of it by a third party, or any decision based on its contents taken by such a third party, shall remain the sole responsibility of that party.

- This report and its conclusions do not constitute legal advice.

- Since environmental contamination can be highly localized and heterogeneous, the conclusions in this report apply only to the locations tested. Site-wide conclusions are provided for informational purposes only and do not guarantee the absence or presence of contamination or sources of contamination at locations other than those audited.

- The presence or absence of contamination or sources of contamination described in this study should be considered valid only for the period during which the site visit was conducted. These findings may change due to natural phenomena or human activities undertaken subsequently on the site or adjacent sites.

APPENDIX 10
Substances requiring special attention

GROUPE
C. LAGANIÈRE

Due to public concern about health effects and environmental protection legislation, certain substances require special attention. These substances are described in the following sections. The information presented here is primarily sourced from the Health Canada website, along with other provincial and territorial entities' websites.

Asbestos

Asbestos is a fibrous mineral known for its insulating and fire-retardant properties. It was commonly used in building materials from the 1930s to the 1990s. Asbestos was primarily employed for thermal insulation and soundproofing in buildings and homes, as well as for fireproofing. Asbestos was found in materials such as:

- Cement and plaster;
- Industrial furnaces and heating systems;
- Building insulation;
- Floor and ceiling tiles;
- House siding;
- Automotive and truck brake pads;
- Vehicle transmission components, such as clutches.

Asbestos fibers pose a significant health risk when inhaled, potentially causing cancer and other respiratory diseases. The hazard arises when asbestos-containing materials are damaged, cut, or disturbed, releasing fibers into the air.

Since the Hazardous Products Act came into effect in Canada in 1980, the use of certain types of asbestos in building materials has been prohibited. Since 2018, Canadian regulations have banned the import, sale, and use of asbestos, as well as the manufacture, import, sale, and use of asbestos-containing products, with some exceptions. However, asbestos fibers may still be present in constructions and materials installed before these laws and regulations were enacted.

Materials that may contain asbestos include:

- Insulation
- Flockings
- Asbestos cement materials (siding panels, soffit panels, pipes, etc.)
- Plaster, stucco and other decorative finishes
- Vinyl floor tiles on cement backing and their adhesives
- Ceiling tiles and their adhesives and suspended ceiling panels
- Gypsum panels and joint compounds
- Asphalt roofing shingles and bitumen roofing board
- Miscellaneous insulation (boiler, ventilation duct) and vermiculite insulation

Materials that do not contain asbestos include :

- Wood, natural stone, marble, stoneware, glass, plastics and metals

- Gypsum wallboard and joint compounds manufactured by North American companies since January 1, 1980
- Flocklining installed in buildings and civil engineering structures since February 15, 1990
- Thermal insulation installed in buildings and civil engineering structures since May 20, 1999

PCBs

The use of polychlorinated biphenyls (PCBs) in the manufacture of electrical equipment, such as transformers, fluorescent lamp ballasts, and capacitors, was common until the late 1970s. They were also used in caulking and sealants, cutting oils, inks, and paint additives. PCBs are highly persistent in the environment.

Federal PCB Regulation, DORS/91-152, prohibits the import, sale, and manufacture of PCBs, as well as their use in electrical equipment installed after July 1, 1980. However, the use of existing equipment containing PCBs is still permitted.

Halocarbons

Halocarbons are halogenated compounds that deplete the ozone layer. They are used in refrigeration, air conditioning, and fire extinguishing systems, as well as in the manufacture of solvents. The import, manufacture, use, and sale of certain halocarbons have been regulated since the 1990s under the Regulation Respecting Substances That Deplete the Ozone Layer.

Urea formaldehyde-based insulating foam

Urea-formaldehyde foam insulation (UFFI) was commonly used in new and existing construction in Canada during the 1970s, until it was banned in 1980 under the Hazardous Products Act. It was used to insulate and improve the thermal efficiency of industrial and commercial buildings, as well as older homes.

UFFI can release formaldehyde gas both during and after curing. When exposed to water, it can degrade and release additional formaldehyde gas. Additionally, UFFI can promote mold growth.

Lead-based paint

Lead was formerly used in paint both as a pigment and to promote drying. Since 1976, the Hazardous Products Act has restricted the lead content in coatings to 0.5% (by weight), equivalent to 5000 mg/kg. In 1991, discussions between Health Canada and paint manufacturers led to the phase-out of lead in paints. By 2010, regulations for lead-containing consumer products were implemented in Canada, further reducing the allowable lead content to 90 mg/kg.

Paints produced before 1976 may contain lead in concentrations that are harmful to human health. However, these paints pose a risk primarily when they peel or flake, as the lead-containing particles could be ingested or inhaled.

Leaded petrol

Lead was first used as an additive in gasoline in the 1920s. However, from the 1970s onwards, the use of unleaded gasoline increased. Since 1990, the use of leaded gasoline in automobiles has been banned in Canada under the Canadian Environmental Protection Act.

Therefore, gasoline produced and sold before 1990 may contain lead in concentrations that are harmful to human health.

Radon

Radon is a radioactive gas that emanates from uranium or thorium in soil and rocks. It occurs naturally, but its concentrations can vary from region to region.

Radon can migrate through cracks in the ground and infiltrate buildings, such as through cracks in foundations, slabs, pipe joints, drains, or sumps. This gas tends to accumulate in low, poorly ventilated areas of buildings.

Inhalation of radon can cause lung cancer. Exposure to radon can be quantified using a dosimeter over a three-month period, ideally during the winter.

Mold

Molds are filamentous fungi that can grow on building materials in homes and other buildings. Mold growth is typically the result of a moisture problem, such as condensation on surfaces due to excessive humidity, water leaks, seepage through roof or foundation cracks, or flooding.

When mold is present, air quality can be affected as spores and mycelium fragments disperse into the air and can be inhaled. Inhalation of these particles can lead to respiratory problems and asthma.
