INDUSTRIAL SEWAGE WORKS ECA #2844-9YNGZC
2019 ANNUAL REPORT

ORGANICS COMPOSTING FACILITY
5123 HAWTHORNE ROAD
OTTAWA, ONTARIO

Prepared By:

David Veinot
Convertus Canada Ltd.

March 26, 2020

Introduction

The facility commenced operation on January 28th 2010. This annual report was prepared to comply with Condition 10(2) of the Facility's Amended Certificate of Approval Industrial Sewage Works Number 2844-9YNGZC issued February 1, 2017.

This report will cover the following points:

(a) a description of any operating problems encountered and corrective actions taken;
(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works*;
(c) a summary of all effluent monitoring results undertaken in the reporting period;
(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;
(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;
(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and
(e) any other information the *District Manager* requires from time to time;

1.0 Background

The facility is located on a 10.14 hectare parcel of leased land at 5123 Hawthorne Road in an area zoned heavy industrial.

A total of 80,847 tonnes of material was received from the City of Ottawa's curbside residential program and a further 2,043 tonnes was from the IC&I sector, for a total incoming receipt of 82,890 tonnes in 2019. This is a 5% increase from the 78,762 tonnes processed by the facility in 2018. The facility is permitted by the MECP to process up to 150,000 tonnes per year.

The incoming organic material underwent conversion into two main end-use products in 2019. Convertus Ottawa shipped 5,876 tonnes of processed organic material under approved NASM (Non-Agricultural Source Material) plans issued by OMAFRA (Ontario Ministry of Agriculture, Food and Rural Affairs). A further 15,343 tonnes was shipped as animal bedding in 2019 to dairy (non-milking) and beef cattle farms for use in their box stalls.

In 2018, Convertus entered into a new disposal contract with Englobe Corporation of Quebec to use Mid-Fraction organic materials (SSO that has undergone the shredding and composting operation and has been screened at least once to remove contaminants) for use in several of their contaminated soil remediation and organic composting operations in Quebec. In 2019 Englobe processed 6,616 tonnes of Mids from Convertus Ottawa.

In 2019, Convertus entered into a new disposal contract with 6608604 (Uteau) owned by Maurice Charlebois, and headquartered in Cantley, Quebec. This firm will use a portion of the

Mid-Fraction organic materials at their screening line in Portage-du-Fort, QC to separate the organics fraction from the Overs (residual) fraction. The organic fraction will be marketed to farmers in Quebec as a soil supplement. The receiving site is licenced by the Province of Quebec for the receipt and processing of such wastes. In 2019 Uteau processed 2,570 tonnes of Mids, primarily during the peak leaf and yard seasons.

2.0 Operating Problems

Convertus Ottawa did not encounter any problems with the operation of the *Sewage Works* in 2019.

The system worked as designed, and because the facility is not connected to a municipal fresh water supply, the pond provided all of the process make-up water the facility required until July 2019.

Usage of this process make-up water within the facility included:

1) Ensuring the fire suppression water tank is full at all times
2) Providing clean water to moisten the biofilters
3) Providing clean water to supply the bioscrubber and the ammonia scrubbers
4) Spray in the composting tunnels during periods of water deficit in the warmer months

In July 2019, the plumbing system was modified so that the process make-up water was obtained directly from the EW107-15 extraction well instead of the stormwater retention pond. This change was done to allow the extraction well to pump as much impacted groundwater from beneath the facility as possible, improving its efficiency as a contaminant control/remediation device. The plumbing system to the pond was left in place in case of a back-up water source becoming necessary.

There were no operating problems with the Process Water Recirculation System beyond regular maintenance activities.

The earthen berm was inspected several times during 2019. No remediation work was deemed to be required as the berm was found to be in good shape.

3.0 Maintenance Work

The storm water management pond had a total of 6 aerators installed to improve the water quality by agitating and oxygenating the pond water. The aerators also allow the pond to be sampled during the cold winter months when the majority of the pond's surface is iced over. The first aerator was installed on July 10, 2018, and an additional five aerators were installed on November 28, 2018. Except for some unplanned downtime for a few of the aerators as a result of the units freezing in the winter, the aerators worked as intended in 2019.

The Armtec 20-10C cast iron sluice gate valve was examined for leakage by Convertus maintenance personnel following the April 2019 discharge period when the pond water level was low enough to allow safe entry into the concrete chamber containing the valve and PVC piping. The valve was found to be sealing properly.

No other maintenance activities were carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works* in 2019.

4.0 Effluent monitoring results

ECA #2844-9YNGZC requires in Condition 4(1) that Convertus must take grab samples of pond water from the Storm Water Management Pond at a monthly frequency and analyzed for the parameters listed in Table 1.

"Convertus Ottawa 2019 Storm Water Pond Analysis Summary" contains analytical results for the storm water pond sampling carried out in 2019 and is contained in this report as Attachment 1.

Pond water samples were taken in all twelve months in 2019, largely in part to the successful operation of the pond aerators which ensured an area of open water during the winter months allowing a water sample to be obtained.

ECA #2844-9YNGZC requires in Condition 5(5) that prior to any discharge of the SWM Pond to the natural environment, Convertus shall collect grab samples and analyze for the appropriate parameters using the analytical protocols listed in Condition 4(2). Convertus shall compare the monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of storm water prior to allowing any discharge from the SWM Pond.

The SWM Pond was discharged once in 2019 during the month of April. A description of pond water sampling and discharge timing is provided in this report as Attachment 2. As a comparison, the SWM Pond was discharged twice in 2018.

5.0 Summary of Leachate Contaminated Sewage Hauled Off Site

There was no leachate-contaminated sewage in the storm water pond. No pond water was transferred off-site for waste disposal in 2019.

6.0 Calibration and Maintenance of Effluent Monitoring Equipment

There is no effluent monitoring of the storm water pond per se. The pond has a level reading device installed in an adjacent catch basin which does not require calibration after initial set-up. The unit is an Endress+Hauser 4-20mA level transmitter. All other analyses required for the storm water pond is performed at a certified laboratory.

7.0 Groundwater Monitoring Results

The MECP requires that Convertus carries out a groundwater monitoring program in accordance with the requirements described in Condition 9 of our ECA (Sewage) 2844-9YNGZC. All analytical results and water level elevations obtained from the ground water monitoring program are included in an annual *Groundwater and Surface Water Monitoring Report* provided to the MECP each Spring.

Convertus Ottawa Sewage Report 2019 Timeline

Convertus Ottawa SWM Pond Sampling/Discharge Report 2019

Timeline:

January 29, 2019	Storm water pond sampled in accordance with ECA requirements.
February 11, 2019	Storm water pond sampled in accordance with ECA requirements.
March 14, 2019	Storm water pond sampled in accordance with ECA requirements.
April 03, 2019	Storm water pond sampled in accordance with ECA requirements to determine if water is OK to discharge. Laboratory analysis indicated that sample is within prescribed parameters in Table 2 "Trigger Parameters" in ECA 2844-9YNGZC. Sluice gate opened 2" on April 15th, and pond water was allowed to discharge until April 30th when the valve was closed. No sign of blockages or backups. Pond was discharged to allow inspection of the seals in the sluice gate – which were found to be in good condition. Valve condition checked again on May 1st, 2019 and there was no leakage observed.
May 22, 2019	Storm water pond sampled in accordance with ECA requirements. A value for COD was not provided in the laboratory analysis. COD is not a regulated compound for discharge.
June 06, 2019	Storm water pond sampled in accordance with ECA requirements.
July 09, 2019	Storm water pond sampled in accordance with ECA requirements.
August 07, 2019	Storm water pond sampled in accordance with ECA requirements. Permit level for temperature exceeded.
September 10, 2019	Storm water pond sampled in accordance with ECA requirements. Permit level for pH exceeded.
October 21, 2109	Storm water pond sampled in accordance with ECA requirements. Permit value for E.coli exceeded.
November 22, 2019	Storm water pond sampled in accordance with ECA requirements.
December 17, 2019	Storm water pond sampled in accordance with ECA requirements. Permit level for E.coli exceeded.

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/28	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Recommended Compliance and Trigger Level Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline a recommended groundwater Compliance and Trigger Level Program (TLP) for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Facility) located at the 5123 Hawthorne Road, Ottawa, Ontario (Site). The TLP has been developed to satisfy Condition 9(8) of the Environmental Compliance Approval (Industrial Sewage Works No. 7251-8GKRPD) (ECA) for the Site and is being submitted in support of an application to amend the ECA. The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

The following Section discusses the results of previous assessments of groundwater compliance and trigger level assessments for the Site. A recommended TLP for the Site is presented in Section 3.0.

2.0 Background

The OCL Site is approximately 10 hectares in area and is situated in the southwest corner of the Hawthorne Industrial Park (HIP) subdivision, which covers an area of approximately 80 hectares. Since the early/mid 1990's, the HIP subdivision has historically received excess fill materials from various construction and demolition projects, which is understood to consist primarily of clean soil with some concrete debris and reclaimed asphalt pavement and aggregate materials, and has also been intermittently used for temporary storage of various construction related materials. The area surrounding the HIP subdivision has a number of mineral aggregate extraction operations in place (south-east, west, and north-west of HIP), some of which are still active. The OCL Site was also subject to mineral aggregate removals prior to Facility development by OCL. Given the historic and ongoing land uses around the subject Site, there is the potential for soil, groundwater, and surface water quality impairment related to the various past activities.

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

As part of the ECA development for this Site, the MOE requested a groundwater monitoring program be implemented to ensure that the proposed operation of the OCL Facility does not adversely affect the surrounding environment (there are concerns for downstream agricultural users of the shallow/surface water regime, and for the deeper-aquifer which supplies potable water to a number of nearby properties). The purpose of the groundwater monitoring program is to evaluate the potential impact of OCL activities on the groundwater and surface water quality; regular monitoring allows for the analysis of trends over time and ensures there is an early warning of potential problems.

Previous assessments of groundwater quality at the Site have identified pre-existing groundwater quality as an obstacle to developing a functional TLP for groundwater in the current Site context. Historical backfill material used on Site, as well as historical and surrounding land uses have resulted in highly variable groundwater quality. For this reason, typical assessments using generic water quality standards as the basis for assessing compliance at the Site boundary do not provide meaningful indications of the effects of Facility operations on groundwater quality.

Condition 9(3b) of the ECA requires the development of criteria in accordance with MOE Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). CRA initially completed an assessment of on-Site water quality in accordance with the Reasonable Use Concept in a memo to Tracy Hart of the MOE dated February 5, 2010. Assessments of water quality provided in Annual Monitoring Reports following submission of the February 5, 2010 memo concluded that the application of the Reasonable Use Concept at the downgradient property boundary is irrelevant due to the presence of numerous parameters elevated above generic standards in background water quality. As such, the Site-specific criteria calculated using the Reasonable Use Concept are not considered appropriate for evaluating Site compliance.

A groundwater trigger level assessment that used intra-well baseline data was provided in the 2012 Annual Monitoring Report for the Site. This type of assessment can be useful for identifying potential increases in groundwater quality impacts by comparing current data to statistically-based upper tolerance limits (UTLs) developed from historical data at individual wells. However, the use of trigger levels based on intra-well baseline UTLs is not considered appropriate for the Site for the following reasons:

1. There is insufficient pre-start-up data to provide statistically valid intra-well baseline data.
2. The intra-well baseline method does not account for the movement of pre-start-up water quality impacts from one portion of the Site to another. Based on the highly variable water quality on-Site prior to start-up of Facility operations, this could yield false triggers in downgradient on-Site monitoring wells.

3.0 Recommended Compliance and Trigger Level Program

For the purposes of assessing potential groundwater quality impairments related to the activities approved under the ECA, comparison of post-start-up data to pre-start-up data provides a useful comparison. Water quality data from pre-start-up monitoring demonstrated considerable variability within the shallow unconfined aquifer across the Site. This pattern is consistent with variable pre-existing sources of water

quality impacts upgradient and/or on-Site. Some sources of water quality impacts un-related to the Facility operations include: current and historical quarrying operations located upgradient of the Site, historical backfill materials used for grading at the Site, and various other current and historical industrial and agricultural activities in the vicinity.

Therefore, in consideration of the variable water quality pre-existing Facility operations, it is recommended that the aggregate Site-wide pre-start-up water quality data be used as the basis for establishing groundwater trigger levels for the shallow unconfined aquifer. The pre-start-up data is all data collected from shallow unconfined aquifer monitoring wells between July 2008 and January 2010. By using an appropriate statistical representation of the overall pre-existing water quality, the trigger levels will provide indications of new water quality impairments, not related to historical activities. This method will reduce the potential for trigger levels being exceeded at specific on-Site monitoring locations due to the migration of pre-existing water quality impairments within the Site boundaries.

It is recommended that the groundwater trigger level program focus on a reduced set of parameters that reflect the sources of potential impact from on-Site activities. These parameters will thus act as surrogates for Site-related water quality impacts. Based on a review of water quality data for the Site and the known sources of impact associated with organic waste processing, the trigger level program should include the following trigger parameters: ammonia, phosphorus, dissolved organic carbon, nitrate, iron, manganese, alkalinity and E. coli.

Ammonia, phosphorus, dissolved organic carbon; nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants to the subsurface.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Shallow Unconfined Aquifer

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the shallow unconfined aquifer. The trigger levels are based on the 95% UTLs for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	4.0 mg/L
Phosphorus	7.2 mg/L
Dissolved Organic Carbon	34.6 mg/L
Nitrate	1.3 mg/L
Iron	48.3 mg/L
Manganese	17.1 mg/L
Alkalinity	633 mg/L
E. coli	25.6 CFU/100mL

Deep Bedrock Unit

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the bedrock aquifer. As an alternative, 95% UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations.

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the bedrock aquifer. The trigger levels are based on the 95% (UTL) for upgradient (TW-7) groundwater data in the bedrock aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	0.2 mg/L
Phosphorus	0.5 mg/L
Dissolved Organic Carbon	18.4 mg/L
Nitrate	0.5 mg/L
Iron	10.6 mg/L
Manganese	2.1 mg/L
Alkalinity	996 mg/L
E. coli	5.0 CFU/100mL

A pumping test completed in 2008 within the deep bedrock unit as part of the Phase II ESA confirmed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. For this reason, any exceedances of the above-referenced trigger levels for the deep bedrock unit should be reviewed in conjunction with other monitoring data to assess whether or not the exceedances are related to Facility operations. It is unlikely that Facility operations will affect deep bedrock unit water quality.

Trigger level program - Tiers

The TLP should be implemented using a series of three Tiers to verify the results and direct potential contingency implementation. The following paragraphs describe the three Tiers recommended to be included as part of the TLP.

Tier I – Routine Monitoring and Trigger Locations

Tier I monitoring involves the sampling of all on-Site groundwater monitoring wells at the frequency prescribed in the Site environmental monitoring program. All groundwater monitoring activities completed at the Site will be considered Tier I monitoring unless two or more trigger parameters exceed their respective trigger levels in a single sample.

Groundwater monitoring will be conducted at the Site, as follows:

- Tri-annually (three times per year) at MW101-13, MW102-09, MW104-13, MW105-09, MW5-09, MW106-15*
- Semi-annually (twice per year) at all remaining overburden and bedrock monitoring wells, respectively MW1-08, MW2-08, MW3-08, MW4-09, and MW103-09

*-Not yet installed

Tier II – Confirmation Monitoring

If during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring program will be implemented. The Tier II Confirmation Monitoring program consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next scheduled monitoring event in order to confirm the Tier I exceedance of the two or more trigger parameters. If the concentrations reported in the duplicate samples return to below their respective trigger levels, then Tier I monitoring will resume.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

The comparison of the observed water quality to generic criteria, the applicable regulatory compliance framework, the pre-existing water quality, and downgradient use of groundwater will dictate the timing and urgency of response. The comparison should also include parameter trend analyses over time and the contributions of sources of impact other than the Facility. If the Tier II Confirmation Monitoring program and subsequent evaluation indicate that Facility operations are having a detrimental effect on water quality migrating off-Site, then Tier III - Contingency Measures will be implemented.

Tier III – Contingency Measures and Compliance Monitoring

The Tier III portion of the TLP involves assessment and implementation of contingency measures in the event of imminent off-Site groundwater quality impairment. Contingency measures to be evaluated would include extraction of impacted groundwater and/or surface water for on-Site treatment or off-Site disposal, or acquisition of groundwater rights and registration of a contaminant attenuation zone on title of adjacent lands.

Tier III also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented. The Tier III compliance monitoring program details would be determined in conjunction with the development and implementation of preferred contingency measure(s). The compliance monitoring parameters, locations and monitoring frequency would be determined at the time of implementation of contingency measures.

Appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed. As the nature of potential future water quality issues cannot be known in advance, it is not practical to develop remediation plans that will necessarily best suit the particular situation in the event of water quality impairment.

4.0 Closing

It is recognized that using pre-existing water quality data as the basis for the groundwater trigger level program will not necessarily provide an effective measure of the potential for off-Site migration of adverse water quality, as it relates to adjacent water uses. For this reason, it is necessary that evaluations of water quality included within the Annual Monitoring Reports take into consideration the potential for impairment of downgradient water quality uses, regardless of the nature of the source of the impact (off-Site sources, Facility operations, historical impacts, etc.).

As such, evaluations of the shallow unconfined aquifer should compare water quality adjacent to surface water courses to the Provincial Water Quality Objectives (PWQOs) to assess the potential effects of shallow groundwater discharging to surface. Evaluations of deep bedrock groundwater should compare water quality to the Ontario Drinking Water Quality Standards (ODWQSs).

MEMORANDUM

January 3, 2017

TO: Kyle Straberger
Senior Environmental Officer
Peterborough District Office
Eastern Region

MINISTRY OF THE ENVIRONMENT
JAN 11 2017
OTTAWA

FROM: Bob Holland
Hydrogeologist
Water Resources Unit
Technical Support Section
Eastern Region

RE: Orgaworld Organics Facility
2015 Groundwater and Surface Water Monitoring Report
Trigger Level Program
5123 Hawthorne Road
City of Ottawa
Hydrogeologic Assessment

I have reviewed the above noted report signed by Conestoga Rovers & Associates March 31, 2016 describing groundwater impacts related to the Orgaworld Organics Facility in Ottawa. The report also provides the Trigger Level Program (TLP) to protect groundwater from the impact of this new facility.

The consultant provides an assessment of the physical hydrogeology of the site. A shallow aquifer exists at the bedrock overburden interface. Water level monitoring has confirmed the inferred groundwater flow direction in the upper unconfined aquifer is to the east with some level of limited discharge to ditches located along the north site boundary. The Surface Water Unit should review this report as groundwater that does not meet Provincial Water Quality Objectives for ammonia may at times discharge to these ditches.

A deep aquifer exists in sandstone. Based on in-situ hydraulic testing the consultant has deemed there is no hydraulic connection between the deep aquifer and the unconfined shallow aquifer. Inferred groundwater flow in the deep aquifer is to the west. Contaminants of concerns identified are ammonia, iron, manganese, dissolved organic carbon, sulfate, and total dissolved solids. Groundwater quality mapping of ammonia, DOC, iron and manganese confirm that a plume extends in the shallow aquifer northeastward, originating in and around the northeast corner of the Organic Composting Facility. Some impacts have been detected in the deep aquifer.

A TLP has been proposed recognizing that past site activities and up gradient water quality issues exist and that an alternative method has been developed to assess the net impact of this new facility, bearing in mind that groundwater impairment must not occur. I have reviewed the proposed TLP and find it is acceptable to me.

I find the monitoring program rationalization acceptable to me.

In general, I agree with the conclusion and recommendations made by the consultant. Current remediation efforts must continue to improve groundwater quality at all down gradient monitoring wells relative to facility start up and any additional work as per the TLP. If a Tier III trigger is reached I should be consulted.

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/27	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Proposed Monitoring Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline the proposed groundwater and surface water monitoring programs for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Site) located at 5123 Hawthorne Road, Ottawa, Ontario. This memorandum has been prepared in support of an application to amend ECA No. 9465-7NVRWT (Industrial Sewage Works). The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

1.1 Current Monitoring Program

The current monitoring program for the Site is defined in the above-referenced ECA and includes hydraulic monitoring and sampling at 11 groundwater monitoring well locations within the shallow unconfined aquifer and 3 groundwater monitoring wells in the deep bedrock aquifer unit. The monitoring program also includes sampling at 4 surface water locations. The following locations are currently sampled on a semi-annual basis (twice per year):

Unconfined Shallow Aquifer	*Deep Bedrock Aquifer*	*Surface Water*
MW1-08	TW-4	SW-1
MW2-08	TW-7	SW-2
MW3-08	TW-8	SW-3
MW4-08		SW-4
MW4-09		

ISO 9001

The following locations are sampled on a quarterly basis.

Unconfined Shallow Aquifer
MW5-09
MW101-13
MW102-09
MW103-09
MW104-13
MW105-13

The current analytical parameter list for the Site, as per the Site's Environmental Compliance Approval (ECA No. 7251-8GKRPD, as amended) consists of selected general chemistry, bacteriologic components, metals, petroleum hydrocarbons (PHCs), and polycyclic aromatic hydrocarbons (PAHs).

A complete summary of the current monitoring program is provided in Table 1.

2.0 Proposed Monitoring Program

Based on the results of monitoring completed to date, there is sufficient data collected to warrant reductions in the monitoring program. The reductions in monitoring include changes in monitoring frequency at selected locations and removal of several analytical parameters from the list of analytes. The following sections discuss the proposed changes to the monitoring program.

2.1 Monitoring Frequency

A significant amount of monitoring data has been collected to date for the on-Site monitoring wells. The monitoring data has allowed for a comprehensive understanding of the spatial and temporal patterns in groundwater quality. As groundwater quality is generally well understood, it is recommended that monitoring frequency be reduced at selected locations.

During recent monitoring years, field staff has been unable to complete the winter monitoring event during February due to frozen monitoring wells. For this reason, it is recommended that the winter (February) monitoring event be removed from the monitoring program. Three monitoring events (spring, summer, and fall) should be maintained per year at locations where detailed groundwater monitoring is suitable.

The following table summarizes the recommended groundwater monitoring frequency.

Location	*Current Sampling Frequency*	*Proposed Sampling Frequency*	*Unit*	*Trigger Well*
MW101-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW102-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW103-09	Quarterly	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW1-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW2-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW3-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW4-09	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW5-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW104-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW105-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW106-15	NA	Tri-Annual	Unconfined Shallow Aquifer	Yes
EW107*	NA	Tri-Annual	Unconfined Shallow Aquifer	No
TW-4	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-7	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-8	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No

*- Not yet installed
+ - Upgradient well
NA – Not applicable

As indicated in the above table, the recommended changes to the monitoring program include:

- Reduction of monitoring from quarterly to tri-annual (three times per year) at selected locations
- Reduction of monitoring from quarterly to semi-annual at MW103-09. This location is located away from verified sources of impact and semi-annual monitoring will provide adequate water quality data at this location.

It should be noted that the monitoring frequency specified above is consistent with the monitoring frequency proposed in the updated TLP.

Groundwater monitoring well (MW106) and extraction well (EW107) have not yet been installed, but are scheduled for installation prior to the spring 2015 monitoring event. These wells should be incorporated into the monitoring program at the monitoring frequency specified above, following installation.

Surface water sampling is currently conducted at two upstream locations: SW1-09 and SW2-09. The analytical results have generally been consistent between these two locations. As there are no Site-related sources of impact between SW-1 and SW-2, it is recommended that sampling at SW-1 be discontinued. As such, surface water quality monitoring should continue semi-annually at locations SW2-09 and SW3-09. SW4-09 should continue to be sampled on a monthly basis (when weather conditions permit safe sampling at this location).

2.2 Monitoring Parameters

The existing monitoring program includes sampling of groundwater and surface water for PHC and PAH parameters. The results of PHC and PAH analyses have demonstrated largely non-detect results for the majority of these parameter lists. The sporadic detections of PHCs or PAH parameters have been inconsistent and at very low concentrations often just above the detection limits. In addition, similar infrequent low-level detections have also been reported at background monitoring locations. Therefore, it is likely that any detection of PHCs or PAHs parameters are the result of background conditions and/or related to fill materials historically used in the vicinity of the Site. Thus, PHCs and PAHs are not considered useful in evaluating groundwater and surface water for potential environmental impacts related to Site operations.

It is recommended that PHCs and PAHs be removed from the current monitoring parameter list.

The recommended monitoring program for the Site is summarized in Table 2.

MEMORANDUM

TO:	Ministry of the Environment	REF. NO.:	045804-22
FROM:	Ben Kempel/Ben Constable/mg/25	DATE:	July 16, 2014
CC:	Tej Gidda, Ron Cherkewski, Mike Rooke		
RE:	**Groundwater Assessment and Work Plan - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates (CRA) has prepared this memorandum on behalf of Orgaworld Canada Ltd. (Orgaworld) to provide the Ministry of Environment (MOE) with the results of supplementary data assessment completed on groundwater monitoring data for the Orgaworld organic waste processing facility (Facility) located at 5123 Hawthorne Road, Ottawa, Ontario (Site). The assessment has been undertaken in response to identified increases in ammonia concentrations within shallow groundwater downgradient of the Facility. The assessment has focused on monitoring data for the most recent (2013) monitoring period and included the following activities:

- 2013 Data Assessment – Ammonia (Section 2.0)
- Additional Parameters of Concern (Section 3.0)
- Groundwater Discharge to Surface (Section 4.0)
- Data Gap Analysis (Section 5.0)

CRA has prepared a work plan for further investigating and characterizing groundwater at the Site. The purpose of the additional investigation is to refine the ammonia plume delineation, improve understanding of the aquifer properties on-Site, and determine the potential receptors associated with the plume.

Orgaworld currently operates under the following Environmental Compliance Approvals (ECA's) for the Site:

- Number 7021-7HQNDE (Air), September 16, 2009
- Number 9465-7NVRWT (Industrial Sewage Works), September 16, 2009
- Number 7032-88XPRA (Industrial Sewage Works), Amended September 7, 2010
- Number 7251-8GKRPD (Industrial Sewage Works), Amended May 30, 2011
- Number 2766-7HEPSZ (Waste Disposal Site), September 16, 2009, Amended under Notice No. 1, October 21, 2010

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

Condition 9 (8) of ECA Number 7251-8GKRPD requires that Orgaworld establish a comprehensive Compliance and Trigger Level Monitoring Program based on groundwater monitoring within two years of operations. The Compliance and Trigger Level Monitoring Program is to be submitted to the MOE along with an application to amend the ECA. Orgaworld has not applied to amend the ECA, as the monitoring data gathered since 2010 to define baseline conditions for the site has been influenced by both existing conditions at the Site, largely comprised of historical fill materials and adjacent to quarrying activities, and potentially the Facility's operations. This work plan has been specifically designed to present results and interpretation of the historical and current data and to define steps moving ahead to address groundwater quality.

The following sections discuss the results of the assessment and describe the proposed work plan.

2.0 2013 Data Assessment - Ammonia

Interpretations of pre-2013 analytical data identified the existence of an ammonia plume within shallow groundwater originating near the eastern side of the organics composting facility and migrating to the northeast towards the Site boundary. Elevated concentrations of ammonia were originally reported in historic monitoring well MW101-09 in May 2010. Elevated ammonia concentrations were detected in monitoring wells located downgradient of MW101-09 during subsequent monitoring events. Ammonia concentrations were observed to increase within the interpreted source area (MW101-09) and downgradient Site boundary monitoring wells (MW5-09, MW102-09) through 2012. Based on a review of 2013 data, elevated ammonia concentrations are persistent within the source area and concentrations continued to increase through 2013 at the downgradient monitoring wells. The Site groundwater monitoring network is illustrated on the attached Site Plan (Figure 1).

Monitoring well MW101-09 was abandoned during 2012 due to suspicions that the well integrity may have been compromised. In addition, several new monitoring wells were installed near the interpreted source area in early 2013. The analytical results from the initial year of sampling at MW101-13 and MW104-13 confirm that elevated concentrations of ammonia exist immediately downgradient of former historic monitoring well MW101-09. The analytical results from MW105-13 show that the elevated concentrations of ammonia are also present to the northeast of MW101-09.

Figures 2 through 7 illustrate ammonia concentrations versus time for the monitoring wells within the source area and downgradient along the Site boundary. As depicted in the Figures, ammonia concentrations have demonstrated increasing trends at monitoring wells MW104-13, MW5-09, MW102-09, and MW101-13.

3.0 Additional Parameters of Concern

A comparison of the 2012 through 2013 analytical data for downgradient monitoring wells (MW5-09, MW102-09, MW1-08) located along the northern Property boundary to the Ontario Drinking Water Standards (ODWS) and upgradient water quality at MW3-08 was completed to identify additional parameters of potential environmental concern within shallow groundwater. Based on this comparison,

several general chemistry and metals parameters have been reported at concentrations above their respective ODWS criteria, and significantly elevated above upgradient levels. The following additional parameters have been identified as potential parameters of concern. The maximum reported downgradient, Site boundary concentrations and respective ODWS criteria (in brackets) are as follows:

- Iron – 7.5 mg/L (0.3 mg/L)
- Manganese – 4.8 mg/L (0.05 mg/L)
- Dissolved Organic Carbon – 12.1 mg/L (10 mg/L)
- Sulfate – 872 mg/L (200 mg/L)
- Total Dissolved Solids – 2030 mg/L (500 mg/L)

It should be noted that, similar to the trend noted for ammonia, the concentrations of the above parameters have generally demonstrated increasing trends during recent years at monitoring wells immediately downgradient of the Facility.

Figures 8 through 11 provide concentration isopleths for ammonia, dissolved organic carbon (DOC), dissolved iron, and dissolved manganese based on the median sample results from 2013 monitoring in monitoring wells completed within the shallow aquifer. Each figure illustrates the presence of elevated concentrations in the interpreted source area and downgradient towards the northern Site boundary. Elevated concentrations of iron, manganese, DOC and TDS are consistent with the interpretation that the contaminant plume is related to an organic contaminant source. As indicated on these figures, there is little known about the western extent of the plume near the northern Site boundary. The proposed work plan for addressing this data gap is discussed in Section 5.3.

4.0 Groundwater Discharge to Surface

The presence of elevated ammonia concentrations within shallow groundwater is primarily a potential concern with respect to the discharge of shallow groundwater to surface water, due to the relatively low Provincial Water Quality Objective (PWQO) for un-ionized ammonia (0.02 mg/L). As such, it is recommended that the hydraulic relationship between shallow groundwater and surface water be investigated through the installation of staff gauges and measurement of static water levels in both shallow groundwater and surface water. The work plan for addressing this investigation is discussed in Section 5.3.

5.0 Data Gap-Analysis

There is sufficient evidence to confirm that a plume exists on-Site within the shallow groundwater adjacent to and downgradient of the Facility. The available groundwater quality data suggests that the plume consists of organics-related contaminants with elevated concentrations of ammonia. As part of the data assessment, CRA completed a data-gap analysis to identify areas where important information is unavailable concerning the contaminant nature, distribution or fate.

The following sections discuss the identified data gaps and outline the proposed action items for addressing the data gaps. Completing these action items forms the basis of the proposed work plan.

5.1 Surface Water Levels

As discussed previously, elevated ammonia concentrations within groundwater can be an issue of environmental concern when groundwater discharges to surface water, as the PWQO for un-ionized ammonia is low (0.02 mg/L). As such, it is important to understand whether or not shallow groundwater discharges to surface water at the Site to determine if the elevated ammonia concentrations are entering the surface water regime.

The comparison of shallow groundwater elevations with adjacent/nearby surface water elevations during quarterly monitoring events will determine whether or not groundwater is discharging to surface. As such, a series of staff gauges will be installed within the ditch along the north side of the Site (and any other on-Site surface water features, as appropriate). These staff gauges will be surveyed for geodetic reference. Surface water elevation measurements will then be incorporated into the monitoring program during each monitoring event. These measurements will be completed for a minimum of one year in order to observe the shallow groundwater - surface water relationship in different seasons.

Recommendations concerning the potential continuation of monitoring in the ditch will be made following one year of monitoring.

5.2 Complete Topographic Site Survey

It is understood that an as-built topographical survey of the site is unavailable. Accurate comparison of ground water levels to site grades is needed to verify if groundwater is discharging to the Site's surface water bodies. As such, an up to date topographical survey will be completed so this interface can be accurately assessed. The topographic survey will also be used to verify the pond levels and the outflow levels from the site into the Hawthorne Industrial Park.

5.3 Additional Monitoring Data

Groundwater

Although the current monitoring network has adequately identified the presence of an ammonia plume, the western extent of the contaminant plume along the northern Site boundary is currently unknown. Therefore, a shallow groundwater monitoring well will be installed to the west of MW5-09, as indicated on Figure 1 to better define the western extent of the plume. The proposed monitoring well will be incorporated into the regular monitoring program for quarterly sampling until sufficient data is gathered to warrant a monitoring reduction.

Surface Water

As discussed in Section 5.1, four (4) surface water staff gauges will be installed within the ditch along the north end of the Site in order to measure water levels within the ditch. The staff gauges will be geodetically surveyed so that measured water levels can be converted into static elevations. These static

elevations will be compared to the static groundwater elevations in adjacent groundwater monitoring wells to determine if shallow groundwater is discharging to this ditch. The proposed surface water staff gauge locations are illustrated on Figure 1.

5.4 Hydraulic Testing

In order to have a thorough understanding of the hydraulic characteristics of the shallow overburden and bedrock aquifers, additional testing of the aquifer properties will be completed along the northern Site boundary. This testing will be accomplished through single well response tests on the existing and proposed shallow groundwater monitoring wells in this area (MW5-09, MW102-09 and the proposed monitoring well).

The results of this testing will be used to better estimate the aquifer properties along the northern Site boundary.

6.0 Groundwater Remediation

In response to the identified groundwater plume, a single shallow groundwater extraction well will be installed near the ammonia scrubber. Based on the nature of the contaminants observed, the contaminant distribution and the interpreted source of leakage, the area immediately downgradient of the ammonia scrubber is considered the most suitable location for a remediation/extraction well.

The purpose of the extraction well will be to remove the most heavily impacted groundwater from the subsurface for use in the Facility process. Up to 15,000 L of groundwater can be used in the process daily. As such, this source removal strategy represents an ideal opportunity to control a significant portion of the plume without the need for treatment or trucking to a disposal facility.

7.0 Closing

It is anticipated that the installation of an additional monitoring well, a remediation/extraction well and establishment of surface water staff gauges will occur during the summer of 2014. The monitoring points will be incorporated into the regular monitoring program during the next regularly scheduled monitoring event.

The results of the above-described work program, including recommendations for next steps, will be provided to the MOE in a letter report following completion of the assessment.

We trust this to be complete and in order for your use. Should you have any questions, please do not hesitate to contact our office.

Map of Well Location

Please provide a map below following instructions on the back.

Comments:

Well Contractor and Well Technician Information

Business Name of Well Contractor	Well Contractor's Licence No.
Capital Water Supply Ltd.	1558

Business Address (Street Number/Name)	Municipality
Box 490	Stittsville

Province	Postal Code	Business E-mail Address
Ontario	K2S1A6	office@capitalwater.ca

Bus. Telephone No. (inc. area code)	Name of Well Technician (Last Name, First Name)
6138361765	Miller, Stephen

Well Technician's Licence No.	Signature of Technician and/or Contractor	Date Submitted
0097		2008/09/26

Well owner's information package delivered	Date Package Delivered	Minister's Work
☐ Yes ☒ No	2008/09/26	Audit No. Z 084110
	Date Work Completed: 2008/09/26	Received

0506E (12/2007) Contractor's Copy

Memorandum

February 22, 2018

To:	Ben Kempel, Trevor Saunders, Airesse MacPhee	Ref. No.:	045804-58
From:	Pascal Renella/al/9		514-339-0758

Subject: Data Quality Assessment and Validation

Laboratory:	ALS Canada Ltd	Date(s) Sampled:	May 30 – November 30, 2017
Lab Job No.:	L1933863, L1935461, L1936074, L1984427, L2029238, L2029244, L2029749		
Sampled By:	Trevor Saunders		
Media Sampled:	Groundwater, Surface Water		

QA/QC	Criteria	Pass	Qualifiers	Fail	N/A
Holding Times	Analyte specific	☒	☐	☐	☐
Field Duplicate (blind)	Matrix specific	☐	☒	☐	☐
Field Blank (blind)	Non-detect	☐	☒	☐	☐
Trip Blank	Non-detect	☐	☐	☐	☒
Temperature	Analyte specific	☐	☒	☐	☐
Lab QA/QC	Within standard recoveries	☒	☐	☐	☐
Data OK for Use	Yes ☐ With Qualifiers ☒ No ☐	Initial: PR			

The following results are qualified due to high temperature (13.4°C) upon arrival at the laboratory the day after sampling:

Lab Sample ID	Client Sample ID	Analyte	Result	Qualifier	Units
L1984427	GW-45804-083017-TS-001	Alkalinity, total (as CaCO3)	543	J	mg/L

MEMORANDUM

TO:	Ministry of the Environment	REF. NO.:	045804-22
FROM:	Ben Kempel/Ben Constable/mg/25	DATE:	July 16, 2014
CC:	Tej Gidda, Ron Cherkewski, Mike Rooke		
RE:	**Groundwater Assessment and Work Plan - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates (CRA) has prepared this memorandum on behalf of Orgaworld Canada Ltd. (Orgaworld) to provide the Ministry of Environment (MOE) with the results of supplementary data assessment completed on groundwater monitoring data for the Orgaworld organic waste processing facility (Facility) located at 5123 Hawthorne Road, Ottawa, Ontario (Site). The assessment has been undertaken in response to identified increases in ammonia concentrations within shallow groundwater downgradient of the Facility. The assessment has focused on monitoring data for the most recent (2013) monitoring period and included the following activities:

- 2013 Data Assessment – Ammonia (Section 2.0)
- Additional Parameters of Concern (Section 3.0)
- Groundwater Discharge to Surface (Section 4.0)
- Data Gap Analysis (Section 5.0)

CRA has prepared a work plan for further investigating and characterizing groundwater at the Site. The purpose of the additional investigation is to refine the ammonia plume delineation, improve understanding of the aquifer properties on-Site, and determine the potential receptors associated with the plume.

Orgaworld currently operates under the following Environmental Compliance Approvals (ECA's) for the Site:

- Number 7021-7HQNDE (Air), September 16, 2009
- Number 9465-7NVRWT (Industrial Sewage Works), September 16, 2009
- Number 7032-88XPRA (Industrial Sewage Works), Amended September 7, 2010
- Number 7251-8GKRPD (Industrial Sewage Works), Amended May 30, 2011
- Number 2766-7HEPSZ (Waste Disposal Site), September 16, 2009, Amended under Notice No. 1, October 21, 2010

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

Condition 9 (8) of ECA Number 7251-8GKRPD requires that Orgaworld establish a comprehensive Compliance and Trigger Level Monitoring Program based on groundwater monitoring within two years of operations. The Compliance and Trigger Level Monitoring Program is to be submitted to the MOE along with an application to amend the ECA. Orgaworld has not applied to amend the ECA, as the monitoring data gathered since 2010 to define baseline conditions for the site has been influenced by both existing conditions at the Site, largely comprised of historical fill materials and adjacent to quarrying activities, and potentially the Facility's operations. This work plan has been specifically designed to present results and interpretation of the historical and current data and to define steps moving ahead to address groundwater quality.

The following sections discuss the results of the assessment and describe the proposed work plan.

2.0 2013 Data Assessment - Ammonia

Interpretations of pre-2013 analytical data identified the existence of an ammonia plume within shallow groundwater originating near the eastern side of the organics composting facility and migrating to the northeast towards the Site boundary. Elevated concentrations of ammonia were originally reported in historic monitoring well MW101-09 in May 2010. Elevated ammonia concentrations were detected in monitoring wells located downgradient of MW101-09 during subsequent monitoring events. Ammonia concentrations were observed to increase within the interpreted source area (MW101-09) and downgradient Site boundary monitoring wells (MW5-09, MW102-09) through 2012. Based on a review of 2013 data, elevated ammonia concentrations are persistent within the source area and concentrations continued to increase through 2013 at the downgradient monitoring wells. The Site groundwater monitoring network is illustrated on the attached Site Plan (Figure 1).

Monitoring well MW101-09 was abandoned during 2012 due to suspicions that the well integrity may have been compromised. In addition, several new monitoring wells were installed near the interpreted source area in early 2013. The analytical results from the initial year of sampling at MW101-13 and MW104-13 confirm that elevated concentrations of ammonia exist immediately downgradient of former historic monitoring well MW101-09. The analytical results from MW105-13 show that the elevated concentrations of ammonia are also present to the northeast of MW101-09.

Figures 2 through 7 illustrate ammonia concentrations versus time for the monitoring wells within the source area and downgradient along the Site boundary. As depicted in the Figures, ammonia concentrations have demonstrated increasing trends at monitoring wells MW104-13, MW5-09, MW102-09, and MW101-13.

3.0 Additional Parameters of Concern

A comparison of the 2012 through 2013 analytical data for downgradient monitoring wells (MW5-09, MW102-09, MW1-08) located along the northern Property boundary to the Ontario Drinking Water Standards (ODWS) and upgradient water quality at MW3-08 was completed to identify additional parameters of potential environmental concern within shallow groundwater. Based on this comparison,

several general chemistry and metals parameters have been reported at concentrations above their respective ODWS criteria, and significantly elevated above upgradient levels. The following additional parameters have been identified as potential parameters of concern. The maximum reported downgradient, Site boundary concentrations and respective ODWS criteria (in brackets) are as follows:

- Iron – 7.5 mg/L (0.3 mg/L)
- Manganese – 4.8 mg/L (0.05 mg/L)
- Dissolved Organic Carbon – 12.1 mg/L (10 mg/L)
- Sulfate – 872 mg/L (200 mg/L)
- Total Dissolved Solids – 2030 mg/L (500 mg/L)

It should be noted that, similar to the trend noted for ammonia, the concentrations of the above parameters have generally demonstrated increasing trends during recent years at monitoring wells immediately downgradient of the Facility.

Figures 8 through 11 provide concentration isopleths for ammonia, dissolved organic carbon (DOC), dissolved iron, and dissolved manganese based on the median sample results from 2013 monitoring in monitoring wells completed within the shallow aquifer. Each figure illustrates the presence of elevated concentrations in the interpreted source area and downgradient towards the northern Site boundary. Elevated concentrations of iron, manganese, DOC and TDS are consistent with the interpretation that the contaminant plume is related to an organic contaminant source. As indicated on these figures, there is little known about the western extent of the plume near the northern Site boundary. The proposed work plan for addressing this data gap is discussed in Section 5.3.

4.0 Groundwater Discharge to Surface

The presence of elevated ammonia concentrations within shallow groundwater is primarily a potential concern with respect to the discharge of shallow groundwater to surface water, due to the relatively low Provincial Water Quality Objective (PWQO) for un-ionized ammonia (0.02 mg/L). As such, it is recommended that the hydraulic relationship between shallow groundwater and surface water be investigated through the installation of staff gauges and measurement of static water levels in both shallow groundwater and surface water. The work plan for addressing this investigation is discussed in Section 5.3.

5.0 Data Gap-Analysis

There is sufficient evidence to confirm that a plume exists on-Site within the shallow groundwater adjacent to and downgradient of the Facility. The available groundwater quality data suggests that the plume consists of organics-related contaminants with elevated concentrations of ammonia. As part of the data assessment, CRA completed a data-gap analysis to identify areas where important information is unavailable concerning the contaminant nature, distribution or fate.

The following sections discuss the identified data gaps and outline the proposed action items for addressing the data gaps. Completing these action items forms the basis of the proposed work plan.

5.1 Surface Water Levels

As discussed previously, elevated ammonia concentrations within groundwater can be an issue of environmental concern when groundwater discharges to surface water, as the PWQO for un-ionized ammonia is low (0.02 mg/L). As such, it is important to understand whether or not shallow groundwater discharges to surface water at the Site to determine if the elevated ammonia concentrations are entering the surface water regime.

The comparison of shallow groundwater elevations with adjacent/nearby surface water elevations during quarterly monitoring events will determine whether or not groundwater is discharging to surface. As such, a series of staff gauges will be installed within the ditch along the north side of the Site (and any other on-Site surface water features, as appropriate). These staff gauges will be surveyed for geodetic reference. Surface water elevation measurements will then be incorporated into the monitoring program during each monitoring event. These measurements will be completed for a minimum of one year in order to observe the shallow groundwater - surface water relationship in different seasons.

Recommendations concerning the potential continuation of monitoring in the ditch will be made following one year of monitoring.

5.2 Complete Topographic Site Survey

It is understood that an as-built topographical survey of the site is unavailable. Accurate comparison of ground water levels to site grades is needed to verify if groundwater is discharging to the Site's surface water bodies. As such, an up to date topographical survey will be completed so this interface can be accurately assessed. The topographic survey will also be used to verify the pond levels and the outflow levels from the site into the Hawthorne Industrial Park.

5.3 Additional Monitoring Data

Groundwater

Although the current monitoring network has adequately identified the presence of an ammonia plume, the western extent of the contaminant plume along the northern Site boundary is currently unknown. Therefore, a shallow groundwater monitoring well will be installed to the west of MW5-09, as indicated on Figure 1 to better define the western extent of the plume. The proposed monitoring well will be incorporated into the regular monitoring program for quarterly sampling until sufficient data is gathered to warrant a monitoring reduction.

Surface Water

As discussed in Section 5.1, four (4) surface water staff gauges will be installed within the ditch along the north end of the Site in order to measure water levels within the ditch. The staff gauges will be geodetically surveyed so that measured water levels can be converted into static elevations. These static

elevations will be compared to the static groundwater elevations in adjacent groundwater monitoring wells to determine if shallow groundwater is discharging to this ditch. The proposed surface water staff gauge locations are illustrated on Figure 1.

5.4 Hydraulic Testing

In order to have a thorough understanding of the hydraulic characteristics of the shallow overburden and bedrock aquifers, additional testing of the aquifer properties will be completed along the northern Site boundary. This testing will be accomplished through single well response tests on the existing and proposed shallow groundwater monitoring wells in this area (MW5-09, MW102-09 and the proposed monitoring well).

The results of this testing will be used to better estimate the aquifer properties along the northern Site boundary.

6.0 Groundwater Remediation

In response to the identified groundwater plume, a single shallow groundwater extraction well will be installed near the ammonia scrubber. Based on the nature of the contaminants observed, the contaminant distribution and the interpreted source of leakage, the area immediately downgradient of the ammonia scrubber is considered the most suitable location for a remediation/extraction well.

The purpose of the extraction well will be to remove the most heavily impacted groundwater from the subsurface for use in the Facility process. Up to 15,000 L of groundwater can be used in the process daily. As such, this source removal strategy represents an ideal opportunity to control a significant portion of the plume without the need for treatment or trucking to a disposal facility.

7.0 Closing

It is anticipated that the installation of an additional monitoring well, a remediation/extraction well and establishment of surface water staff gauges will occur during the summer of 2014. The monitoring points will be incorporated into the regular monitoring program during the next regularly scheduled monitoring event.

The results of the above-described work program, including recommendations for next steps, will be provided to the MOE in a letter report following completion of the assessment.

We trust this to be complete and in order for your use. Should you have any questions, please do not hesitate to contact our office.

1. Introduction

GHD Ltd. (formerly Conestoga-Rovers & Associates [CRA]) was retained by Orgaworld Canada Ltd. (Orgaworld) to conduct a Groundwater and Surface Water Monitoring Program (Monitoring Program) at the Orgaworld Source Separated Organics (SSO) Processing Facility (Facility) located at 5123 Hawthorne Road in Ottawa, Ontario (Site).

A Site location map is provided on Figure 1.1.

The 2016 Monitoring Program was completed in general accordance with the scope of work outlined in the June 25, 2009 correspondence to the Ministry of the Environment and Climate Change (MOECC) under MOECC reference number 4852-7KEQ29, and as required under the Facility's Industrial Sewage Works Environmental Compliance Approval (No. 7251-8GKRPD), as amended on May 30, 2011 (herein referred to as the ECA). A copy of the Facility's ECA is provided as Appendix A which is included on the CD at the end of this report. Please note that all Appendices are included on the CD.

The purpose of the Monitoring Program is to assess the potential for activities conducted at the Site to adversely affect the surrounding surface water and groundwater quality, in accordance with the ECA.

1.1 Site Background

The Site consists of an area of approximately 10-hectares that is located within an industrial development area. The area, known as the Hawthorne Industrial Park, occupies a surface area of approximately 80-hectares (referred to herein as the HIP subdivision) and has been developed by R.W. Tomlinson (Tomlinson) as an industrial business area. Orgaworld is a tenant of Tomlinson.

Between June and August 2008, GHD conducted Phase I and II Environmental Site Assessment (ESA) investigations for Tomlinson to determine the general suitability of the HIP subdivision lands for development as an industrial park. More specifically, the ESAs were completed to support a Site Plan Control Application for the lease and subsequent development and operation of the SSO facility in the southwest portion of the HIP (CRA, 2008a). GHD submitted the ESAs to the City of Ottawa on behalf of Orgaworld.

The 2008 groundwater monitoring/sampling activities included sampling of ten shallow aquifer wells (MW1-08 to MW10-08) and three surface water locations (SW1 to SW3). In addition, Golder Associates Ltd. (Golder) conducted a pumping test and sampling of the deep groundwater wells in August 2008 (TW-2 and TW-3) and October 2008 (TW-4 to TW-6) (Golder, 2008).

In 2009, GHD was tasked by Orgaworld to generate the Monitoring Program, based on a request from the MOECC through the process of reviewing the ECA application. In March 2010, the Monitoring Program was modified through an ECA amendment to reflect current Site conditions and monitoring well availability. Further modifications to the monitoring program were required in 2013, to reflect additional changes in the monitoring well network (replacement and addition of new monitoring wells).

Condition 9(8) of the ECA (Industrial Sewage Works No. 7251-8GKRPD) states that:

> *"the Owner shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this Certificate to the Director and the District Manager."*

In order to satisfy this condition, GHD prepared a Compliance and Trigger Level Monitoring Program (TLP) in 2014/2015. The TLP was submitted to the MOECC along with an application to amend the ECA in March 2015. The updated TLP uses a focused set of parameters and statistically based upper tolerance limits (UTLs) developed from historical data for the purpose of setting Site-specific trigger levels for the selected parameters. A complete discussion and assessment consistent with the TLP is included in Section 5.0. For reference, a copy of the memorandum sent to the MOECC that outlines the updated TLP is included in Appendix B1.

GHD prepared a Monitoring Program Rationalization (MPR) for the Site during 2015. The purpose of the MPR was to ensure that groundwater and surface water was being adequately monitored. This was accomplished through a review of the monitoring program and removal of any redundant or unnecessary monitoring. The principal recommendations of the MPR are as follows:

- Incorporate the proposed monitoring and extraction wells into the monitoring program upon installation
- Reduce monitoring from quarterly to three times per year
- Remove polycyclic aromatic hydrocarbon and petroleum hydrocarbon monitoring from the program

A copy of GHD's memorandum outlining the MPR is included in Appendix B2. The 2016 monitoring program remained largely unchanged from 2015. GHD received MOECC approval to implement the changes to the monitoring program in a memo dated January 3, 2017. The 2017 monitoring program will be amended to reflect the changes proposed in the MPR.

On February 1, 2017, the MOECC issued a revised ECA (No. 2844-9YNGZC) for the facility. The revised ECA incorporates the updated TLP submitted to the MOECC in March 2015. The previous ECA (No. 7251-8GKRPD) was in effect during the monitoring period for this report. Future monitoring reports will follow the conditions included within this revised ECA. A copy of the revised ECA is included in Appendix A.

This report presents an assessment of the groundwater and surface water quality at the Site and covers the period between January and December 2016.

1.2 Site Setting

The Site is located at the southwest corner of the HIP subdivision lands, located within the former Township of Gloucester (community of South Gloucester), which was amalgamated in January 2001 as part of the City of Ottawa. The HIP subdivision was developed by Tomlinson, and is located southeast of the Hawthorne Road and Rideau Road intersection, in the southeast area of the City of Ottawa.

The layout of the Site, commencing at the western portion of the Site off the Hawthorne Road entrance, consists of a large processing plant with a delivery/receiving area, administrative office, septic bed area, and emission stack. An asphalt skirt extends around three sides of the building, which slopes north, east, and south towards an on-Site perimeter ditch system. The on-Site perimeter ditch system drains to the storm water management (SWM) pond located at the east side of the Site (see Figure 1.2) Surface run-off from the Site generally drains to the on-Site perimeter ditch system to the on-site SWM pond where it is impounded for re-use in the Facility process or until manual release off-Site through local roadside ditches within the HIP subdivision, which discharge to a central stormwater dry pond for the HIP subdivision, and then to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River. The central and southwestern portions of the Site are unfinished and consist of exposed bedrock, gravelly sands, levelled fill material, and a few shrubs and grass scrub.

Historically, since the early 1990's, the HIP Subdivision lands have been used for the placement of inert fill from construction and demolition projects as backfill, and as a temporary storage area for precast concrete pipe and chambers. The fill placement on the HIP lands represented materials that were being progressively used for backfill/leveling operations throughout the Industrial Park. A ditch used to convey groundwater pumped from the Rideau Road Quarries (Quarry #1 and Quarry #2) and the Dibblee Quarry (all located west/southwest of the Site) has been observed along the western and northern boundaries of the HIP subdivision. This ditch eventually flows into the Findlay Creek Municipal Drain at the northeast corner of the HIP subdivision. Findlay Creek Municipal Drain is situated along the northeastern boundary of the HIP subdivision.

1.3 Site Processes

The Facility is an aerobic composting operation that is approved to receive and process organics including source separated organics (SSO), brush material, food wastes (solid or sludge), commercial waste (restaurant wastes, etc.) and other sludges. Organics are processed into an unrestricted use product (UUP) suitable for application on agricultural lands, use as potting soil, or for other similar applications. The Facility is designed to receive and process organics, to manage the resulting products and emissions, and to manage environmental impacts that are a result of the processing operations.

Storm water run-off from the Site drains to the on-Site SWM pond and is retained for use in Orgaworld's process, in accordance with the Site's ECA. If excess water is available in the SWM pond, then Orgaworld undertakes analysis and testing of the pond water. If analysis and testing show acceptable water quality, the excess stormwater is discharged into the HIP roadside ditch network.

1.4 MOECC Correspondence to Date

The correspondence below documents the communications between Orgaworld and the MOECC with regards to the application, requested amendments, and subsequent issuance of the Site's current ECA (Industrial Sewage Works) No. 7251-8GKRPD:

- Application for Approval of Industrial Sewage Works, Storm Water Management Facility, Ottawa City, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; September 19, 2008) (CRA, 2008b).
- Proposed Groundwater/Surface Water Monitoring Program, Application for Approval of Industrial Sewage Works, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, City of Ottawa, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; June 25, 2009).
- Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MOE; September 16, 2009).
- Summary of Pre-Start-up Groundwater/Surface Water Monitoring Program, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, Ottawa, Ontario (CRA; February 5, 2010a).
- Amendment Application, Deep Groundwater Monitoring Well Relocations, Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2010b).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; September 7, 2010).
- Amendment Application, New Equipment Installation, Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (CRA; March 18, 2010c).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7251-8GKRPD, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; May 30, 2011).
- Letter RE: 2012 Groundwater/Surface Water Monitoring and Compliance Report, Orgaworld Organics Facility — SWM Pond, from Ministry of the Environment Ottawa District Office (MOE, September 13, 2013).
- Memorandum RE: Groundwater Assessment and Work Plan – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; July 16, 2014).
- Memorandum RE: Recommended Compliance and Trigger Level Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 27, 2015).
- Memorandum RE: Proposed Monitoring Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 27, 2015).

- Environmental Compliance Approval – Application for Amendment (ECA No. 7251-8GKRPO), Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2015).
- Memorandum RE: Orgaworld Organics Facility 2015 Groundwater and Surface Water Monitoring Report, Trigger Level Program, 5123 Hawthorne Road, City of Ottawa- Hydrogeologic Assessment from Ministry of the Environment and Climate Change Water Resources Unit, Eastern Region (MOECC, January 3, 2017).

  Environmental Compliance Approval (Industrial Sewage Works) No. 2844-9YNGZC Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MOECC, February 1 ,2017).

1.5 Groundwater/Surface Water Monitoring Activities

In accordance with recommendations of the Groundwater/Surface Water Monitoring Program (CRA, 2009) and Amendment Application (CRA, 2010b), GHD has completed ongoing monitoring from 2009 to present.

The following monitoring activities were completed at the Site during the current monitoring period:

- February 2016 - Quarterly sampling
  - Sampling at seven shallow unconfined aquifer wells (MW5-09, MW101-13, MW102-09, MW103-09, MW104-13, MW105-13, and MW106-15)
  - Hydraulic monitoring at the remaining shallow unconfined aquifer and deep bedrock aquifer wells
  - Hydraulic monitoring of the staff gauges in the northern ditch
- May 2016 - Semi-annual sampling
  - Sampling at four surface water locations (SW1-09 to SW4-09)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
- August 2016 - Quarterly sampling
  - Sampling at seven shallow unconfined aquifer wells (MW5-09, MW101-13, MW102-09, MW103-09, MW104-13, MW105-13, and MW106-15)
  - Hydraulic monitoring at the remaining shallow unconfined aquifer and deep bedrock aquifer wells
  - Hydraulic monitoring of the staff gauges in the northern ditch
- November 2016 - Semi-annual sampling
  - Sampling at four surface water locations (SW1-09 to SW4-09)

- Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
- Sampling and hydraulic monitoring at the extraction well, EW107-15
- Hydraulic monitoring of the staff gauges in the northern ditch

2. Physical Setting

2.1 Site Geology

The Site-specific geology was determined through visual examination of the soil samples collected across the HIP subdivision lands during previous investigations and through examination of the stratigraphic logs.

A total of 19 monitoring wells and one extraction well have been completed in the shallow unconfined aquifer unit throughout the HIP subdivision, 16 of which have been completed within the limits of the Orgaworld Site.

Test wells (TW-1 to TW-6) were completed by Golder in 1993 and 2008. TW-1 through TW-6 extend into the deep bedrock aquifer unit which was identified as the Nepean bedrock formation (Golder Associates, 2008).

In May 2010, GHD oversaw the installation of two on-Site deep bedrock test wells (TW-7 and TW-8). The stratigraphic logs from GHD's monitoring wells confirmed the presence of limestone.

Ontario Geologic Survey (OGS) mapping shows the Oxford Formation (Dolostone) covers much of the Site with the March and Nepean Formations (Dolostone/Sandstone formations) exist in the Northern portions of the HIP (OGS, Map 1508A).

The geological unit intercepted at each well is summarized in the monitoring well construction details provided in Appendix C for the overburden and deep bedrock wells. Monitoring location details are provided in Table 2.1.

Examination of the stratigraphic logs prepared by GHD indicates that the geology is generally consistent across the HIP subdivision. Five main geologic units were identified across the area investigated; these units are:

- Heterogeneous fill
- Topsoil layer
- Alluvial sand and silts
- Glacial till
- Bedrock

The topography and geology observed throughout the region are remnants of glacial scour, and more recently, marine deposits with some removal by fluvial erosion. The Site is located on a former

quarry and thus filling activities have been carried out since the early 1990's which have significantly altered the local topography.

For 15 years or so prior to Facility construction, portions of the HIP subdivision have reportedly received inert fill from construction and demolition projects throughout the Ottawa area. The fill material received at the HIP subdivision was historically used to level some of the ground surface; however the southern and eastern areas have historically received very little amounts of fill.

The HIP subdivision is generally flat with the exception of the southwest corner, where there formerly existed a rock knoll, now a rock outcrop. The top of this rock outcrop is approximately 10 m higher than the surrounding grades of the HIP subdivision.

The geology and hydrogeology of the geological units identified are discussed below.

Fill

Results of borehole drilling and soil sampling investigations by GHD indicate that most of the HIP subdivision is overlain by fill material. The fill was found to be heterogeneous and generally consisted of a granular matrix (sand, silts, and gravel) with traces of construction waste (concrete, asphalt, wood, and brick), occasionally some clay, boulders, and dredged sediment. The fill material was generally observed to be in a compact and moist state.

Topsoil

The topsoil found was generally fine silty sand with organic material. It was dark brown to black in colour, and was generally loose and moist. Topsoil was found in most locations that were not used as roads. In several locations, the topsoil contained roots and wood debris.

Alluvial Sands and Silts

Underlying the fill and/or topsoil, alluvial sand and silt deposits were observed. Where encountered, these deposits were found to vary in density from loose to dense, and generally described as very moist to wet.

Glacial Till

A glacial till was encountered below the fill and/or alluvial sands and silts in the western half of the HIP subdivision. The glacial till encountered was predominately a silty sand matrix with some gravel, cobbles, and trace clay and boulders. The material was brown to grey in colour, was generally very moist to wet, and was in a compact to dense state. The glacial till was observed to be directly overlying the bedrock.

Bedrock

On a regional basis, the bedrock underlying the HIP subdivision consists predominantly of limestone, sandstone, and dolostone of the Nepean, March and Oxford Formations. Top of bedrock was observed at depths varying from surface outcrops to a depth of approximately 7.6 metres below ground surface (m bgs) at the location of MW6-08. Bedrock core extending from 1.1 to 2.6 m into the bedrock was collected from MW2-08 and MW4-08 to identify and characterize the bedrock. The bedrock at MW2-08 and MW4-08 was described as fractured grey limestone. The

bedrock was generally found to be fractured in the upper meter, where core recovery ranged from 93 to 94 percent and Rock Quality Designation (RQD) ranged from 63 to 75 percent. At depths in excess of 1 m into the bedrock, at MW2-08, the bedrock was found to be more competent with a recovery of 100 percent and a RQD of 93 percent.

2.2 Site Hydrogeology

Based on the review of information, the geological sequence observed at the HIP subdivision can be grouped into the two main hydrogeological units:

- A shallow unconfined groundwater unit (referred to as shallow unconfined aquifer) within the permeable fill, alluvial sands and silts and shallow fractured bedrock.
- A deep confined bedrock unit (referred to as the deep bedrock aquifer).

The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA, 2008a). Additional groundwater information regarding groundwater flow direction and velocity within the unconfined shallow aquifer unit is discussed in Section 4.1.

As part of GHD's Phase II ESA in 2008 (CRA, 2008a), an assessment of the connectivity between the shallow unconfined aquifer unit and the underlying deep bedrock aquifer unit was conducted by performing pumping tests at TW-1 through TW-3 in the deep bedrock aquifer unit. During the pumping test, water levels gathered from the shallow unconfined aquifer unit indicated no corresponding drawdown between the shallow and deep wells. Water levels in the deep bedrock aquifer unit lowered from 1.2 to 3.7 m during the 6-hour period. Based on the data, it was concluded that the shallow unconfined aquifer unit and the deep bedrock aquifer units are not hydraulically connected.

2.3 Surface Water and Drainage Features

Surface water run-off from the HIP subdivision generally drains through local ditches to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River.

A series of ditches within the Site drains to the on-Site SWM pond. The flow of the water from the SWM pond is controlled by a valve that outlets to a ditch which runs along the HIP subdivision internal roadway (Somme Street), towards the east through a central SWM pond, eventually out letting to Findlay Creek.

Another ditch runs along Hawthorne Road, flowing towards and eventually along Rideau Road, connecting to Findlay Creek; this ditch does not connect to the Orgaworld Site at Hawthorne Road or to Somme Street.

2.4 Groundwater Use

Water well data reviewed by GHD shows that the shallow unconfined water table unit is not locally used as a potable water source (Golder, 2008) (deemed unsuitable due to proximity to ground surface, limited saturated thickness, and low yield). The water well records indicate that the deep

bedrock aquifer test wells located in proximity of the HIP subdivision are all installed within the deep bedrock aquifer formation at depths generally at or in excess of 30 m bgs (Appendix C2). Bottled water is brought in for consumption at the Site, while water from TW-4 supplies sinks, showers, toilets, and the dishwashing machine for the Facility. As necessary, TW-4 is also used as an alternative refilling source for replenishing the fire suppression water holding tank.

3. Monitoring Program

The Site's Monitoring Program consists of the following:

- Hydraulic (water level) monitoring (in the monitoring wells, extraction well, and surface water staff gauges)
- Groundwater and surface water sample collection and analysis
- Quality Assurance/Quality Control (QA/QC) sample collection and analysis

3.1 Monitoring Network

Currently the groundwater monitoring network consists of the following monitoring wells:

- Shallow unconfined aquifer unit: twelve groundwater monitoring wells and one extraction well: MW01-08, MW2-08, MW3-08, MW4-08, MW4-09, MW5-09, MW101-13, MW102-09, MW103-09, MW104-13, MW105-13, MW106-15, and EW107-15.
- Deep bedrock aquifer unit: three monitoring wells: TW-4, TW-7, and TW-8.

Surface water quality is monitored through four surface water monitoring locations (SW1-09 to SW4-09). Surface water level monitoring in the northern ditch is monitored by the four staff gauges (SG-1 through SG-4).

Table 3.1 provides a summary of the 2016 monitoring program. A summary of the approved monitoring program for 2017 is provided in Table 3.2.

The groundwater and surface water monitoring locations within the HIP subdivision are provided on Figure 3.1. Figure 3.1 also shows the Site limits included in the Orgaworld lease and the boundary of the HIP subdivision.

Figure 3.2 shows the groundwater and surface water locations on the Orgaworld Property. Each of the newly installed locations have not been surveyed. Their approximate locations are shown on Figure 3.2.

3.2 Monitoring Protocol

3.2.1 Groundwater Monitoring

The depth to groundwater was measured using an electronic water level meter with the top of the monitoring well riser pipe as the reference point, or to the top of the steel casing for all deep bedrock aquifer monitoring wells. Groundwater elevations were subsequently calculated for each monitoring well by subtracting the depth to water measurement from the reference point elevation.

Groundwater samples were collected by following GHD's field method guideline protocols, which are consistent with MOECC requirements. All shallow aquifer monitoring wells and deep aquifer monitoring wells, except TW-8, were purged and sampled using low-flow sampling techniques with dedicated polyethylene tubing and a peristaltic pump. Wells were sampled following stabilized field readings.

During mid-2016, a dedicated sampling port was installed in the Facility to facilitate sampling from EW107-15. The sample is collected after the extraction well and sample port are purged for several minutes to ensure the sample port and associated lines are clear of stagnant water. The May 2016 sample collected from EW107-15 was collected following GHD's low-flow sampling techniques.

Due to the greater depth to groundwater, deep bedrock aquifer unit monitoring well TW-8 was sampled using low-flow methods with dedicated polyethylene tubing and a bladder pump system.

The samples collected for metals analysis were field filtered using disposable 0.45 µm in-line filters. All groundwater samples collected were submitted to ALS Environmental (ALS) of Waterloo, Ontario for analysis under standard chain-of-custody protocol. Analytical results are discussed in Section 4.0.

The analytical parameter list for groundwater is summarized in Table 3.1.

The original laboratory analytical reports are provided in Appendix D.

3.2.2 Surface Water Monitoring

Surface water samples were collected at four locations (SW1-09 to SW4-09) following GHD's field method guidelines. Surface water samples were collected by gently immersing the sample bottles in the ditch, creek or pond water, taking care not to disturb the underlying sediments. Readings for pH, conductivity, dissolved oxygen, oxidation reduction potential (ORP), turbidity, and temperature were recorded at the time of sample collection. All surface water samples were collected without field filtering and as such, represent total parameter concentrations. Potential dissolution of particulates by the acid preservative in the metals sample bottles may affect parameter results for the surface water samples. All surface water samples collected were submitted to the laboratory for analysis under standard chain-of-custody protocol. The sample parameter list for surface water sampling is the same as the parameter list for groundwater (refer to Table 3.1).

Hydraulic level monitoring is completed at four staff gauges located throughout the northern Site ditch. The depth to surface water was visually observed to be dry during 2016; however, future depth to water measurements will be made using a steel tape measure using the top of the staff gauge (a steel t-bar) as the reference point. Surface water elevations will be calculated for each staff gauge by subtracting the depth to water measurement from the reference point elevation.

3.3 Quality Assurance/Quality Control Program

A QA/QC program was undertaken as part of the Monitoring Program. This program involved the collection and analysis of field duplicate samples and the evaluation of standard laboratory quality control samples and procedures. The potential for contamination of samples through field and

laboratory procedures is monitored through the analysis of field and laboratory blanks and duplicates samples.

The quality control parameters were found to be within acceptable ranges of standard laboratory practice. Several qualifications of the 2016 analytical data were made through the QA/QC assessment.

Details of the QA/QC Assessment for the current monitoring period are provided in Appendix D. The qualifications indicated in Appendix D do not significantly alter the interpretation of the data or affect the conclusions provided in this report.

4. Monitoring Results

The results of the Monitoring Program for the current monitoring period are presented in the following sections as follows:

- Section 4.1 - Groundwater Hydraulic Monitoring
- Section 4.2 - Water Quality Monitoring

To better facilitate discussion of the water quality, the sampling points for the Monitoring Program have been divided into the following areas: shallow unconfined aquifer unit, deep bedrock aquifer unit, and surface water. Each is discussed in an upgradient to downgradient or upstream to downstream fashion.

4.1 Groundwater Hydraulic Monitoring

Groundwater elevation data collected during the current monitoring period is presented in Table 4.1. Groundwater elevations measured during the May and November 2016 monitoring events are consistent with those observed historically at the Site, and were used to develop groundwater contour figures, as presented on Figures 4.1 to 4.4. Shallow unconfined aquifer and deep bedrock aquifer groundwater elevations and contours for the May 2016 monitoring event are presented on Figures 4.1 and 4.3, respectively, and shallow unconfined aquifer and deep bedrock aquifer groundwater levels and contours for the November 2016 monitoring event are presented on Figures 4.2 and 4.4, respectively.

The shallow aquifer water table was encountered at elevations varying from 90.39 to 98.62 metres above mean sea level (m AMSL) at MW103-09 and MW3-08 during the May monitoring event and 90.00 to 98.92 m AMSL at MW103-09 and MW3-08 during the November event. Based on the groundwater elevations gathered in May and November 2016, flow occurs in an east-northeast direction in the shallow unconfined aquifer. This is consistent with previous monitoring years.

The horizontal hydraulic gradients for the shallow unconfined aquifer unit for the May and November 2016 monitoring events were estimated from groundwater contours presented on Figures 4.1 and 4.2 to be approximately 0.02 m/m across the Site. The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA 2008b). Assuming an effective porosity of 40 percent for the shallow

unconfined aquifer unit, an estimate of the groundwater flow velocity can be determined from the following equation:

$$v = \frac{Ki}{n}$$

Where:

v = groundwater flow velocity (L/T)

K = hydraulic conductivity (L/T)

i = horizontal hydraulic gradient (unitless)

n = effective porosity

Based on this equation, the local groundwater velocity in 2016 is estimated to range from a few millimeters per year to a high of approximately 6.7 m per year in the fill deposits and shallow fractured bedrock. Note that the hydraulic conductivity was estimated prior to development of the Site and may not be reflective of the current conditions at the Site.

During the 2016 monitoring period, the deep bedrock aquifer unit groundwater levels ranged from a low of82.47 m AMSL (TW-8) to high of88.86 m AMSL (TW-7). The seasonal water level fluctuation ranged from 0.56 m (TW-8) to 0.59 m (TW-4). Based on the 2016 groundwater elevations, groundwater in the deep bedrock aquifer unit flows in a west-southwest direction, which is opposite to the flow direction of the shallow unconfined aquifer unit. It is likely that the presence of a quarry to the west and southwest of the Site has influenced the groundwater flow direction within the deep bedrock aquifer unit. This is consistent with previous interpretations of groundwater flow across the Site.

Based on groundwater contours generated for the Site, hydraulic gradients for the deep aquifer unit were calculated at 0.015 and 0.014 m/m for the May and November 2016 events.

4.2 Water Quality Monitoring

The following Sections provide a discussion regarding the spatial and temporal trends of selected indicator parameters at the Site.

4.2.1 Shallow Unconfined Aquifer Unit Groundwater Quality

Groundwater flow in the shallow unconfined aquifer occurs in an east-northeast direction, as illustrated on Figures 4.1 and 4.2. According to the position relative to the Facility, the groundwater monitoring wells can be grouped as:

- Upgradient wells: MW3-08, MW4-08, and MW4-09
- Upgradient/cross gradient wells: MW2-08
- Facility Area: EW107-15, MW101-13, and MW105-13
- Downgradient: MW1-08, MW5-09, MW102-09, MW103-09, MW104-13, and MW106-15

Tabulated analytical results for the shallow unconfined aquifer from the 2016 sampling program are provided in Table 4.2.

On behalf of Orgaworld, GHD completed a Groundwater Assessment and Work Plan in July 2014 (Groundwater Assessment, Appendix B3). The Groundwater Assessment evaluated the 2013 and historical groundwater quality in order to determine appropriate parameters of concern for the Site. Previous evaluations of groundwater quality at the Site identified ammonia as the primary indicator parameter for facility-related groundwater quality impacts at the Site. The Groundwater Assessment confirmed the presence of an ammonia plume within the shallow unconfined aquifer unit, originating from the Facility.

The Groundwater Assessment also identified additional parameters of concern through a comparison of the 2013 water quality data to background water quality and the MOECC criteria listed in the Ontario Drinking Water Standards (ODWS) (MOECC, 2003, amended 2006). The comparison identified the following additional indicator parameters for identifying potential groundwater impacts from Facility operations: iron, manganese, dissolved organic carbon (DOC), sulfate, and total dissolved solids (TDS).

Ammonia and DOC are direct indicators of groundwater quality impacts associated with the discharge of organic waste related contaminants to the subsurface. Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Figures 4.5 through 4.8 provide concentration isopleths (lines of inferred equal concentration) for ammonia, dissolved iron, dissolved manganese, and DOC. The 2016 median concentrations from the shallow unconfined aquifer unit monitoring wells have been used to create the isopleths. Concentration isopleth figures are useful for evaluating and presenting spatial patterns in groundwater chemistry.

In each figure (Figures 4.5 through 4.8), the presence of elevated concentrations of each indicator parameter is identified in close proximity to or just downgradient from the Facility (i.e., at MW104-13 and various downgradient locations). The elevated concentrations appear to extend from the Facility to the east-northeast following the direction of groundwater flow. Some decrease in concentrations are observed with increased distance from the facility (following the path of groundwater flow in the shallow unconfined aquifer) and concentrations remain low to the west, south, and southeast of the Facility. Please note that because of the difference in analytical results between the spring and fall samples, the median concentrations from EW107-15 have not been included in Figures 4.5 to 4.8. Further discussion of the extraction well is provided in Section 5.0.

This distribution of elevated concentrations of ammonia, DOC, iron, and manganese is consistent with a contaminant plume related to an organic contaminant source emanating from the Facility.

The 2016 median concentrations show that elevated DOC and iron concentrations extend to MW103-09, located in the northeastern corner of the Site, but that elevated ammonia and manganese are limited to the western side of the stormwater management pond or the Northern

Ditch (in the vicinity of MW102-09). This indicates that there may be some additional source of impacts contributing to the elevated concentrations at MW103-09.

Figures 4.9.1 to 4.9.12 present the evolution of groundwater chemistry at the wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

The following tables provide summaries of the trends and concentration ranges for ammonia, DOC, iron, and manganese in the shallow unconfined aquifer:

Location	Trend	Ammonia Concentration Range (mg/L)	
		Historic (pre-2016)	**2016**
MW4-08	stable	ND(0.050) – 0.069	0.030 – 0.048
MW4-09	stable	ND(0.050) – 0.117	0.037 – 0.073
MW3-08	stable	ND(0.050) – 0.123	ND(0.020) – 0.036
MW2-08	↓	ND(0.050) – 0.105	ND(0.020) – 0.054
EW107-15	↓	8.01 – 51.3	0.123 – 14.1
MW105-13	↓	5.71 – 76.0	4.88 – 16.0/16.1
MW101-13	stable	ND(0.450) – 34.9	0.237 – 29.5
MW104-13	↓	1.93 – 14.3	1.20 – 5.41
MW5-09	↑	0.32 – 31.4	14.7 – 18.7
MW102-09	↑	ND(0.050) – 10.6	6.61 – 7.18
MW1-08	stable	0.335 – 2.08J	0.803 – 0.917
MW103-09	stable	0.508 –2.35	0.867/0.909 – 1.43
MW106-15	↓	2.90 – 10.0	1.91 – 4.79

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

As presented above, each of the upgradient locations have shown relatively stable and low ammonia levels. MW2-08 is located cross-gradient from the Facility and has shown little evidence of impacts. Ammonia concentrations at MW2-08 have remained consistently very low to non-detect.

During the 2016 reporting year, overall trends of ammonia concentrations have been decreasing particularly near the facility and downgradient. Ammonia concentrations at MW105-13 and MW101-13 previously showed increasing trends. Current analytical data indicates declining and stable trends at each facility area well. The analytical database for EW107-15 is limited; however, concentrations indicated a significant decreasing trend. Continued monitoring is required to determine/confirm the trend at the extraction well particularly during active pumping periods.

With the exception of MW5-09, and MW102-09 each of the downgradient monitoring locations continue to show overall stable or decreasing temporal trends in ammonia concentrations. MW5-09 and MW102-09 continue to exhibit elevated concentrations downgradient of the Facility and adjacent to the run-off ditches to the north the Site.

Location	Trend	Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)	
		Historic (pre-2016)	**2016**	**Historic (pre-2016)**	**2016**
MW4-08	stable and ↓	ND(0.050) – 0.320	ND(0.010) - ND(0.10)	0.0861 – 1.10	0.160 – 0.207
MW4-09	stable and ↓	ND(0.050) – 1.86	0.045 – 0.410	0.137 – 1.25	0.126 – 0.160
MW3-08	↓	ND(0.050) – 1.04	ND(0.010) - ND(0.10)	ND(0.00050)– 0.0987	ND(0.00050) – 0.0386
MW2-08	↓	ND(0.050) – ND(0.10)	ND(0.010)	0.00072 – 0.177	0.00171 – 0.00270
EW107-15	↑ and ↓	0.19 – 0.40/0.45	0.022 – 2.56	1.04 – 4.52/4.57	0.0650 – 1.01
MW105-13	↑	0.080/0.095 – 7.61	2.20 – 5.77	0.413/0.443 – 1.06	0.534/0.536 – 0.852
MW101-13	↓	ND(0.050) – 34.5	ND(0.10) – 7.07	0.0299 – 2.24	0.0114 – 1.09
MW104-13	↓	0.071 – 23.9	6.05 – 14.5	0.548 -19.4	4.01 – 8.13
MW5-09	↑ and stable	1.99 – 14.5	4.66 – 10.3	2.45 – 5.33	2.67 – 3.58
MW102-09	↓ and ↑	ND(0.010) – 24.0/24.7	4.06 – 8.02	ND(0.00050) – 5.02	2.50 -5.16
MW1-08	↓	0.897 – 16.6/17.2	6.28 – 8.11	0.539 – 10.9/11.0	1.26 – 2.09
MW103-09	↓	2.69 – 22.9/23.8	3.73/3.81 – 8.40	1.78 – 7.70/7.77	2.58 – 4.29
MW106-15	stable	1.50 – 3.09/3.20	0.838 – 4.66	1.35 – 2.44	1.06 – 2.62

Notes:
ND non-detect at the associated value

Elevated concentrations of dissolved iron and manganese are apparent in the facility area and downgradient of the facility, with the most elevated concentrations being reported at MW101-13, MW105-13, MW104-13, MW5-09, and MW102-09. This pattern is generally consistent with the patterns observed for ammonia.

Concentrations of dissolved iron and manganese show variable temporal trends downgradient of the Facility. However, with the exception of iron and manganese at MW105-13, iron at MW5-09, and manganese at MW102-09 concentrations of both parameters have continued to show an overall decreasing trend. The overall decreases are partially related to sharp drops in iron concentrations observed between May 2010 and May 2011 at several monitoring locations. Since 2011 many locations have shown relatively stable levels of dissolved iron and manganese.

Concentrations of both iron and manganese have shown variable concentrations over the past monitoring year. This is particularly evident at monitoring wells within the facility area and immediately downgradient. Continued monitoring is recommended to observe the evolution of the contaminant plume.

Location	Trend	DOC Concentration Range (mg/L)	
		Historic (pre-2016)	**2016**
MW4-08	Stable to ↓	ND(1.0) – 8.7	1.1 – 3.5
MW4-09	Stable to ↓	1.0 – 3.1	1.3 – 2.8
MW3-08	Stable	1.5 – 3.5/9.0	2.4 – 2.9
MW2-08	↑	1.5 – 10.0	5.1 – 10.0
EW107-15	↓*	10.7 – 965/1,030	3.2 – 6.3
MW105-13	Stable to ↓	2.6 – 9.3/9.4	3.8 – 5.6
MW101-13	Stable	3.6 – 14.8	4.5 – 10.4
MW104-13	↓	6.5 – 51.2	5.9 – 9.2
MW5-09	Stable	5.4 – 11.1/12.1	6.6 – 11.4
MW102-09	↓	ND(1.0) – 18.5	8.3 – 11.0
MW1-08	Stable	6.2 – 10.7	7.3 – 9.7
MW103-09	Stable	3.0/8.9 – 17.9	8.5 – 11.5
MW106-15	↑	8.0 – 12.7	9.9 – 13.0

Notes:
ND non-detect at the associated value
* Initial DOC levels in August 2015 were highly elevated. Trend will be reassessed with further data.

The current levels of DOC have remained consistent with some minor decreasing trends. Concentrations of DOC are relatively low in the upgradient monitoring wells. Monitoring wells located downgradient of the Facility had previously demonstrated trends of elevated and increasing levels of DOC. Over the past monitoring year many of the concentrations have demonstrated decreasing or stable trends. Further sampling results are needed to establish the trend at EW107-15 following the initial August 2015 results being highly elevated. The 2016 DOC levels from this location were lower than the previous year.

In general, the increases in DOC concentrations downgradient of the facility relative to upgradient concentrations are minor compared to those observed for ammonia, iron or manganese.

Shallow Groundwater to Surface Water Discharge

In comments provided by the MOECC on the 2012 annual report, the MOECC requested that a comparison of shallow groundwater quality at MW103-09 to PWQOs be completed as part of the future annual monitoring reports. Table 4.2A provides the 2016 analytical data for MW103-09 along with the PWQOs for comparative reference, with exceedances highlighted.

As indicated in Table 4.2A, several parameters exceeded their respective PWQOs at MW103-09 during the current monitoring period. The following provides a summary of those exceedances:

- Arsenic – 5 of 5 samples
- Cobalt - 1 of 5 samples
- Copper - 1 of 5 samples
- Iron – 5 of 5 samples

- Phenols – 3 of 5 samples
- Phosphorus – 3 of 5 samples
- Field Measured Dissolved Oxygen –4of4 measurements

The Groundwater Assessment included recommendations to further investigate the relationship between shallow groundwater and surface water. Recommendations included that staff gauges be installed at four points within the northern ditch system and that a topographic survey of the northern portion of the Site be undertaken.

Topographic surveying of the northern ditch system (including the ditch which drains into the SWM Pond and the ditch that continues towards Findlay Creek – the HIP Ditch) was completed and the four staff gauges were installed in early 2015; however, the geodetic surveying of the staff gauges has not been completed to date. The Site's northern ditch was dry at each of the staff gauge locations during each monitoring event in 2016, which provides some evidence that a significant volume of groundwater may not be continuously discharging to the creek.

Figure 4.10 presents the results of the topographic surveying of the northern ditch overlain by the May 17, 2016 groundwater contours. The topographic contours are provided in 0.5 m intervals with the lowest elevation presented representing the bottom of the ditch.

As shown in Figure 4.10, the topography of the ditches is 'w' shaped. The two ditch valleys or troughs travel parallel to the northern Site boundary with the on-Site ditch (that drains to the SWM Pond) found south of the HIP ditch. The inferred groundwater elevations from May 17, 2016 coincide closely with the bottom elevation of the ditches, and are above the bottom of the northern (roadside) ditch in several locations. These locations are illustrated on Figure 4.10 and are interpreted to be areas where shallow groundwater is discharging to the northern ditch. It should be noted that cattails are present in portions of this ditch providing further support to this interpretation.

Based on the shallow groundwater aquifer unit flow patterns, some groundwater elevations are above the bottom of the roadside ditch in several sections. The intersection between the groundwater and topographic contours suggests that groundwater is discharging to surface water. The presence of cattails and other hydrophyllic vegetation at the base of this ditch is indicative of groundwater discharge to the ditch.

Figure 4.10 further shows that the total area where groundwater elevations are higher than the ditch bottom increases with proximity to the pond (the fall in the ditch is greater than the drop on groundwater elevation). Therefore, groundwater is likely discharging to the ditch during periods of high groundwater levels (typically during the spring freshet). This seepage is likely to be more prevalent closer to the stormwater pond.

However, as noted above each of the staff gauge locations did not contain sufficient standing or flow water for sampling during the 2016 monitoring events. Based on the information available, the volume of groundwater seeping into the ditch is too low to maintain a consistent base flow. It is likely that groundwater seepage into the ditch is largely lost to evapotranspiration.

In conclusion, small volumes of groundwater are likely seeping to the north roadside ditch but the volumes are insufficient to form a base flow. Based on current available information, groundwater

discharging to the ditch is unlikely to cause any adverse impacts to the surface water bodies in the vicinity of the Site.

4.2.2 Deep Bedrock Aquifer Groundwater Quality

Based on the available data for the deep bedrock aquifer, groundwater flow in the deep bedrock aquifer occurs to the southwest across the Site, as illustrated on Figures 4.3 and 4.4. According to their position relative to the Facility, the deep bedrock groundwater monitoring wells can be grouped as:

- Upgradient well: TW-7
- Downgradient wells: TW-4, TW-8

The discussion regarding the evolution of the selected parameters will be applied in the same way as for the shallow unconfined aquifer.

Tabulated analytical results for the deep bedrock aquifer from the 2016 sampling program are provided in Table 4.3.

Because the deep bedrock aquifer is a potential source of drinking water in the vicinity of the Site, Table 4.3 also provides a comparison of the deep bedrock water quality to the Ontario Drinking Water Quality Standards (ODWQS) (Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, MOECC, June 2003, revised June 2006).

Table 4.3 shows that several parameters have frequently been reported above their respective ODWQS in samples collected from each of the deep bedrock wells (TW-4, TW-7, and TW-8). The following provides a summary of the parameters reported above their ODWQS limits at least once in 2016:

Location	ODWQS Exceedances	
	May 2016	November 2016
TW-7 (upgradient)	iron, manganese, total coliform bacteria, pH (field), turbidity (field and lab)	total coliform bacteria, pH (field and lab), turbidity (field and lab)
TW-4 (downgradient)	iron, manganese, alkalinity, chloride, total coliform bacteria, TDS, turbidity (lab)	manganese, alkalinity, chloride, TDS, turbidity (field and lab)
TW-8 (downgradient)	iron, manganese, ammonia, total coliform bacteria, TDS, turbidity (lab), pH (field)	total coliform bacteria, TDS, turbidity (field and lab)

ODWQS Operational Guidelines as well as the criteria for colour, temperature, and turbidity do not relate directly to water samples collected from monitoring wells. The criteria for each are included in the ODWQS as they related to the effectiveness of water treatment and are thus not relevant to samples collected from groundwater monitoring wells. Alkalinity and pH concentrations should be given consideration in the evaluation of water quality; however, the ODWQS established for these parameters are Operational Guidelines set for water treatment plant operations and are thus not directly relevant to evaluations of water quality samples from groundwater monitoring wells.

Table 4.3 shows that water quality within the deep bedrock aquifer has historically been poor. Based on the upgradient water quality from TW-7 and the surrounding land uses there are several potential upgradient sources of water quality impairments within this aquifer.

Water quality results from the both downgradient wells show that operations at the Facility are potentially degrading the already poor upgradient water quality. Figures 4.11.1 to 4.11.3 present the evolution of groundwater chemistry at the deep bedrock wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

		Ammonia Concentration Range (mg/L)		DOC Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2016)**	**2016**	**Trend**	**Historic (pre-2016)**	**2016**
TW-7	↓	ND(0.05) – 0.157	0.033 – 0.083	↓	2.8 -15.1	3.8 – 4.5
TW-4	↑ to stable	0.218 – 3.72	0.67 – 0.795	stable	4.4 – 8.0	4.8 -7.6
TW-8	stable	<0.050 – 4.60	0.057 – 0.561	↓	2.4 – 13.5	1.9 – 3.9
		Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2016)**	**2016**	**Trend**	**Historic (pre-2016)**	**2016**
TW-7	↓	0.082 – 11.1	0.199 – 1.08	↓	0.0470 – 1.71	0.0486 – 0.218
TW-4	↓	ND(0.050) – 3.30	0.025 – 0.67	↑	0.496 – 1.94	1.55 – 1.69
TW-8	↓	ND(0.050) – 6.25	ND(0.10) – 1.55	↓	0.0439 – 2.95	0.0256 – 0.434

Based on the temporal trends in 2016 (which differed little from 2015), there continues to be evidence of minor potential facility-related impacts to the deep bedrock aquifer. In particular, overall increasing trends in ammonia concentrations are apparent between 2010 and 2016 in TW-4. Concentrations of ammonia showed notable decreases in late 2014 and throughout 2016 at downgradient monitoring wells; however, the presence of ammonia at greater concentrations in downgradient wells indicates that Facility operations may be degrading water quality in the deep bedrock aquifer. Ammonia concentrations in the upgradient monitoring well have steadily remained below or near the detection limits.

A pumping test completed in 2008 showed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. In addition, recent monitoring results indicate a sharp decrease in ammonia concentrations at both downgradient deep aquifer monitoring wells. These results could be indicative of natural fluctuations or improving water quality within the deep bedrock aquifer.

It is recommended that monitoring results for downgradient deep bedrock aquifer monitoring wells continue to be reviewed and assessed for potential facility-related water quality impacts. If trends of

deteriorating water quality are consistent, consideration should be given to undertaking further investigation or evaluating the need for a remedial strategy. Based on the monitoring results from the 2016 monitoring period, no additional investigation is necessary at this time.

4.2.3 Surface Water Quality

Analytical results for surface water samples collected from the storm water management pond (SW4-09) and local ditch monitoring locations (SW1-09 through SW3-09) are presented in Table 4.4 and compared to the Provincial Water Quality Objectives (PWQO). The following table summarizes the surface water monitoring parameters that did not meet the PWQO during the 2016 sampling events.

Location	Parameter (mg/L)	PWQO	Spring	Fall
SW1-09	Molybdenum	0.04	0.230	0.276
SW1-09	Phenolics	0.001	0.0017	0.0017
SW1-09	Field pH	6.5-8.5	8.62	-
SW2-09	Iron	0.3	0.444	-
SW2-09	Phenolics	0.001	0.0018	0.0044
SW2-09	Phosphorus	0.01	0.301	0.0141
SW2-09	Field pH	6.5-8.5	9.19	-
SW3-09	Molybdenum	0.04	-	0.0515
SW3-09	Phenolics	0.001	0.0023/0.0020	0.0035
SW3-09	Phosphorus	0.01	0.0219/0.0214	0.0125
SW3-09	Field pH	6.5-8.5	9.65	-
SW4-09	Chromium	0.001	-	0.00150/0.00166
SW4-09	Iron	0.3	-	0.646/0.710
SW4-09	Phenolics	0.001	0.0022	0.0051/0.0067
SW4-09	Phosphorus	0.01	0.0627	0.215/0.234
SW4-09	Field pH	6.5-8.5	9.11	-

Notes:
0.0537/0.0653 indicates duplicate analytical results
- No exceedance for sampling event

In general, water quality at the downstream surface water monitoring location (SW3-09) is similar to the upstream surface water monitoring locations (SW1-09 and SW2-09), which indicates an upstream source impacting water quality.

Concentrations of phosphorus and total phenolics were consistently above the PWQO at each of the monitoring locations, with the exception of phosphorous at SW1-09 in 2016. In addition, sporadic elevated metals concentrations were noted at SW1-09, SW2-09, and SW3-09.

Previous assessments of the Site concluded that concentrations of un-ionized ammonia were showing increases at SW4-09. Temporal concentration versus time plots for ammonia, DOC, manganese, and iron levels at SW4-09 are presented on Figure 4.12. Figure 4.12 shows that ammonia concentrations spiked throughout 2014 and the 2016 results show a similar spike in November 2016. Iron and manganese were also elevated in the November 2016 samples. .

As discussed in Section 4.2.1, the potential for shallow groundwater to discharge to surface exists within the northern ditch and stormwater management pond. The presence of un-ionized ammonia at elevated concentrations in SW4-09 is likely related to the discharge of impacted groundwater directly to the SWP or via overland flow of impacted runoff entering the pond.

A total of 9 additional samples were collected by Orgaworld staff at surface water monitoring location SW4-09 during the 2016 monitoring period. Orgaworld staff collected monthly samples when the surface water was unfrozen. The analytical results for these samples have been included in Table 4.5 with results highlighted that did not meet their respective PWQO. As indicated in Table 4.5, parameter concentrations that did not meet their respective PWQO were noted for:

- Chromium
- Cobalt
- Escherichia Coli
- pH (Laboratory measured)
- Phenols
- Total Phosphorus
- Un-Ionized Ammonia

Water was discharged from the stormwater management pond once during the 2016 monitoring period in March. Based on the results of the surface water monitoring, there were no measureable effects on downstream surface water quality from the March 2016 discharge.

5. Shallow Groundwater Extraction System

Beginning on October 4, 2016 regular pumping from shallow groundwater extraction well EW107-15 commenced. The daily volumes pumped from EW107-15 are summarized in Table 5.1. EW107-15 is only pumped on days when the Facility is staffed and as such the total available pumping days during the period from October 4 to December 31 was 64 days. Of those available days the well was pumping on 35 days with total volume pumped of 51.19 m^3 (average 0.8 m^3/day).

As previously mentioned, EW107-15 was sampled twice during the current reporting period. The May 18, 2016 sample was collected following GHD's low-flow sampling methods. The November 2016 sample was collected via the dedicated sampling port. The following table provides a summary of the 2016 indicator parameters:

Parameter (mg/L)	May 18, 2016	November 16, 2016
Ammonia-N	0.123	14.1
Iron (dissolved)	0.022	2.56
Manganese (dissolved)	0.0650	1.01
DOC	3.2	6.3
Sulfate	304	945
TDS	673	1880

There is a notable difference in the concentrations reported in the May and November samples. Groundwater quality at the Site is seasonally variable; however, it is likely that using different sampling methods is the cause of a lot of the difference. Continued sampling is required to confirm the 2016 analytical results.

There is currently insufficient data to assess the effectiveness of the extraction well at controlling or reducing groundwater impacts at the Site. It is expected that continued operation of the shallow groundwater extraction well will, over time, remove the most heavily impacted groundwater from the facility area. This will result in improved water quality in both the facility area and downgradient plume which should, in turn, reduce the occurrence of Tier I trigger exceedances.

Future assessments of water quality (i.e., the 2017 annual report) will be used to evaluate the effectiveness of the extraction well at controlling the downgradient migration of Facility-related groundwater quality impacts.

6. Compliance and Trigger Level Program

Condition 9(3b) of the amended ECA (2011) requires the development of trigger level criteria in accordance with MOECC Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). In a memorandum to the MOECC, dated February 27, 2015, GHD provided an outline for a recommended Compliance and Trigger Level Program (TLP). A copy of the memo is included in Appendix B1. The memo provides a detailed history of developing the TLP as well as the three tiered approach to evaluating compliance at the Site.

The following Sections provide a brief summary of the key points of the TLP and an assessment of the current water quality.

6.1 Trigger Parameters

A focused set of parameters which are related to the sources of potential impacts from on-Site activities were selected for the purposes of the TLP. The TLP parameter list includes the following trigger parameters: ammonia, phosphorus, DOC, nitrate, iron, manganese, alkalinity, and Escherichia Coli. Ammonia, phosphorus, DOC, nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic sources due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

6.2 Trigger Concentrations

The following table provides the trigger levels for the above-referenced trigger parameters.

The trigger levels for the shallow unconfined aquifer are based on the 95 percent upper-tolerance limits (UTLs) for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.). More detail on how the trigger concentrations were calculated is provided in Appendix B1.

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the deep bedrock aquifer. As an alternative, 95 percent UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.).

The following table provides the trigger levels for the above-referenced trigger parameters for the shallow and deep bedrock aquifer units.

Parameter	Shallow Unconfined Aquifer Trigger Level	Deep Bedrock Aquifer Trigger Level
Ammonia	4.0 mg/L	0.2 mg/L
Phosphorus	7.2 mg/L	0.5 mg/L
Dissolved Organic Carbon	34.6 mg/L	18.4 mg/L
Nitrate	1.3 mg/L	0.5 mg/L
Iron	48.3 mg/L	10.6 mg/L
Manganese	17.1 mg/L	2.1 mg/L
Alkalinity	633 mg/L	996 mg/L
Escherichia Coli	25.6 CFU/100mL	5.0 CFU/100 mL

6.3 Trigger Level Assessment

The first Tier of the TLP consists of regular quarterly and semi-annual monitoring as outlined in Table 3.1. The second Tier of the TLP will be implemented if during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location. The tabulated analytical results for the shallow unconfined aquifer and deep bedrock aquifers (Tables 4.2 and 4.3, respectively) have been updated to include the trigger concentrations.

Tier II confirmatory monitoring consists of collecting follow-up water quality samples in duplicate from the location(s) that exceed the Tier I trigger levels. The Tier II confirmatory monitoring will be carried-out during the next scheduled monitoring event. Tier I monitoring will resume following confirmatory samples below the Tier I trigger levels.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

Shallow Unconfined Aquifer Assessment

The following table summarizes the results of the shallow unconfined groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2016 Tier	Trigger Level Exceedances				2017 Tier
		February	May	August	November	
MW1-08	I	-	None	-	None	I
MW2-08	I	-	None	-	None	I
MW5-09	I	Ammonia	Ammonia	Ammonia	Ammonia	I
MW101-13	II*	Nitrate	Ammonia	Ammonia	Ammonia, Nitrate	II*
MW102-13	II*	Ammonia	Ammonia	Ammonia	Ammonia	I
MW103-13	I	None	None	None	None	I
MW104-13	II*	Nitrate	None	Ammonia, Nitrate	Nitrate	II*
MW105-13	I	Ammonia	Ammonia	Ammonia	Ammonia	I
MW106-15	I	Ammonia	Ammonia	None	None	I

Notes:
- -- not sampled
* - Tier II sampling conditions are met; however, Tier I is recommended – see below

As indicated in the above table, ammonia and nitrate concentrations were reported above their recommended trigger levels at several locations during 2016. In addition, the November 16 sample collected from the extraction well, EW107-15, indicated concentrations of ammonia above the trigger limit. In two instances (MW101-13 in November, and MW104-13 in August), two parameters were above their trigger limits during the same monitoring event, thus, triggering the need for a Tier II response. However, the MW104-13 trigger level exceedances were not persistent. That is, the results from follow-up sampling events showed a decrease in trigger parameter concentrations to levels that no longer exceeded the trigger level.

It should be noted that the Site initiated a program of groundwater remediation in 2016 in response to elevated ammonia concentrations in shallow groundwater near and downgradient of the facility. Operation of this system represents implementation of the contingency remedial response to observed groundwater quality impacts. Accordingly, future trigger level assessments should be undertaken for the purpose of tracking the evolution of groundwater quality as it relates to the remedial response, and should not be used for the purpose of triggering additional remedial response.

Deep Bedrock Aquifer

The following table summarizes the results of the deep bedrock groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2016 Tier	Trigger Level Exceedances		2017 Tier
		May	November	
TW-7	I	None	None	I
TW-4	I	Ammonia	Ammonia	I
TW-8	II	Ammonia	None	I

Concentrations of ammonia and nitrate concentrations exceeded their respective deep bedrock Tier I trigger levels at TW-8 in the fall 2015 sample. Thus, it was recommended that that Tier II sampling be initiated at TW-8 in the spring of 2016. In May 2016, nitrate concentrations at TW-8 were reported non-detect (detection limit of 0.020 milligrams per litre (mg/L)) in both the duplicate sample and the original sample which were below the Tier I trigger limit of 0.5 mg/L. Therefore, a Tier II response is not required at this time. On the basis of the above, it is recommended that all bedrock groundwater wells are sampled under the normal Tier I sampling frequency during 2017.

7. Conclusions

The following conclusions have been developed based on results of the groundwater and surface water monitoring and sampling activities conducted in 2016:

1. Based on the groundwater elevations gathered in May and November 2016, shallow unconfined aquifer flow occurs in an east-northeast direction and groundwater in the deep bedrock aquifer flows in a west-southwest direction, opposite to the direction of the shallow unconfined aquifer.
2. Analytical results for the shallow unconfined aquifer samples indicate that groundwater quality at the Site is being altered by Facility operations. The distribution of elevated concentrations of ammonia, DOC, iron, and manganese are consistent with a contaminant plume related to an organic contaminant source emanating from the Facility. Recent monitoring results suggest a trend of stable to decreasing ammonia levels downgradient of the facility.
3. Analytical sample results obtained from the deep bedrock aquifer unit monitoring wells indicate that groundwater quality in the deep bedrock aquifer may be altered by Facility operations. Increasing trends of ammonia concentrations during previous monitoring periods have been observed downgradient of the Facility. The 2016 monitoring results have shown some evidence of an overall decreasing trend which includes ammonia when comparing 2016 to 2015 analytical data.
4. Surface water sample results indicate that surface water quality downstream of the Site was largely unaltered by Site activities during the 2016 monitoring period.
5. Surface water was discharged once from the on-Site Stormwater Management Pond during the 2016 monitoring period (March). In the March 2016 sample collected from the Stormwater Management Pond all parameters were below their respective trigger levels listed in the Site ECA.

8. Recommendations

Based on the results of the water quality monitoring program conducted at the Facility, the following recommendations are presented:

1. Operation of the groundwater extraction system should continue, removing as much impacted groundwater from the shallow flow system as is practical.
2. The newly installed surface water staff gauges should be surveyed and monitored so that an assessment of potential groundwater discharge to surface water can be made using direct monitoring data from each staff gauge.
3. Future monitoring reports should assess the effectiveness of the extraction well and provide recommendations for continued operation or expansion, as appropriate, of the current remediation system.

SG-3	NS	NS	-	-	-	-	North Drainage Ditch	
SG-4	NS	NS	-	-	-	-	North Drainage Ditch	

Notes:

m AMSL metres above mean sea level.
m bgs metres below ground surface.
NI No Information.
NS Not Surveyed.
(1) The ground surface and reference elevations are based on ground surface next to well and the top of the riser pipe, respectively. MW6-08 to MW10-08 were surveyed in December 2009 and all remaining wells were resurveyed in June 2010. The 2015-series wells have not yet been surveyed.
(2) Bedrock wells are open to the rock.
(3) Decommissioned, replaced by MW05-09
(4) Located on Tomlinson property; no longer accessible.
(5) Decommissioned, replaced by MW101-13

Notes:

[1] General chemistry parameters - colour, alkalinity, ammonia, BOD, COD, chloride, colour, DOC, nitrate, nitrite, pH, phenols, phosphorus, sulphate, TDS, TKN, TSS turbidity, and un-ionized ammonia

[2] Metals - arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, and zinc

[3] Surface water metals are total while groundwater metals are dissolved.

[4] PAHs - polycyclic aromatic hydrocarbons - anthracene, benzo(a)pyrene

[5] Escherichia coli (e.coli), fecal coliform bacteria, total coliform bacteria

[7] SW4-09 is sampled by GHD field staff on a bi-annual basis and monthly by Orgaworld staff (when it's safe to do so)

X Samples to be collected quarterly (winter, spring, summer, and fall)

√ Samples to be collected semi-annually (spring and fall)

o Samples are collected annually (typically spring)

Notes:

(1) Ministry of Environment and Energy (MOEE), Provincial Water Quality Objectives (PWQO), July 1994, reprinted February 1999.
(a) Geometric mean number of counts per 100 mL determined from a minimum of 5 samples. As of May 1, 1994, MOEE staff were advised to base all new compliance, enforcement and monitoring activities on the E. coli test. As such, Fecal Coliform and Total Coliform exceedances are not highlighted
(b) PWQO for Cr (III); PWQO for Cr (VI) is 0.001 mg/L.
(c) Lead objective is alkalinity dependent. For alkalinity <20 mg/L the PWQO is 5 µg/L, for alkalinity between 40 and 80 mg/L, the PWQO is 20 µg/L, and for alkalinity > 80 mg/L the PWQO is 25 µg/L.
(d) Unionized ammonia is calculated based on pH, temperature, and total ammonia concentration.
(e) No firm objective. Proposed objective is for protection against aesthetic deterioration and excessive plant growth in rivers and streams.
(f) Dissolved oxygen is temperature dependent. Value should not be less than the range of 7 mg/L (0 °C) to 4 mg/L (25 °C) for warm water biota.
(g) An interim PWQO of 0.02 mg/L has been set for zinc. The established PWQO for zinc is 0.03 mg/L.
J Estimated concentration.
ND Non-detect at associated value.
U Not present at or above the associated value.
R Rejected.
- Not analyzed.
Exceedence of the PWQO

Surface Water Analytical Results
2016 Groundwater and Surface Water Monitoring Report
Orgaworld Canada Ltd.
5123 Hawthorne Road, Ottawa, ON

Notes:

(1) Ministry of Environment and Energy (MOEE), Provincial Water Quality Objectives (PWQO), July 1994, reprinted February 1999.
(a) Geometric mean number of counts per 100 mL determined from a minimum of 5 samples. As of May 1, 1994, MOEE staff were advised to base all new compliance, enforcement and monitoring activities on the E. coli test. As such, Fecal Coliform and Total Coliform exceedances are not highlighted
(b) PWQO for Cr (III); PWQO for Cr (VI) is 0.001 mg/L.
(c) Lead objective is alkalinity dependent. For alkalinity <20 mg/L the PWQO is 5 µg/L, for alkalinity between 40 and 80 mg/L, the PWQO is 20 µg/L, and for alkalinity > 80 mg/L the PWQO is 25 µg/L.
(d) Unionized ammonia is calculated based on pH, temperature, and total ammonia concentration.
(e) No firm objective. Proposed objective is for protection against aesthetic deterioration and excessive plant growth in rivers and streams.
(f) Dissolved oxygen is temperature dependent. Value should not be less than the range of 7 mg/L (0 °C) to 4 mg/L (25 °C) for warm water biota.
(g) An interim PWQO of 0.02 mg/L has been set for zinc. The established PWQO for zinc is 0.03 mg/L.
J Estimated concentration.
ND Non-detect at associated value.
U Not present at or above the associated value.
R Rejected.
- Not analyzed.
Exceedence of the PWQO

AMENDED CERTIFICATE OF APPROVAL
INDUSTRIAL SEWAGE WORKS
NUMBER 7251-8GKRPD
Issue Date: May 30, 2011

Orgaworld Canada Ltd.
4675 Wellington Rd S
London, Ontario
N6K 0C7

Site Location: 5123 Hawthorne Road South
Lot Part of West Half of 27, Concession 6
Ottawa City,
K1G 3Y3

You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

the establishment of stormwater management *Works* for the collection, transmission, treatment and disposal of stormwater runoff and process/wash sewage from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central SWM facility off site (adjacent Hawthorne Industrial Park), and subsequently discharging through a ditch to Findlay Creek, for all storm events up to and including the 100 year return storm, consisting of the following:

PROPOSED WORKS

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.
- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.
- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters below trigger levels.

EXISTING WORKS

Part 1 Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	Elevation (m)	Storage Volume (m^3)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:
    1. Inlet structure. A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;
    2. Overflow channel. A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.
- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;
- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.
- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.
- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide over 80% total net annual TSS removal, discharging to a forebay of the wet pond;
- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;
- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.
- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

The above, including erosion/sedimentation control measures during construction and all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

Part II <u>Process Water Recirculation System</u>

- A Process Water Recirculation System (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:
- Six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;
- Four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;
- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.
- Piping for percolate/washdown water supply to the composting area including a sprinkling system;
- An odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- Piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

All in accordance with the following submitted supporting documents:

1. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

2. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

3. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

4. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

5. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

6. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

7. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

8. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

9. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

10. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

11. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

12. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

13. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

14. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

15. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

CONTENT COPY OF ORIGINAL

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"*Act*" means the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, as amended;

"*BOD5*" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"*CBOD5*" means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"*Certificate*" means this entire certificate of approval document, issued in accordance with Section 53 of the *Act*, and includes any schedules;

"*COD*" means Chemical Oxygen Demand;

"*Director*" means any *Ministry* employee appointed by the Minister pursuant to section 5 of the *Act*;

"*District Manager*" means the District Manager of the Ottawa District Office of the Ministry;

"*DOC*" means Dissolved Organic Carbon;

"*Leachate Contaminated Sewage*" means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"*Ministry*" means the Ontario Ministry of the Environment;

"*Owner*" means Orgaworld Canada Ltd., also referred as OCL, and includes its successors and assignees;

"*Substantial Completion*" has the same meaning as "*substantial performance*" in the Construction Lien Act; and

"*Works*" means the sewage works described in the *Owner's* application, this *Certificate* and in the supporting documentation referred to herein, to the extent approved by this *Certificate.*

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL PROVISIONS

(1) The *Owner* shall ensure that any person authorized to carry out work on or operate any aspect of the *Works* is notified of this *Certificate* and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these Conditions, the *Owner* shall design, build, install, operate and maintain the *Works* in accordance with the description given in this *Certificate* the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this *Certificate.*

(3) Where there is a conflict between a provision of any submitted document referred to in this *Certificate* and the Conditions of this *Certificate*, the Conditions in this *Certificate* shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the listed submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The requirements of this *Certificate* are severable. If any requirement of this *Certificate*, or the application of any

CONTENT COPY OF ORIGINAL

requirement of this *Certificate* to any circumstance, is held invalid or unenforceable, the application of such requirement to other circumstances and the remainder of this certificate shall not be affected thereby.

2. EXPIRY OF APPROVAL

The approval issued by this *Certificate* will cease to apply to those parts of the *Works* which have not been constructed within **five (5) years** of the date of this *Certificate.*

3. CHANGE OF OWNER

(1) The *Owner* shall notify the *District Manager* and the *Director*, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of *Owner;*

(b) change of address of the *Owner;*

(c) change of partners where the *Owner* is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Business Names Act, R.S.O. 1990, c.B17 shall be included in the notification to the *District Manager;*

(d) change of name of the corporation where the *Owner* is or at any time becomes a corporation, and a copy of the most current information filed under the Corporations Information Act, R.S.O. 1990, c. C39 shall be included in the notification to the *District Manager;*

(2) In the event of any change in ownership of the *Works*, other than a change to a successor municipality, the *Owner* shall notify in writing the succeeding owner of the existence of this *Certificate*, and a copy of such notice shall be forwarded to the *District Manager* and the *Director.*

4. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the *Substantial Completion* of the *Works*, a set of as-built drawings showing the *Works* as "constructed" shall be completed and submitted by the *Owner* to the *District Manager.* These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the *Works* or at operational office of the *Owner* for the operational life of the *Works.*

(2) The *Owner* shall inform in writing to the *District Manager* when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The *Owner* shall inform the *District Manager* of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

5. SURFACE WATER MONITORING AND RECORDING

(1) The *Owner* shall, upon commencement of operation of the *Works*, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

CONTENT COPY OF ORIGINAL

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganics**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's Procedure F-10-1, "Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works (Liquid Waste Streams Only), as amended from time to time by more recently published editions;

(b) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (January 1999), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(c) the publication "Standard Methods for the Examination of Water and Wastewater" (20th edition), as amended from time to time by more recently published editions;

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after two (2) years of operation of the *Works* in accordance with this Condition, be modified by the *District Manager* in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The *Owner*shall retain for a minimum of **three (3) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this *Certificate*.

6. OPERATION AND MAINTENANCE

(1) Up on commencement of operation of the *Works*, the *Owner*shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works*prepared in accordance with Condition (8) is submitted to the *District Manager*for comments and concurrance;

(2) Upon commencement of operation of the *Works*, the *Owner*shall implement all operating procedures identified in the operations manual. This manual shall include, but not necessarily be limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works*and the methods or tests

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

(4) The *Owner* shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the *Owner* shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 5(2). The *Owner* shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the *Owner* shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 6 (1) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the *Owner*shall ensure that the contents of the SWM pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner;

(8) The *Owner*shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to;

(9) Discharge of leachate contaminated sewage from the *Works*to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage;

(10) The *Owner* shall notify the *District Manager* orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The *Owner* shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The *Owner* shall inspect the *Works* at least once a year and, if necessary, clean and maintain the *Works* to prevent the excessive build-up of sediments and/or vegetation.

(13) The *Owner* shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or *Owner's* operational headquarters for inspection by the *Ministry*. The logbook shall include the following:

(a) the name of the *Works;*

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The *Owner* shall not store any end-product, including leaves and yard waste outdoors until the *Owner* prepares a Conditions Assessment and implementation plan approved by the *District Manager*. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

7. OPERATION AND MAINTENANCE

(1) Before the commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* is prepared as per Condition (8), submitted to the *District Manager;*

(2) Up on commencement of operation of the *Works*, the *Owner* shall implement all operational procedures identified in the operation manual. The operation manual shall include, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

CONTENT COPY OF ORIGINAL

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

PART IV - GENERAL

8. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the *Works,*the *Owner*shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the

CONTENT COPY OF ORIGINAL

operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the *Owner*.

9. GROUNDWATER MONITORING

Upon issuance of this *Certificate*, the *Owner* shall establish the following groundwater monitoring program with monitoring wells located as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates.

(1) For the unconfined shallow groundwater aquifer, the *Owner* shall establish and maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing eight (8) monitoring wells designated as: MW1-08 to MW5-08; and MW101 to MW103 and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(2) For the confined deep bedrock aquifer, the *Owner* shall maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing three (3) monitoring wells designated as: TW-4, TW-7, and TW-8 (within the Orgaworld Canada Ltd. site), and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(3) Within **sixty (60) days** of the issuance of this Certificate, the *Owner* shall:

(a) complete an assessment of the groundwater quality for each stratrigraphic unit:

(b) develop criteria in accordance with the Ministry Guideline B-7 - Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities; and

(c) submit to the *District Manager* for review and concurrence.

(4) The *Owner* shall collect groundwater samples twice per year - in May and November - from the monitoring wells listed at subsections (1) and (2), and increase the sampling frequency to four times per year - in February, May, August and November - for the three new wells MW101, MW102, and MW103.

(5) The Owner shall have the samples collected pursuant to subsection (2) filtered and analyzed for Alkalinity, Colour, Iron, Manganese, Cadmium, Molybdenum, Zinc, Petroleum Hydrocarbons fractions, Anthracene, arsenic, E.Coli, feacal coliforms, total coliforms, Total Disssolved Solids (TDS), DOC, turbidity, pH, CBOD5, temperature, using the analytical protocols listed at Condition 5 (2).

(6) The Owner shall measure the water level elevation in each of the monitoring wells identified in subsection (1) and (2) at the time of collection of water samples pursuant to subsections (4).

(7) The measurement frequencies specified in subsection (4) in respect of any parameter are minimum requirements which may, after **two (2) years** of operation of the Works, be modified by the *District Manager* in writing from time to time.

(8) After **two (2) years** of operation of the *Works*, the *Owner* shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this *Certificate* to the *Director* and the *District Manager*.

10. REPORTING

(1) **One (1) week** prior to the start up of the operation of the *Works*, the *Owner* shall notify the *District Manager* (in writing) of the pending start up date.

(2) The *Owner* shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to *Ministry* staff.

(3) The *Owner* shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the

period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the *Works* and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works;*

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the *District Manager* requires from time to time.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the *Works* are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the *Certificate* and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. The condition also advises the Owners their responsibility to notify any person they authorized to carry out work pursuant to this *Certificate* the existence of this *Certificate.*

2. Condition 2 is included to ensure that, when the *Works* are constructed, the *Works* will meet the standards that apply at the time of construction to ensure the ongoing protection of the environment.

3. Condition 3 is included to ensure that the *Ministry* records are kept accurate and current with respect to the approved works and to ensure that subsequent owners of the *Works* are made aware of the *Certificate* and continue to operate the *Works* in compliance with it.

4. Condition 4 is included to ensure that the *Works* are constructed in accordance with the approval and that record drawings of the *Works* "as constructed" are maintained for future references.

5. Conditions 5 and 9 are included to enable the *Owner* to evaluate and demonstrate the performance of the *Works,* on a continual basis, so that the *Works* are properly operated and maintained at a level which is consistent with the design objectives specified in the *Certificate* and that the *Works* does not cause any impairment to the receiving watercourse.

6. Conditions 6, 7 and 8 are included to require that the *Works* be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the *Ministry.*

7. Condition 10 is included to provide a performance record for future references, to ensure that the *Ministry* is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this *Certificate,* so that the *Ministry* can work with the *Owner* in resolving any problems in a timely manner.

This Certificate of Approval revokes and replaces Certificate(s) of Approval No. 7032-88XPRA issued on September 7, 2010.

CONTENT COPY OF ORIGINAL

written notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 101 of the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

1. The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Certificate of Approval number;
6. The date of the Certificate of Approval;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, 15th Floor
Toronto, Ontario
M5G 1E5

AND

The Director
Section 53, *Ontario Water Resources Act*
Ministry of the Environment
2 St. Clair Avenue West, Floor 12A
Toronto, Ontario

Ministry of the Environment and Climate Change
Ministère de l'Environnement et de l'Action en matière de changement climatique

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 2844-9YNGZC
Issue Date: February 1, 2017

Orgaworld Canada Ltd.
150 Kent Street
London, Ontario
N6A 1L3

Site Location: Source Separated Organics Processing Facility
5123 Hawthorne Road South
Part of West Half of Lot 27, Concession 6
City of Ottawa
K1G 3Y3

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

existing sewage works for the collection, transmission, treatment and disposal of stormwater runoff & process / wash water from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central stormwater management (SWM) facility off-site (i.e. at the adjacent Hawthorne Industrial Park) which subsequently discharges to the Findlay Creek through a roadside ditch, for all storm events up to and including the 100 year return storm, consisting of the following:

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.

- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.

- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters

below trigger levels.

Part I Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	**Elevation** (metre)	**Storage Volume** (cubic metres)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:

    - inlet structure: A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;

    - overflow channel: A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.

- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;

- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.

- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.

- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide

over 80% total net annual TSS removal, discharging to a forebay of the wet pond;

- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;

- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.

- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

Part II Process Water Recirculation System

- a **Process Water Recirculation System** (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:

- six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;

- four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;

- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.

- piping for percolate/washdown water supply to the composting area including a sprinkling system;

- an odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water

and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned Works.

all in accordance with supporting documents listed in Schedule 'A'.

For the purpose of this environmental compliance approval, the following definitions apply:

"Application" means the application for an environmental compliance approval submitted to the Ministry for approval by or on behalf of the Owner and dated March 11, 2015;

"Approval" means this entire document and any schedules attached to it, and the Application;

"BOD_5"(also known as $TBOD_5$) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"$CBOD_5$"means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"COD" means Chemical Oxygen Demand;

"District Manager" means the District Manager of the Ottawa District Office of the Ministry;

"DOC" means Dissolved Organic Carbon;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for the purposes of Part II.1 of the EPA;

"*E. coli* " refers to the thermally tolerant forms of Escherichia that can survive at 44.5 degrees Celsius;

"EPA" means the *Environmental Protection Act, R.S.O. 1990, c.E.19* , as amended;

"Leachate Contaminated Sewage"means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Owner" means Orgaworld Canada Ltd., and its successors and assignees;

"OWRA" means the *Ontario Water Resources Act, R.S.O. 1990, c. O.40* , as amended;

"Substantial Completion" has the same meaning as "substantial performance" in the *Construction Lien Act* ; and

"Works" means the sewage works described in the Owner's application, and this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the terms and conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these terms and conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with this Approval.

(3) Where there is a conflict between a provision of this environmental compliance approval and any document submitted by the Owner, the conditions in this environmental compliance approval shall take precedence. Where there is a conflict between one or more of the documents submitted by the Owner, the Application shall take precedence unless it is clear that the purpose of the document was to amend the Application

(4) Where there is a conflict between the documents listed in the Schedule A, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The terms and conditions of this Approval are severable. If any term and condition of this environmental compliance approval, or the application of any requirement of this environmental compliance approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

(6) The issuance of, and compliance with the conditions of, this Approval does not:

(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement, including, but not limited to, the obligation

to obtain approval from the local conservation authority necessary to construct or operate the sewage Works; or

(b) limit in any way the authority of the Ministry to require certain steps be taken to require the Owner to furnish any further information related to compliance with this Approval.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of address of Owner or operating authority;

(b) change of Owner or operating authority or both, including address of new Owner or operating authority, or both;

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the *Business Names Act, R.S.O. 1990, c. B.17* ; and

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the "Initial Return" or "Notice of Change" filed under the *Corporations Information Act, R.S.O. 1990, c. C.39* , shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the Works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this condition refer to the number at the top of this environmental compliance approval.

3. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the Substantial Completion of the Works,a set of as-built drawings showing the Works as "constructed" shall be completed and submitted by the Owner to the District Manager.These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the Works or at operational office of the Owner for the operational life of the Works.

(2) The Owner shall inform in writing to the District Manager when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The Owner shall inform the District Manager of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

4. SURFACE WATER MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganic**	**Field Parameters**
BOD_5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen (TAN)	Chromium	Temperature
Total Kjeldahl Nitrogen (TKN)	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus (TP)	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after **two (2) years** of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The Owner shall retain for a minimum of **five (5) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

5. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(4) The Owner shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the Owner shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 4.(2). The Owner shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N	2.93
$CBOD_5$	15
Total Phosphorus (TP)	0.4
Total Suspended Solids (TSS)	15
E-coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the Owner shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 5.(2) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the Owner shall ensure that the contents of the SWM Pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner.

(8) The Owner shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to.

(9) Discharge of leachate contaminated sewage from the Works to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

(10) The Owner shall notify the District Manager orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The Owner shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation.

(13) The Owner shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or Owner's operational headquarters for inspection by the Ministry.The logbook shall include the following:

(a) the name of the Works;

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The Owner shall not store any end-product, including leaves and yard waste outdoors until the Owner prepares a Conditions Assessment and implementation plan approved by the District Manager. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

6. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

PART IV - GENERAL

7. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the Works, the Owner shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall

include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the Owner.

9. GROUNDWATER MONITORING

Groundwater Monitoring Program

(1) The Owner shall, upon the issuance of this Approval, carry out the following groundwater monitoring program. Samples shall be collected from the specified groundwater monitoring wells at the frequency specified, by means of the specified sample type and analyzed for each parameter listed and all results recorded:

Table 3 - Groundwater Monitoring

Unconfined Shallow Aquifer

MW1-08*, MW2-08*, MW3-08*, MW4-09*, & MW103-09*.

MW5-09**, MW101-13**, MW102-09**, MW104-13**, MW105-13**, MW106-15** & EW107-15**.

Deep Bedrock Aquifer

TW-4*, TW-7* & TW-8*.

Frequency	*Semi Annual (i.e. two times in a year) ** Tri-Annual (i.e. three time in a year)
Sample Type	Grab
Parameters	Alkalinity, Total Ammonia Nitrogen, Dissolved Organic Carbon, *E-coli* , Iron, Manganese, Nitrate-N, and Total Phosphorous.

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after three (3) years of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall compare analytical monitoring results obtained pursuant to Subsection (1) Table 3 - Groundwater Monitoring with the trigger level concentrations for the trigger parameter listed in Tables 4 and 5.

Table 4
Trigger Level Concentrations
Unconfined Shallow Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	633
Total Ammonia Nitrogen	4.0
Dissolved Organic Carbon	34.6
E-coli	25.6 CFU/100 mL
Iron	48.3
Manganese	17.1
Nitrate-N	1.3
Total Phosphorous	7.2

Table 5
Trigger Parameters
Deep Bedrock Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	996
Total Ammonia Nitrogen	0.2
Dissolved Organic Carbon	18.4
E-coli	5.0 CFU/100 mL
Iron	10.6
Manganese	2.1
Nitrate-N	0.5
Total Phosphorous	0.5

(5) The trigger level program shall be implemented using the following three (3) Tiers to verify the results and direct potential contingency implementation:

Tier I (Routine Monitoring Program)

Tier I Routine Monitoring Program (RMP) involves the sampling of all on-site groundwater monitoring wells at the frequency specified in Table 3. All groundwater monitoring activities completed at the site will be considered Tier I RMP unless two (2) or more trigger parameters exceed there respective trigger levels in a simple sample.

Tier II (Confirmation Monitoring Program)

If during a single monitoring event, two (2) or more trigger parameters exceed the established (see Tables 4 and 5) Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring Program (CMP) shall be implemented.

The Tier II CMP consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next schedule monitoring event in order to confirm the Tier I exceedance of the two (2) or more trigger parameters.

If the concentrations reported in the duplicate sample return to below their respective trigger levels, then Tier I RMP will resume.

If the Tier I exceedance is confirmed, then the next step shall be a re-evaluation of the degree, nature, and potential source(s) of the trigger level impact(s) identified in Tier I including the implication of the exceedance in terms of the potential for impacts to down-gradient off-site water users.

If the Tier II CMP and the subsequent evaluation indicate that the facility operations are having a detrimental effect on water quality migrating off-site, then Tier III Contingency Measures and Compliance Monitoring Program shall be implemented.

Tier III (Contingency Measures and Compliance Monitoring Program)

Tier III Contingency Measures and Compliance Monitoring Program (CMCMP) involves assessment and implementation of contingency measures in the event of imminent off-site groundwater quality impairment.

Contingency measures to be evaluated should include extraction of impacted groundwater and/or surface water for on-site treatment or off-site disposal, or acquisition of groundwater rights and registration of a contaminated attenuation zone (CAZ) on title of adjacent lands.

Tier III CMCMP should also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented.

The Tier III CMCMP details should be determined in conjunction with the development and implementation of preferred contingency measure(s).

The compliance monitoring parameters, locations, and monitoring frequency should be determined at the time of implementation of contingency measures.

Lastly, appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed.

(6) The Owner shall notify the District Manager orally, as soon as possible, and in writing within

seven (7) days in the event a trigger exceedance occurs.

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

10. REPORTING

(1) The Owner shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to Ministry staff.

(2) The Owner shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the Works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the Works;

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the District Manager requires from time to time.

SCHEDULE 'A'

1. Environmental Compliance Approval Application for Industrial Sewage Works submitted by Ben Constable, Conestoga-Rovers & Associates (CRA), and signed by Mike Rooke, Compliance Officer, Orgaworld Canada Ltd., dated March 11, 2015, and all supporting documentation and information.

2. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

3. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

4. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

5. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

6. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

7. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

8. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

9. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

10. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

11. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla,

P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

12. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

13. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

14. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

15. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

16. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. Condition 1.(6) is included to emphasize that the issuance of this Approval does not diminish any other statutory and regulatory obligations to which the Owner is subject in the construction, maintenance and operation of the Works. The condition specifically highlights the need to obtain any necessary conservation authority approvals. The condition also emphasizes the fact that this Approval doesn't limit the authority of the Ministry to require further information.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved Works and to ensure that subsequent owners of the Works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is included to ensure that the Works are constructed in accordance with the approval and that record drawings of the Works"as constructed" are maintained for future references.

4. Conditions 4 and 8 are included to enable the Owner to evaluate and demonstrate the performance of the Works,on a continual basis, so that the Works are properly operated and maintained at a level which is consistent with the design objectives specified in the Approval and that the Works does not cause any impairment to the receiving watercourse.

5. Conditions 5, 6 and 7 are included to require that the Works be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the Ministry.

6. Condition 9 is included to provide a performance record for future references, to ensure that the Ministry is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this Approval, so that the Ministry can work with the Owner in resolving any problems in a timely manner.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 7251-8GKRPD issued on May 30, 2011.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

1. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The environmental compliance approval number;
6. The date of the environmental compliance approval;
7. The name of the Director, and;
8. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/28	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Recommended Compliance and Trigger Level Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline a recommended groundwater Compliance and Trigger Level Program (TLP) for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Facility) located at the 5123 Hawthorne Road, Ottawa, Ontario (Site). The TLP has been developed to satisfy Condition 9(8) of the Environmental Compliance Approval (Industrial Sewage Works No. 7251-8GKRPD) (ECA) for the Site and is being submitted in support of an application to amend the ECA. The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

The following Section discusses the results of previous assessments of groundwater compliance and trigger level assessments for the Site. A recommended TLP for the Site is presented in Section 3.0.

2.0 Background

The OCL Site is approximately 10 hectares in area and is situated in the southwest corner of the Hawthorne Industrial Park (HIP) subdivision, which covers an area of approximately 80 hectares. Since the early/mid 1990's, the HIP subdivision has historically received excess fill materials from various construction and demolition projects, which is understood to consist primarily of clean soil with some concrete debris and reclaimed asphalt pavement and aggregate materials, and has also been intermittently used for temporary storage of various construction related materials. The area surrounding the HIP subdivision has a number of mineral aggregate extraction operations in place (south-east, west, and north-west of HIP), some of which are still active. The OCL Site was also subject to mineral aggregate removals prior to Facility development by OCL. Given the historic and ongoing land uses around the subject Site, there is the potential for soil, groundwater, and surface water quality impairment related to the various past activities.

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

As part of the ECA development for this Site, the MOE requested a groundwater monitoring program be implemented to ensure that the proposed operation of the OCL Facility does not adversely affect the surrounding environment (there are concerns for downstream agricultural users of the shallow/surface water regime, and for the deeper-aquifer which supplies potable water to a number of nearby properties). The purpose of the groundwater monitoring program is to evaluate the potential impact of OCL activities on the groundwater and surface water quality; regular monitoring allows for the analysis of trends over time and ensures there is an early warning of potential problems.

Previous assessments of groundwater quality at the Site have identified pre-existing groundwater quality as an obstacle to developing a functional TLP for groundwater in the current Site context. Historical backfill material used on Site, as well as historical and surrounding land uses have resulted in highly variable groundwater quality. For this reason, typical assessments using generic water quality standards as the basis for assessing compliance at the Site boundary do not provide meaningful indications of the effects of Facility operations on groundwater quality.

Condition 9(3b) of the ECA requires the development of criteria in accordance with MOE Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). CRA initially completed an assessment of on-Site water quality in accordance with the Reasonable Use Concept in a memo to Tracy Hart of the MOE dated February 5, 2010. Assessments of water quality provided in Annual Monitoring Reports following submission of the February 5, 2010 memo concluded that the application of the Reasonable Use Concept at the downgradient property boundary is irrelevant due to the presence of numerous parameters elevated above generic standards in background water quality. As such, the Site-specific criteria calculated using the Reasonable Use Concept are not considered appropriate for evaluating Site compliance.

A groundwater trigger level assessment that used intra-well baseline data was provided in the 2012 Annual Monitoring Report for the Site. This type of assessment can be useful for identifying potential increases in groundwater quality impacts by comparing current data to statistically-based upper tolerance limits (UTLs) developed from historical data at individual wells. However, the use of trigger levels based on intra-well baseline UTLs is not considered appropriate for the Site for the following reasons:

1. There is insufficient pre-start-up data to provide statistically valid intra-well baseline data.
2. The intra-well baseline method does not account for the movement of pre-start-up water quality impacts from one portion of the Site to another. Based on the highly variable water quality on-Site prior to start-up of Facility operations, this could yield false triggers in downgradient on-Site monitoring wells.

3.0 Recommended Compliance and Trigger Level Program

For the purposes of assessing potential groundwater quality impairments related to the activities approved under the ECA, comparison of post-start-up data to pre-start-up data provides a useful comparison. Water quality data from pre-start-up monitoring demonstrated considerable variability within the shallow unconfined aquifer across the Site. This pattern is consistent with variable pre-existing sources of water

quality impacts upgradient and/or on-Site. Some sources of water quality impacts un-related to the Facility operations include: current and historical quarrying operations located upgradient of the Site, historical backfill materials used for grading at the Site, and various other current and historical industrial and agricultural activities in the vicinity.

Therefore, in consideration of the variable water quality pre-existing Facility operations, it is recommended that the aggregate Site-wide pre-start-up water quality data be used as the basis for establishing groundwater trigger levels for the shallow unconfined aquifer. The pre-start-up data is all data collected from shallow unconfined aquifer monitoring wells between July 2008 and January 2010. By using an appropriate statistical representation of the overall pre-existing water quality, the trigger levels will provide indications of new water quality impairments, not related to historical activities. This method will reduce the potential for trigger levels being exceeded at specific on-Site monitoring locations due to the migration of pre-existing water quality impairments within the Site boundaries.

It is recommended that the groundwater trigger level program focus on a reduced set of parameters that reflect the sources of potential impact from on-Site activities. These parameters will thus act as surrogates for Site-related water quality impacts. Based on a review of water quality data for the Site and the known sources of impact associated with organic waste processing, the trigger level program should include the following trigger parameters: ammonia, phosphorus, dissolved organic carbon, nitrate, iron, manganese, alkalinity and E. coli.

Ammonia, phosphorus, dissolved organic carbon; nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants to the subsurface.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Shallow Unconfined Aquifer

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the shallow unconfined aquifer. The trigger levels are based on the 95% UTLs for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	4.0 mg/L
Phosphorus	7.2 mg/L
Dissolved Organic Carbon	34.6 mg/L
Nitrate	1.3 mg/L
Iron	48.3 mg/L
Manganese	17.1 mg/L
Alkalinity	633 mg/L
E. coli	25.6 CFU/100mL

Deep Bedrock Unit

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the bedrock aquifer. As an alternative, 95% UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations.

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the bedrock aquifer. The trigger levels are based on the 95% (UTL) for upgradient (TW-7) groundwater data in the bedrock aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	0.2 mg/L
Phosphorus	0.5 mg/L
Dissolved Organic Carbon	18.4 mg/L
Nitrate	0.5 mg/L
Iron	10.6 mg/L
Manganese	2.1 mg/L
Alkalinity	996 mg/L
E. coli	5.0 CFU/100mL

A pumping test completed in 2008 within the deep bedrock unit as part of the Phase II ESA confirmed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. For this reason, any exceedances of the above-referenced trigger levels for the deep bedrock unit should be reviewed in conjunction with other monitoring data to assess whether or not the exceedances are related to Facility operations. It is unlikely that Facility operations will affect deep bedrock unit water quality.

Trigger level program - Tiers

The TLP should be implemented using a series of three Tiers to verify the results and direct potential contingency implementation. The following paragraphs describe the three Tiers recommended to be included as part of the TLP.

Tier I – Routine Monitoring and Trigger Locations

Tier I monitoring involves the sampling of all on-Site groundwater monitoring wells at the frequency prescribed in the Site environmental monitoring program. All groundwater monitoring activities completed at the Site will be considered Tier I monitoring unless two or more trigger parameters exceed their respective trigger levels in a single sample.

Groundwater monitoring will be conducted at the Site, as follows:

- Tri-annually (three times per year) at MW101-13, MW102-09, MW104-13, MW105-09, MW5-09, MW106-15*
- Semi-annually (twice per year) at all remaining overburden and bedrock monitoring wells, respectively MW1-08, MW2-08, MW3-08, MW4-09, and MW103-09

*-Not yet installed

Tier II – Confirmation Monitoring

If during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring program will be implemented. The Tier II Confirmation Monitoring program consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next scheduled monitoring event in order to confirm the Tier I exceedance of the two or more trigger parameters. If the concentrations reported in the duplicate samples return to below their respective trigger levels, then Tier I monitoring will resume.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

The comparison of the observed water quality to generic criteria, the applicable regulatory compliance framework, the pre-existing water quality, and downgradient use of groundwater will dictate the timing and urgency of response. The comparison should also include parameter trend analyses over time and the contributions of sources of impact other than the Facility. If the Tier II Confirmation Monitoring program and subsequent evaluation indicate that Facility operations are having a detrimental effect on water quality migrating off-Site, then Tier III - Contingency Measures will be implemented.

Tier III – Contingency Measures and Compliance Monitoring

The Tier III portion of the TLP involves assessment and implementation of contingency measures in the event of imminent off-Site groundwater quality impairment. Contingency measures to be evaluated would include extraction of impacted groundwater and/or surface water for on-Site treatment or off-Site disposal, or acquisition of groundwater rights and registration of a contaminant attenuation zone on title of adjacent lands.

Tier III also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented. The Tier III compliance monitoring program details would be determined in conjunction with the development and implementation of preferred contingency measure(s). The compliance monitoring parameters, locations and monitoring frequency would be determined at the time of implementation of contingency measures.

Appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed. As the nature of potential future water quality issues cannot be known in advance, it is not practical to develop remediation plans that will necessarily best suit the particular situation in the event of water quality impairment.

4.0 Closing

It is recognized that using pre-existing water quality data as the basis for the groundwater trigger level program will not necessarily provide an effective measure of the potential for off-Site migration of adverse water quality, as it relates to adjacent water uses. For this reason, it is necessary that evaluations of water quality included within the Annual Monitoring Reports take into consideration the potential for impairment of downgradient water quality uses, regardless of the nature of the source of the impact (off-Site sources, Facility operations, historical impacts, etc.).

As such, evaluations of the shallow unconfined aquifer should compare water quality adjacent to surface water courses to the Provincial Water Quality Objectives (PWQOs) to assess the potential effects of shallow groundwater discharging to surface. Evaluations of deep bedrock groundwater should compare water quality to the Ontario Drinking Water Quality Standards (ODWQSs).

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/27	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Proposed Monitoring Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline the proposed groundwater and surface water monitoring programs for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Site) located at 5123 Hawthorne Road, Ottawa, Ontario. This memorandum has been prepared in support of an application to amend ECA No. 9465-7NVRWT (Industrial Sewage Works). The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

1.1 Current Monitoring Program

The current monitoring program for the Site is defined in the above-referenced ECA and includes hydraulic monitoring and sampling at 11 groundwater monitoring well locations within the shallow unconfined aquifer and 3 groundwater monitoring wells in the deep bedrock aquifer unit. The monitoring program also includes sampling at 4 surface water locations. The following locations are currently sampled on a semi-annual basis (twice per year):

Unconfined Shallow Aquifer	*Deep Bedrock Aquifer*	*Surface Water*
MW1-08	TW-4	SW-1
MW2-08	TW-7	SW-2
MW3-08	TW-8	SW-3
MW4-08		SW-4
MW4-09		

ISO 9001

The following locations are sampled on a quarterly basis.

Unconfined Shallow Aquifer
MW5-09
MW101-13
MW102-09
MW103-09
MW104-13
MW105-13

The current analytical parameter list for the Site, as per the Site's Environmental Compliance Approval (ECA No. 7251-8GKRPD, as amended) consists of selected general chemistry, bacteriologic components, metals, petroleum hydrocarbons (PHCs), and polycyclic aromatic hydrocarbons (PAHs).

A complete summary of the current monitoring program is provided in Table 1.

2.0 Proposed Monitoring Program

Based on the results of monitoring completed to date, there is sufficient data collected to warrant reductions in the monitoring program. The reductions in monitoring include changes in monitoring frequency at selected locations and removal of several analytical parameters from the list of analytes. The following sections discuss the proposed changes to the monitoring program.

2.1 Monitoring Frequency

A significant amount of monitoring data has been collected to date for the on-Site monitoring wells. The monitoring data has allowed for a comprehensive understanding of the spatial and temporal patterns in groundwater quality. As groundwater quality is generally well understood, it is recommended that monitoring frequency be reduced at selected locations.

During recent monitoring years, field staff has been unable to complete the winter monitoring event during February due to frozen monitoring wells. For this reason, it is recommended that the winter (February) monitoring event be removed from the monitoring program. Three monitoring events (spring, summer, and fall) should be maintained per year at locations where detailed groundwater monitoring is suitable.

The following table summarizes the recommended groundwater monitoring frequency.

Location	*Current Sampling Frequency*	*Proposed Sampling Frequency*	*Unit*	*Trigger Well*
MW101-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW102-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW103-09	Quarterly	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW1-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW2-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW3-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW4-09	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW5-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW104-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW105-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW106-15	NA	Tri-Annual	Unconfined Shallow Aquifer	Yes
EW107*	NA	Tri-Annual	Unconfined Shallow Aquifer	No
TW-4	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-7	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-8	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No

*- Not yet installed
+ - Upgradient well
NA – Not applicable

As indicated in the above table, the recommended changes to the monitoring program include:

- Reduction of monitoring from quarterly to tri-annual (three times per year) at selected locations
- Reduction of monitoring from quarterly to semi-annual at MW103-09. This location is located away from verified sources of impact and semi-annual monitoring will provide adequate water quality data at this location.

It should be noted that the monitoring frequency specified above is consistent with the monitoring frequency proposed in the updated TLP.

Groundwater monitoring well (MW106) and extraction well (EW107) have not yet been installed, but are scheduled for installation prior to the spring 2015 monitoring event. These wells should be incorporated into the monitoring program at the monitoring frequency specified above, following installation.

Surface water sampling is currently conducted at two upstream locations: SW1-09 and SW2-09. The analytical results have generally been consistent between these two locations. As there are no Site-related sources of impact between SW-1 and SW-2, it is recommended that sampling at SW-1 be discontinued. As such, surface water quality monitoring should continue semi-annually at locations SW2-09 and SW3-09. SW4-09 should continue to be sampled on a monthly basis (when weather conditions permit safe sampling at this location).

2.2 Monitoring Parameters

The existing monitoring program includes sampling of groundwater and surface water for PHC and PAH parameters. The results of PHC and PAH analyses have demonstrated largely non-detect results for the majority of these parameter lists. The sporadic detections of PHCs or PAH parameters have been inconsistent and at very low concentrations often just above the detection limits. In addition, similar infrequent low-level detections have also been reported at background monitoring locations. Therefore, it is likely that any detection of PHCs or PAHs parameters are the result of background conditions and/or related to fill materials historically used in the vicinity of the Site. Thus, PHCs and PAHs are not considered useful in evaluating groundwater and surface water for potential environmental impacts related to Site operations.

It is recommended that PHCs and PAHs be removed from the current monitoring parameter list.

The recommended monitoring program for the Site is summarized in Table 2.

TABLE 1

CURRENT MONITORING PROGRAM
MONITORING PROGRAM RATIONALIZATION
ORGAWORLD CANADA LTD - OTTAWA ORGANICS FACILITY
OTTAWA, ON

Location	Field Test Parameters			Laboratory Test Parameters							Collection Method

Notes:

[1] General chemistry parameters - colour, alkalinity, ammonia, BOD, COD, chloride, colour, DOC, nitrate, nitrite, pH, phenols, phosphorus, sulphate, TDS, TKN, TSS turbidity, and un-ionized ammonia

[2] Additional Surface Water General Chemistry parameters analyzed at SW-4 - conductivity, oil and grease (mineral/HEM/animal and vegetable)

[3] Metals - arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, and zinc

[4] Surface water metals are total while groundwater metals are dissolved.

[5] PAHs - polycyclic aromatic hydrocarbons - anthracene, benzo(a)pyrene

[6] Escherichia coli (e.coli), fecal coliform bacteria, total coliform bacteria

[7] SW4-09 is sampled by CRA field staff on a bi-annual basis and monthly by Orgaworld staff (when it's safe to do so)

[8] Expanded PAHs - collected once per year at downgradient locations. Includes:
1-methylnaphthatlene, 2-methylnapthalene, acenaphthene, acenaphthylene, acridine, benzo(a)anthracene, Benzo(b)fluoranthene
benzo(b)pyridine (quinoline), benzo(g,h,i)perylene, benzo(k)fluoranthene, carcinogenic potency equivalent, chrysene, dibenz(a,h)anthracene
fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene,and pyrene

X Samples collected quarterly (winter, spring, summer, and fall)
√ Samples to be collected semi-annually (spring and fall)
o Samples are collected annually (typically spring)

MEMORANDUM

TO:	Ministry of the Environment	REF. NO.:	045804-22
FROM:	Ben Kempel/Ben Constable/mg/25	DATE:	July 16, 2014
CC:	Tej Gidda, Ron Cherkewski, Mike Rooke		
RE:	**Groundwater Assessment and Work Plan - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates (CRA) has prepared this memorandum on behalf of Orgaworld Canada Ltd. (Orgaworld) to provide the Ministry of Environment (MOE) with the results of supplementary data assessment completed on groundwater monitoring data for the Orgaworld organic waste processing facility (Facility) located at 5123 Hawthorne Road, Ottawa, Ontario (Site). The assessment has been undertaken in response to identified increases in ammonia concentrations within shallow groundwater downgradient of the Facility. The assessment has focused on monitoring data for the most recent (2013) monitoring period and included the following activities:

- 2013 Data Assessment – Ammonia (Section 2.0)
- Additional Parameters of Concern (Section 3.0)
- Groundwater Discharge to Surface (Section 4.0)
- Data Gap Analysis (Section 5.0)

CRA has prepared a work plan for further investigating and characterizing groundwater at the Site. The purpose of the additional investigation is to refine the ammonia plume delineation, improve understanding of the aquifer properties on-Site, and determine the potential receptors associated with the plume.

Orgaworld currently operates under the following Environmental Compliance Approvals (ECA's) for the Site:

- Number 7021-7HQNDE (Air), September 16, 2009
- Number 9465-7NVRWT (Industrial Sewage Works), September 16, 2009
- Number 7032-88XPRA (Industrial Sewage Works), Amended September 7, 2010
- Number 7251-8GKRPD (Industrial Sewage Works), Amended May 30, 2011
- Number 2766-7HEPSZ (Waste Disposal Site), September 16, 2009, Amended under Notice No. 1, October 21, 2010

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

Condition 9 (8) of ECA Number 7251-8GKRPD requires that Orgaworld establish a comprehensive Compliance and Trigger Level Monitoring Program based on groundwater monitoring within two years of operations. The Compliance and Trigger Level Monitoring Program is to be submitted to the MOE along with an application to amend the ECA. Orgaworld has not applied to amend the ECA, as the monitoring data gathered since 2010 to define baseline conditions for the site has been influenced by both existing conditions at the Site, largely comprised of historical fill materials and adjacent to quarrying activities, and potentially the Facility's operations. This work plan has been specifically designed to present results and interpretation of the historical and current data and to define steps moving ahead to address groundwater quality.

The following sections discuss the results of the assessment and describe the proposed work plan.

2.0 2013 Data Assessment - Ammonia

Interpretations of pre-2013 analytical data identified the existence of an ammonia plume within shallow groundwater originating near the eastern side of the organics composting facility and migrating to the northeast towards the Site boundary. Elevated concentrations of ammonia were originally reported in historic monitoring well MW101-09 in May 2010. Elevated ammonia concentrations were detected in monitoring wells located downgradient of MW101-09 during subsequent monitoring events. Ammonia concentrations were observed to increase within the interpreted source area (MW101-09) and downgradient Site boundary monitoring wells (MW5-09, MW102-09) through 2012. Based on a review of 2013 data, elevated ammonia concentrations are persistent within the source area and concentrations continued to increase through 2013 at the downgradient monitoring wells. The Site groundwater monitoring network is illustrated on the attached Site Plan (Figure 1).

Monitoring well MW101-09 was abandoned during 2012 due to suspicions that the well integrity may have been compromised. In addition, several new monitoring wells were installed near the interpreted source area in early 2013. The analytical results from the initial year of sampling at MW101-13 and MW104-13 confirm that elevated concentrations of ammonia exist immediately downgradient of former historic monitoring well MW101-09. The analytical results from MW105-13 show that the elevated concentrations of ammonia are also present to the northeast of MW101-09.

Figures 2 through 7 illustrate ammonia concentrations versus time for the monitoring wells within the source area and downgradient along the Site boundary. As depicted in the Figures, ammonia concentrations have demonstrated increasing trends at monitoring wells MW104-13, MW5-09, MW102-09, and MW101-13.

3.0 Additional Parameters of Concern

A comparison of the 2012 through 2013 analytical data for downgradient monitoring wells (MW5-09, MW102-09, MW1-08) located along the northern Property boundary to the Ontario Drinking Water Standards (ODWS) and upgradient water quality at MW3-08 was completed to identify additional parameters of potential environmental concern within shallow groundwater. Based on this comparison,

several general chemistry and metals parameters have been reported at concentrations above their respective ODWS criteria, and significantly elevated above upgradient levels. The following additional parameters have been identified as potential parameters of concern. The maximum reported downgradient, Site boundary concentrations and respective ODWS criteria (in brackets) are as follows:

- Iron – 7.5 mg/L (0.3 mg/L)
- Manganese – 4.8 mg/L (0.05 mg/L)
- Dissolved Organic Carbon – 12.1 mg/L (10 mg/L)
- Sulfate – 872 mg/L (200 mg/L)
- Total Dissolved Solids – 2030 mg/L (500 mg/L)

It should be noted that, similar to the trend noted for ammonia, the concentrations of the above parameters have generally demonstrated increasing trends during recent years at monitoring wells immediately downgradient of the Facility.

Figures 8 through 11 provide concentration isopleths for ammonia, dissolved organic carbon (DOC), dissolved iron, and dissolved manganese based on the median sample results from 2013 monitoring in monitoring wells completed within the shallow aquifer. Each figure illustrates the presence of elevated concentrations in the interpreted source area and downgradient towards the northern Site boundary. Elevated concentrations of iron, manganese, DOC and TDS are consistent with the interpretation that the contaminant plume is related to an organic contaminant source. As indicated on these figures, there is little known about the western extent of the plume near the northern Site boundary. The proposed work plan for addressing this data gap is discussed in Section 5.3.

4.0 Groundwater Discharge to Surface

The presence of elevated ammonia concentrations within shallow groundwater is primarily a potential concern with respect to the discharge of shallow groundwater to surface water, due to the relatively low Provincial Water Quality Objective (PWQO) for un-ionized ammonia (0.02 mg/L). As such, it is recommended that the hydraulic relationship between shallow groundwater and surface water be investigated through the installation of staff gauges and measurement of static water levels in both shallow groundwater and surface water. The work plan for addressing this investigation is discussed in Section 5.3.

5.0 Data Gap-Analysis

There is sufficient evidence to confirm that a plume exists on-Site within the shallow groundwater adjacent to and downgradient of the Facility. The available groundwater quality data suggests that the plume consists of organics-related contaminants with elevated concentrations of ammonia. As part of the data assessment, CRA completed a data-gap analysis to identify areas where important information is unavailable concerning the contaminant nature, distribution or fate.

The following sections discuss the identified data gaps and outline the proposed action items for addressing the data gaps. Completing these action items forms the basis of the proposed work plan.

5.1 Surface Water Levels

As discussed previously, elevated ammonia concentrations within groundwater can be an issue of environmental concern when groundwater discharges to surface water, as the PWQO for un-ionized ammonia is low (0.02 mg/L). As such, it is important to understand whether or not shallow groundwater discharges to surface water at the Site to determine if the elevated ammonia concentrations are entering the surface water regime.

The comparison of shallow groundwater elevations with adjacent/nearby surface water elevations during quarterly monitoring events will determine whether or not groundwater is discharging to surface. As such, a series of staff gauges will be installed within the ditch along the north side of the Site (and any other on-Site surface water features, as appropriate). These staff gauges will be surveyed for geodetic reference. Surface water elevation measurements will then be incorporated into the monitoring program during each monitoring event. These measurements will be completed for a minimum of one year in order to observe the shallow groundwater - surface water relationship in different seasons.

Recommendations concerning the potential continuation of monitoring in the ditch will be made following one year of monitoring.

5.2 Complete Topographic Site Survey

It is understood that an as-built topographical survey of the site is unavailable. Accurate comparison of ground water levels to site grades is needed to verify if groundwater is discharging to the Site's surface water bodies. As such, an up to date topographical survey will be completed so this interface can be accurately assessed. The topographic survey will also be used to verify the pond levels and the outflow levels from the site into the Hawthorne Industrial Park.

5.3 Additional Monitoring Data

Groundwater

Although the current monitoring network has adequately identified the presence of an ammonia plume, the western extent of the contaminant plume along the northern Site boundary is currently unknown. Therefore, a shallow groundwater monitoring well will be installed to the west of MW5-09, as indicated on Figure 1 to better define the western extent of the plume. The proposed monitoring well will be incorporated into the regular monitoring program for quarterly sampling until sufficient data is gathered to warrant a monitoring reduction.

Surface Water

As discussed in Section 5.1, four (4) surface water staff gauges will be installed within the ditch along the north end of the Site in order to measure water levels within the ditch. The staff gauges will be geodetically surveyed so that measured water levels can be converted into static elevations. These static

elevations will be compared to the static groundwater elevations in adjacent groundwater monitoring wells to determine if shallow groundwater is discharging to this ditch. The proposed surface water staff gauge locations are illustrated on Figure 1.

5.4 Hydraulic Testing

In order to have a thorough understanding of the hydraulic characteristics of the shallow overburden and bedrock aquifers, additional testing of the aquifer properties will be completed along the northern Site boundary. This testing will be accomplished through single well response tests on the existing and proposed shallow groundwater monitoring wells in this area (MW5-09, MW102-09 and the proposed monitoring well).

The results of this testing will be used to better estimate the aquifer properties along the northern Site boundary.

6.0 Groundwater Remediation

In response to the identified groundwater plume, a single shallow groundwater extraction well will be installed near the ammonia scrubber. Based on the nature of the contaminants observed, the contaminant distribution and the interpreted source of leakage, the area immediately downgradient of the ammonia scrubber is considered the most suitable location for a remediation/extraction well.

The purpose of the extraction well will be to remove the most heavily impacted groundwater from the subsurface for use in the Facility process. Up to 15,000 L of groundwater can be used in the process daily. As such, this source removal strategy represents an ideal opportunity to control a significant portion of the plume without the need for treatment or trucking to a disposal facility.

7.0 Closing

It is anticipated that the installation of an additional monitoring well, a remediation/extraction well and establishment of surface water staff gauges will occur during the summer of 2014. The monitoring points will be incorporated into the regular monitoring program during the next regularly scheduled monitoring event.

The results of the above-described work program, including recommendations for next steps, will be provided to the MOE in a letter report following completion of the assessment.

We trust this to be complete and in order for your use. Should you have any questions, please do not hesitate to contact our office.

Mailing Address (Street Number/Name)	Municipality	Province	Postal Code	Telephone No. (inc. area code)
c/o 32 Steacie Drive	Kanata	Ontario	K2K2A9	613 592 6600

Well Location

Address of Well Location (Street Number/Name)	Township	Lot	Concession
TW #6 - Rideau Rd.	Gloucestor	26	6

County/District/Municipality	City/Town/Village	Province	Postal Code
Ottawa Carleton	Gloucestor	Ontario	

UTM Coordinates	Zone	Easting	Northing	Municipal Plan and Sublot Number	Other
NAD	83	18457102501760			

Overburden and Bedrock Materials/Abandonment Sealing Record (see instructions on the back of this form)

General Colour	Most Common Material	Other Materials	General Description	Depth (m/ft) From	Depth (m/ft) To
Brown	Clay		Packed	0	3.65
Gray	Clay	Stones	Sticky	3.65	9.14
Gray	Shale		Soft	9.14	42.66
Gray	Limestone		Medium-Soft	42.66	83.20

Annular Space

Depth Set at (m/ft) From	To	Type of Sealant Used (Material and Type)	Volume Placed (m³/ft³)
17.67	0	Grouted Cement	.525m³

Method of Construction

☐ Cable Tool ☐ Diamond
☐ Rotary (Conventional) ☐ Jetting
☐ Rotary (Reverse) Air ☐ Driving
☐ Boring ☐ Digging
☐ Air percussion
☐ Other, specify

Well Use

☐ Public ☒ Commercial ☐ Not used
☒ Domestic ☐ Municipal ☐ Dewatering
☐ Livestock ☐ Test Hole ☐ Monitoring
☐ Irrigation ☐ Cooling & Air Conditioning
☒ Industrial
☐ Other, specify Test Well

Construction Record - Casing

Inside Diameter (cm/in)	Open Hole OR Material (Galvanized, Fibreglass, Concrete, Plastic, Steel)	Wall Thickness (cm/in)	Depth (m/ft) From	Depth (m/ft) To
15.86	Steel	.48	+.60	17.67

Status of Well

☐ Water Supply
☐ Replacement Well
☐ Test Hole
☐ Recharge Well
☐ Dewatering Well
☐ Observation and/or Monitoring Hole
☐ Alteration (Construction)
☐ Abandoned, Insufficient Supply
☐ Abandoned, Poor Water Quality
☐ Abandoned, other, specify
☐ Other, specify

Construction Record - Screen

Outside Diameter (cm/in)	Material (Plastic, Galvanized, Steel)	Slot No.	Depth (m/ft) From	Depth (m/ft) To

Water Details

Water found at Depth (m/ft)	Kind of Water: ☐ Fresh ☐ Untested ☐ Gas ☐ Other, specify
Water found at Depth (m/ft)	Kind of Water: ☐ Fresh ☐ Untested ☐ Gas ☐ Other, specify
Water found at Depth (m/ft)	Kind of Water: ☐ Fresh ☐ Untested ☐ Gas ☐ Other, specify

Hole Diameter

Depth (m/ft) From	To	Diameter (cm/in)
0	17.67	15.86
17.67	83.20	15.23

Results of Well Yield Testing

After test of well yield, water was:
☐ Clear and sand free
☐ Other, specify

If pumping discontinued, give reason:

Pump intake set at (m/ft): 79.24

Pumping rate (l/min / GPM): 13.65

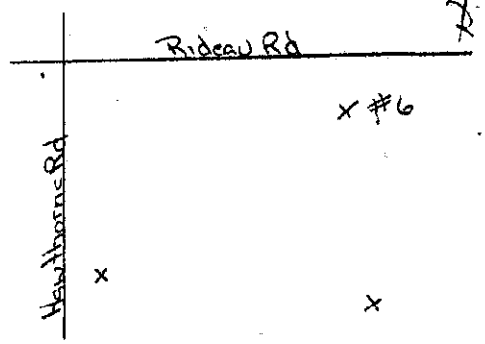
Duration of pumping: 6 hrs + ____ min

Final water level end of pumping (m/ft): 30.57

If flowing give rate (l/min / GPM):

Recommended pump depth (m/ft): 60.95

Recommended pump rate (l/min / GPM): 13.65



Well production (l/min / GPM):

Disinfected? ☐ Yes ☒ No

	Draw Down Time (min)	Draw Down Water Level (m/ft)	Recovery Time (min)	Recovery Water Level (m/ft)
	Static Level	3.18		
	1	3.24	1	
	2	4.23	2	
	3	5.19	3	
	4		4	
	5	6.53	5	
	10	8.06	10	
	15	9.99	15	22.80
	20	11.53	20	19.40
	25	12.92	25	17.12
	30	14.08	30	15.13
	40		40	11.82
	50		50	9.47
	60		60	7.94

Map of Well Location

Please provide a map below following instructions on the back.

Comments:

Well Contractor and Well Technician Information

Business Name of Well Contractor	Well Contractor's Licence No.
Capital Water Supply Ltd.	1558

Business Address (Street Number/Name)	Municipality
Box 490	Stittsville

Province	Postal Code	Business E-mail Address
Ontario	K2S1A6	office@capitalwater.ca

Bus. Telephone No. (inc. area code)	Name of Well Technician (Last Name, First Name)
6138361765	Miller, Stephen

Well Technician's Licence No.	Signature of Technician and/or Contractor	Date Submitted
0097		2008/09/26

Well owner's information package delivered	Date Package Delivered	Ministry Use Only
☐ Yes ☒ No	2008/09/26	Audit No. Z 084110

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Total Suspended Solids	DLHC	L1733803-1, -2, -3, -5, -6, -7, -8, -9
Duplicate	Total Suspended Solids	DLHC	L1733803-4
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L1733803-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Total Kjeldahl Nitrogen	MS-B	L1733803-2, -5, -6, -7, -8, -9
Matrix Spike	Phosphorus, Total	MS-B	L1733803-1, -2, -3, -4, -5, -6, -7, -8, -9

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
PEHT	Parameter Exceeded Recommended Holding Time Prior to Analysis
RRR	Refer to Report Remarks for issues regarding this analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT Water Dissolved Organic Carbon APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT Water Chloride by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-WT Water Chemical Oxygen Demand APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT Water Colour APHA 2120

Apparent colour is determined by analysis of the decanted sample using the platinum-cobalt colourimetric method.

EC-MF-WT Water E. coli SM 9222D

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h.
Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT Water Un-ionized ammonia CALCULATION

F1-F4-CALC-WT Water CCME Total Hydrocarbons CCME CWS-PHC, Pub #1310, Dec 2001-L

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:

Reference Information

1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT Water F1 (O.Reg.153/04) E3421/CCME (HS)

Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT Water F2-F4 (O.Reg.153/04) MOE DECPH-E3421/CCME TIER 1

The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The extracts are treated with silica gel to remove polar contaminants. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT Water Fecal Coliforms SM 9222D

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-D-CVAA-WT Water Dissolved Mercury in Water by CVAAS EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-D-CCMS-WT Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT Water Ammonia, Total as N EPA 350.1

Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT Water Nitrite in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT Water Nitrate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT Water CCME PAHs SW846 8270

Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT Water pH & Temperature Results supplied by client

PH-WT Water pH APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT Water Phenol (4AAP) EPA 9066

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-WT Water Sulfate in Water by IC EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT Water Total Dissolved Solids APHA 2540C
A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

SOLIDS-TSS-WT Water Suspended solids APHA 2540 D-Gravimetric
A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT Water Total Coliforms SM 9222B
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT Water Total Kjeldahl Nitrogen APHA 4500-N
Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT Water Turbidity APHA 2130 B
Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

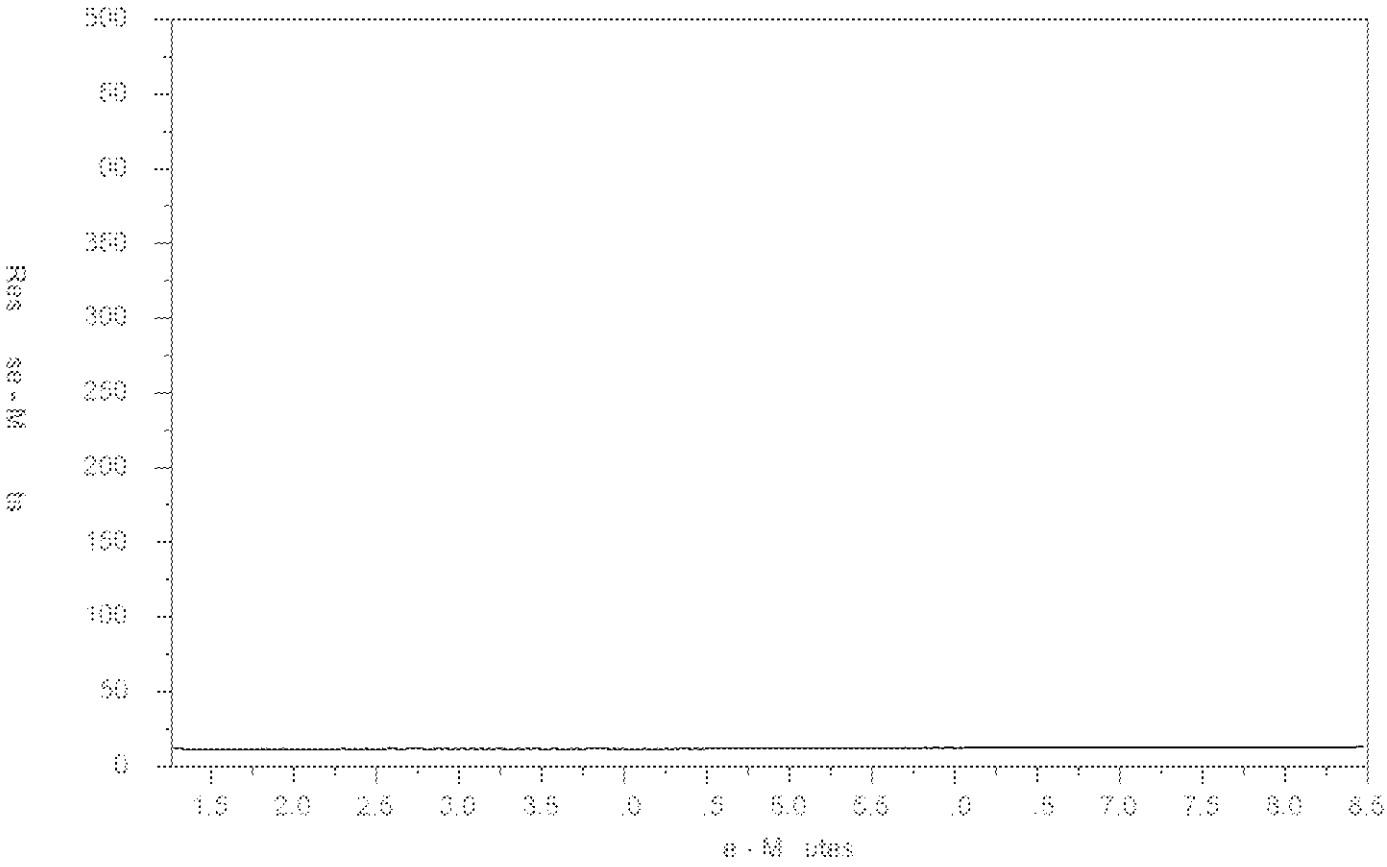
Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1733803 were received on 10-FEB-16 15:30.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

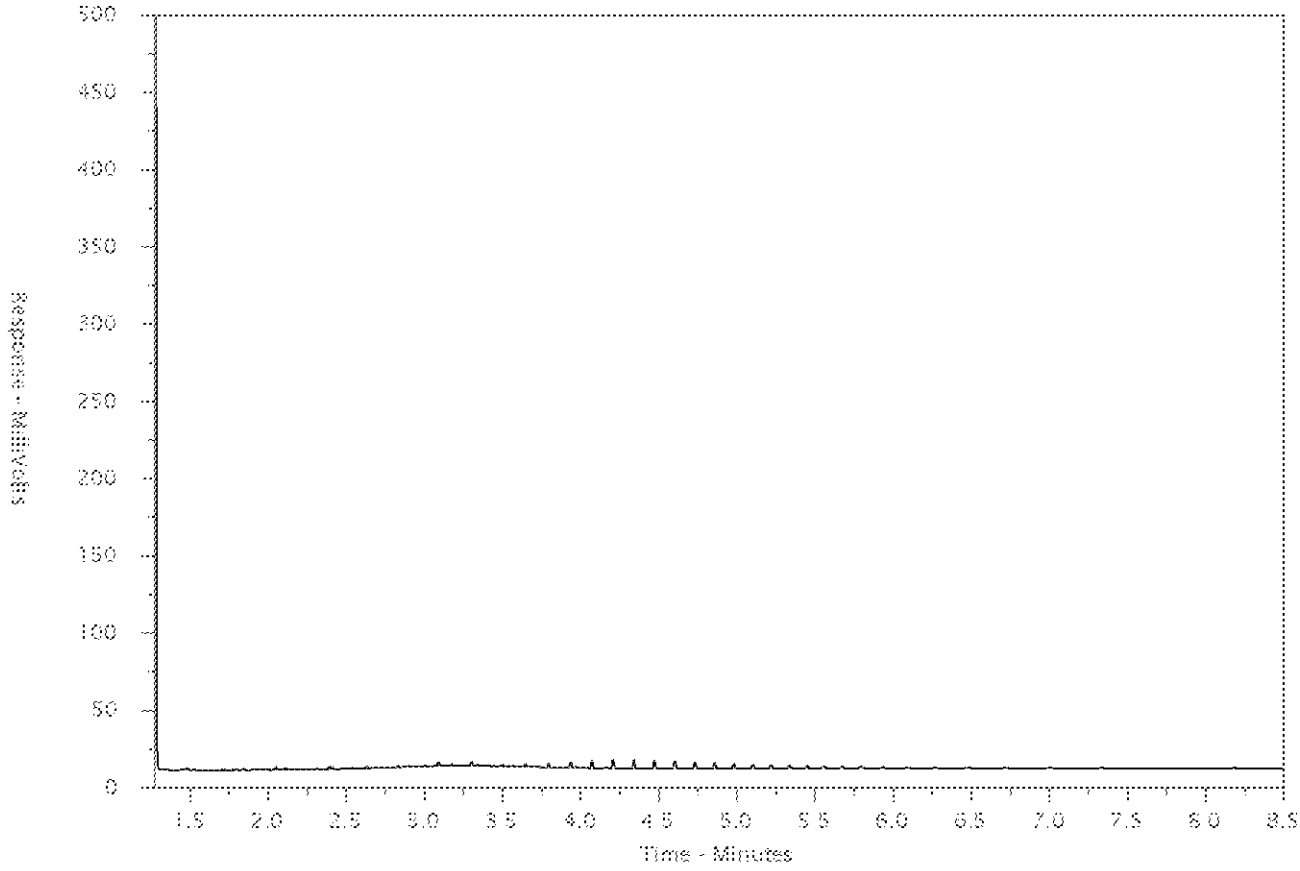
←Diesel/ Jet Fuels→			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

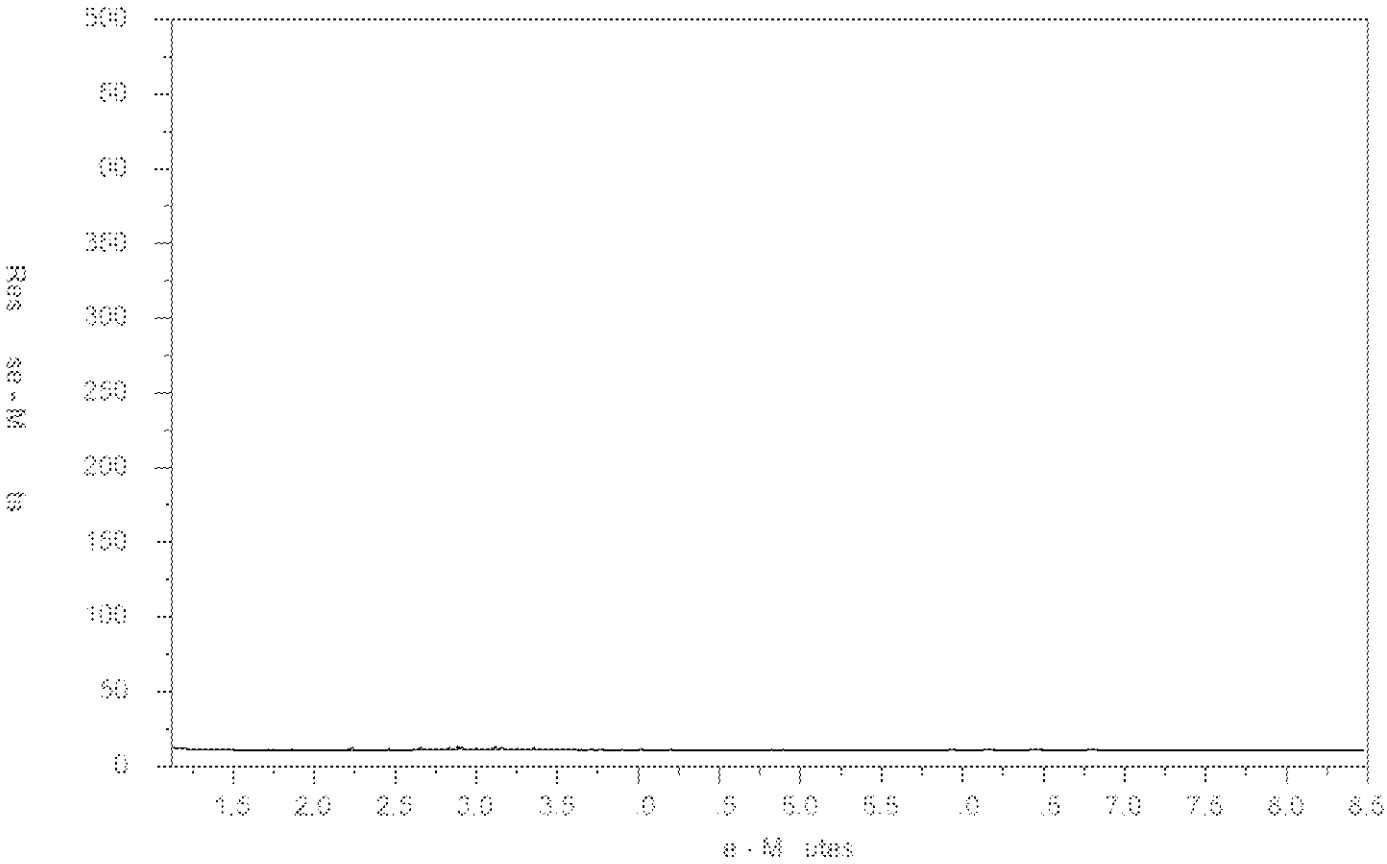
The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Matrix Spike	COD	MS-B	L1769313-1, -2, -3, -4, -5

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT Water Dissolved Organic Carbon APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT Water Chloride by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-T-WT Water Chemical Oxygen Demand APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT Water Colour APHA 2120

Apparent Colour is measured spectrophotometrically by comparison to platinum-cobalt standards using the single wavelength method after sample decanting. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MF-WT Water E. coli SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h.
Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT Water Un-ionized ammonia CALCULATION

F1-F4-CALC-WT Water CCME Total Hydrocarbons CCME CWS-PHC, Pub #1310, Dec 2001-L

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Reference Information

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT Water F1 (O.Reg.153/04) E3421/CCME (HS)
Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT Water F2-F4 (O.Reg.153/04) MOE DECPH-E3421/CCME TIER 1
The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The extracts are treated with silica gel to remove polar contaminants. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT Water Fecal Coliforms SM 9222D
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-T-CVAA-WT Water Total Mercury in Water by CVAAS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

MET-T-MS-WT Water Total Metals in Water by ICPMS EPA 200.8
This analysis involves preliminary sample treatment by hotblock acid digestion (APHA 3030E). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

NH3-WT Water Ammonia, Total as N EPA 350.1
Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT Water Nitrite in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT Water Nitrate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P B E

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT Water CCME PAHs SW846 8270
Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT Water pH & Temperature Results supplied by client

PH-WT Water pH APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT Water Phenol (4AAP) EPA 9066
An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

Reference Information

SO4-IC-N-WT	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT	Water	Total Dissolved Solids	APHA 2540C

A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT	Water	Total Coliforms	SM 9222B

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT	Water	Turbidity	APHA 2130 B

Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

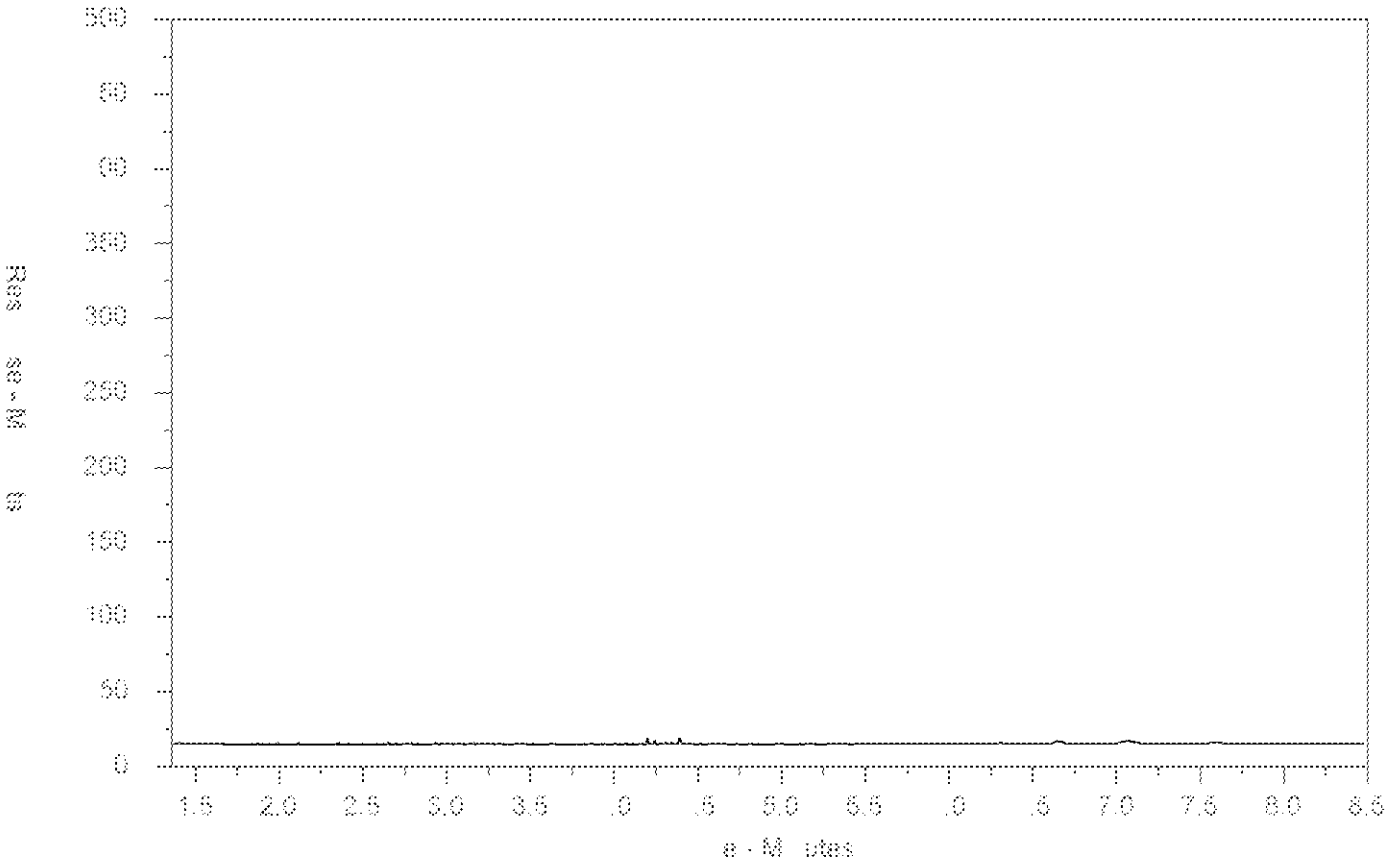
Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1769313-1
Client Sample ID: SW-45804-051616-TS-001

← F2 →	← F3 →	← F4 →	
nC10	nC16	nC34	nC50

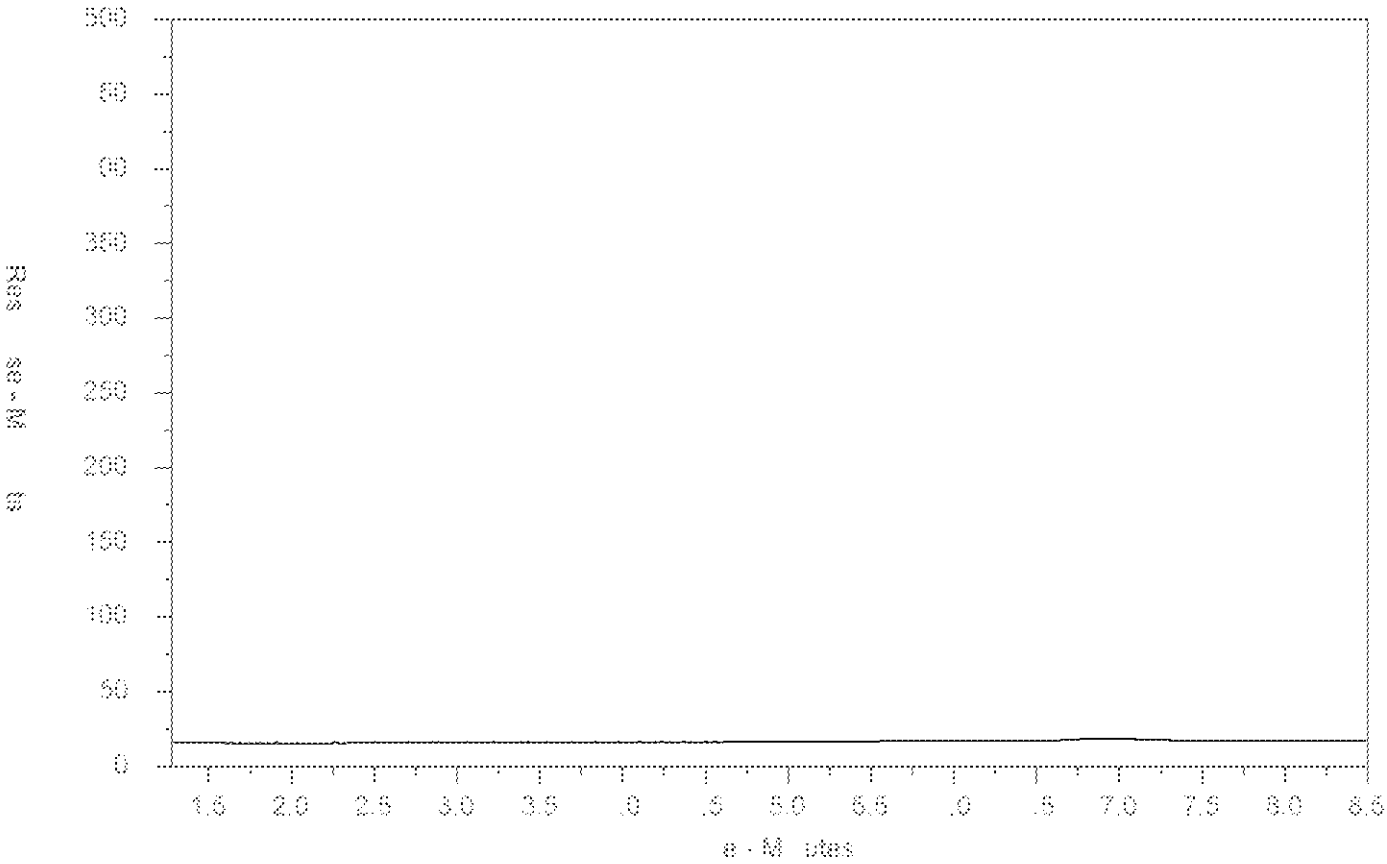
346°F	549°F	898°F	1067°F
← Gasoline →		← Motor Oils/ Lube Oils/ Grease →	
← Diesel/ Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

L1769313-COFC

SPECIAL INSTRUCTIONS/COMMENTS

PLEASE INCLUDE FIELD PH AND FIELD TEMP FOR UN-IONIZED AMMONIA CALCULATION.
GROUNDWATER METALS ARE FIELD FILTERED.
********** Short Hold Time for Micro & Turbidity **********

45804-GW-P-WT List: Alk, CBOD, DOC, anions 4, COD, Colour, Micro (EC,TC,FC), F1-F4, Diss. Metals & Hg, TP, PAH, NH3, Phenols, TDS, TSS, TKN, Turbidity
45804-SW-P-WT List: Alk, CBOD, DOC, anions 4, COD, Colour, Micro (EC,TC,FC), F1-F4, Tot. Metals & Hg, TP low-level, PAH, NH3, Phenols, TDS, TSS, TKN, Turbidity

SAMPLE CONDITION: FROZEN / COLD / COOLING INITIATED / AMBIENT — MEAN TEMP 11.4
CONDITION ACCEPTABLE UPON RECEIPT (Y/N) ____ — INIT S

Matrix Spike	COD	MS-B	L1770123-1, -2, -3, -4, -5, -6, -7, -8, -9

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT Water Dissolved Organic Carbon APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT Water Chloride by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-T-WT Water Chemical Oxygen Demand APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT Water Colour APHA 2120

Apparent Colour is measured spectrophotometrically by comparison to platinum-cobalt standards using the single wavelength method after sample decanting. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MF-WT Water E. coli SM 9222D

Reference Information

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h. Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT	Water	Un-ionized ammonia	CALCULATION

F1-F4-CALC-WT	Water	CCME Total Hydrocarbons	CCME CWS-PHC, Pub #1310, Dec 2001-L

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT	Water	F1 (O.Reg.153/04)	E3421/CCME (HS)

Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT	Water	F2-F4 (O.Reg.153/04)	MOE DECPH-E3421/CCME TIER 1

The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The extracts are treated with silica gel to remove polar contaminants. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT	Water	Fecal Coliforms	SM 9222D

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-D-CVAA-WT	Water	Dissolved Mercury in Water by CVAAS	EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-D-CCMS-WT	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT	Water	Ammonia, Total as N	EPA 350.1

Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P B E

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT	Water	CCME PAHs	SW846 8270

Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT	Water	pH & Temperature	Results supplied by client
PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT	Water	Phenol (4AAP)	EPA 9066

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-WT	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT	Water	Total Dissolved Solids	APHA 2540C

A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT	Water	Total Coliforms	SM 9222B

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT	Water	Turbidity	APHA 2130 B

Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

179 Colonnade Road, Suite 400
Ottawa ON K2E 7J4
Contact: AIRESSE MACPHEE

Legend:

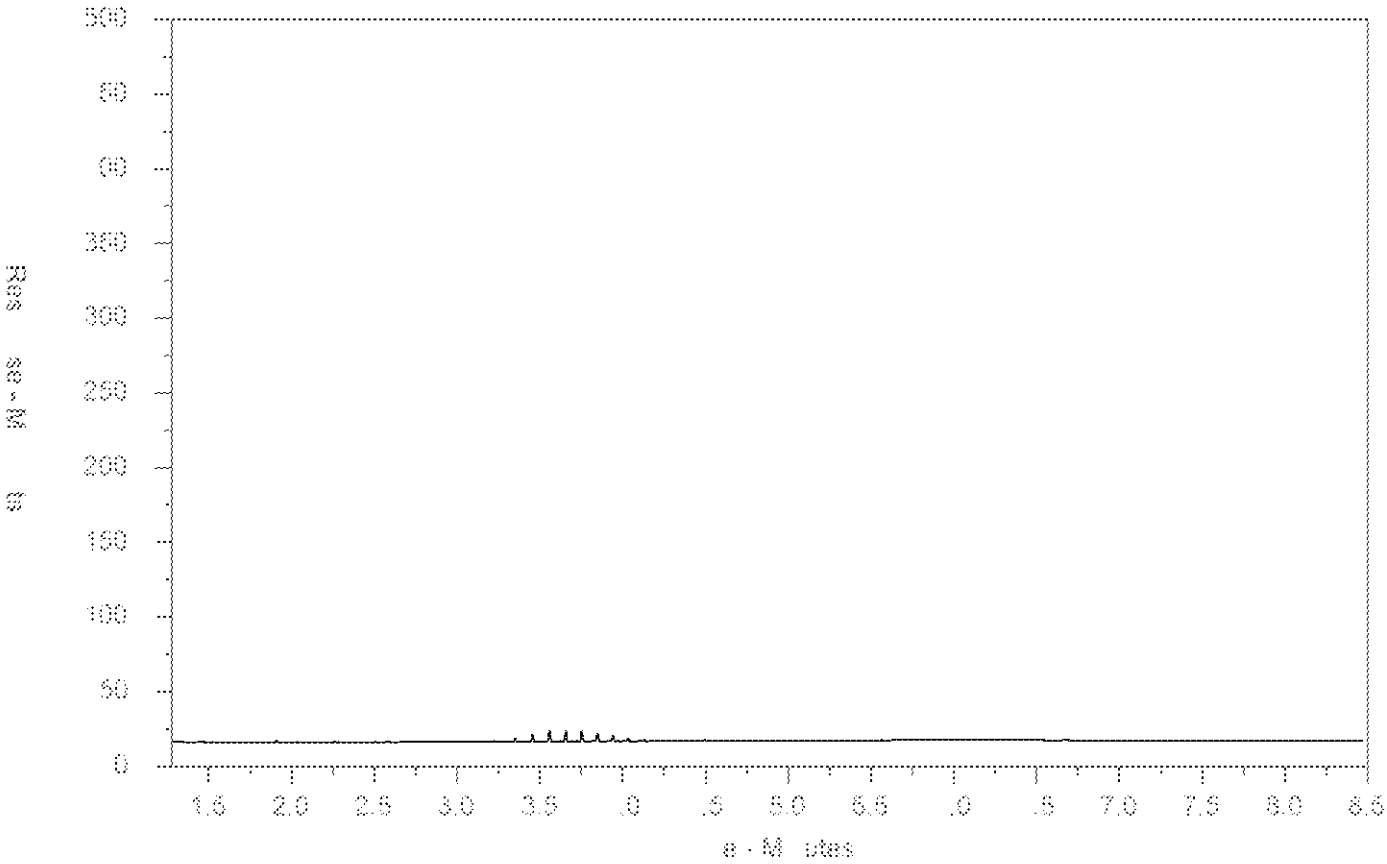
Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1770123-1
Client Sample ID: GW-45804-051716-TS-001

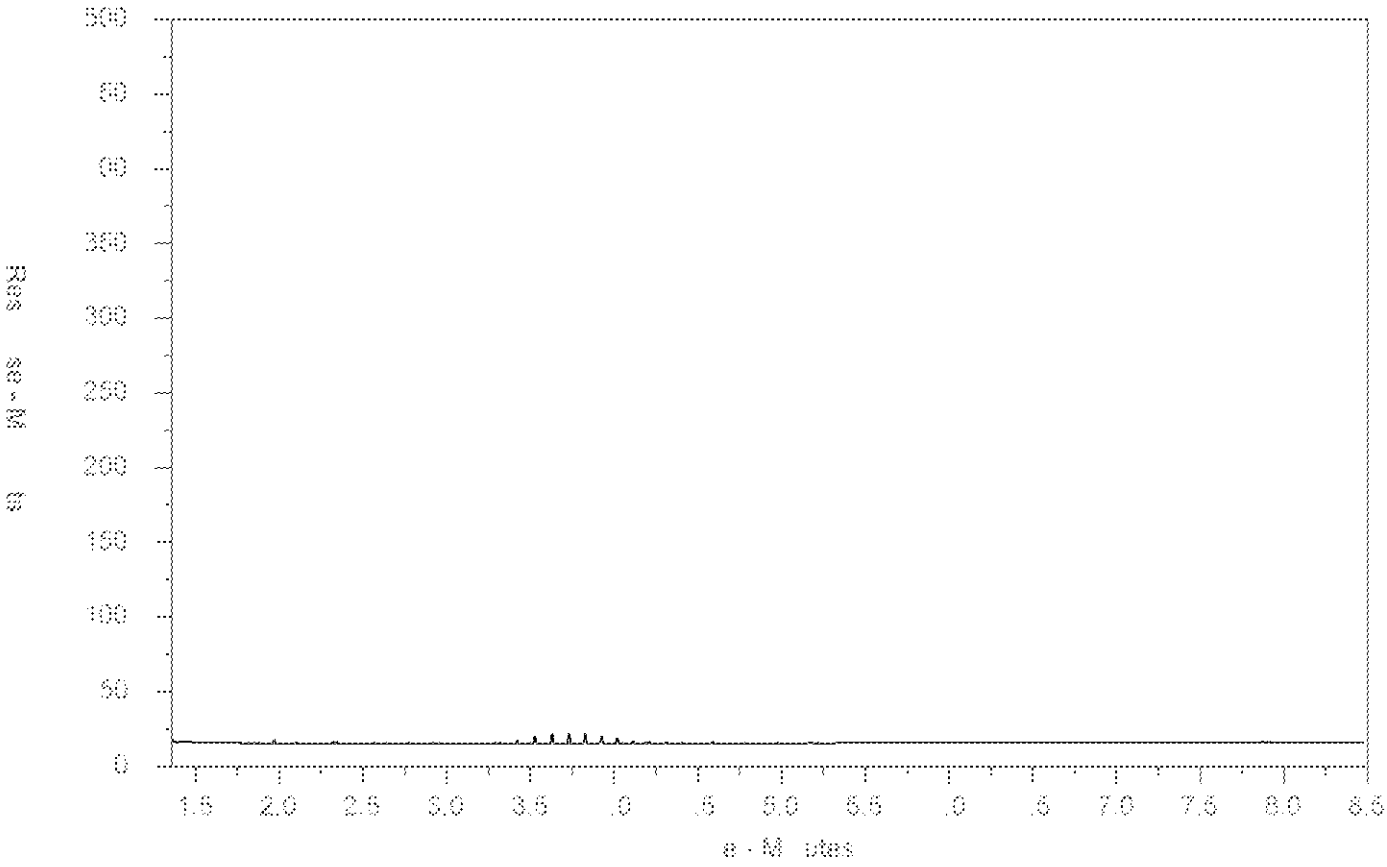
← Gasoline →		← Motor Oils/ Lube Oils/ Grease →	
← Diesel/ Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

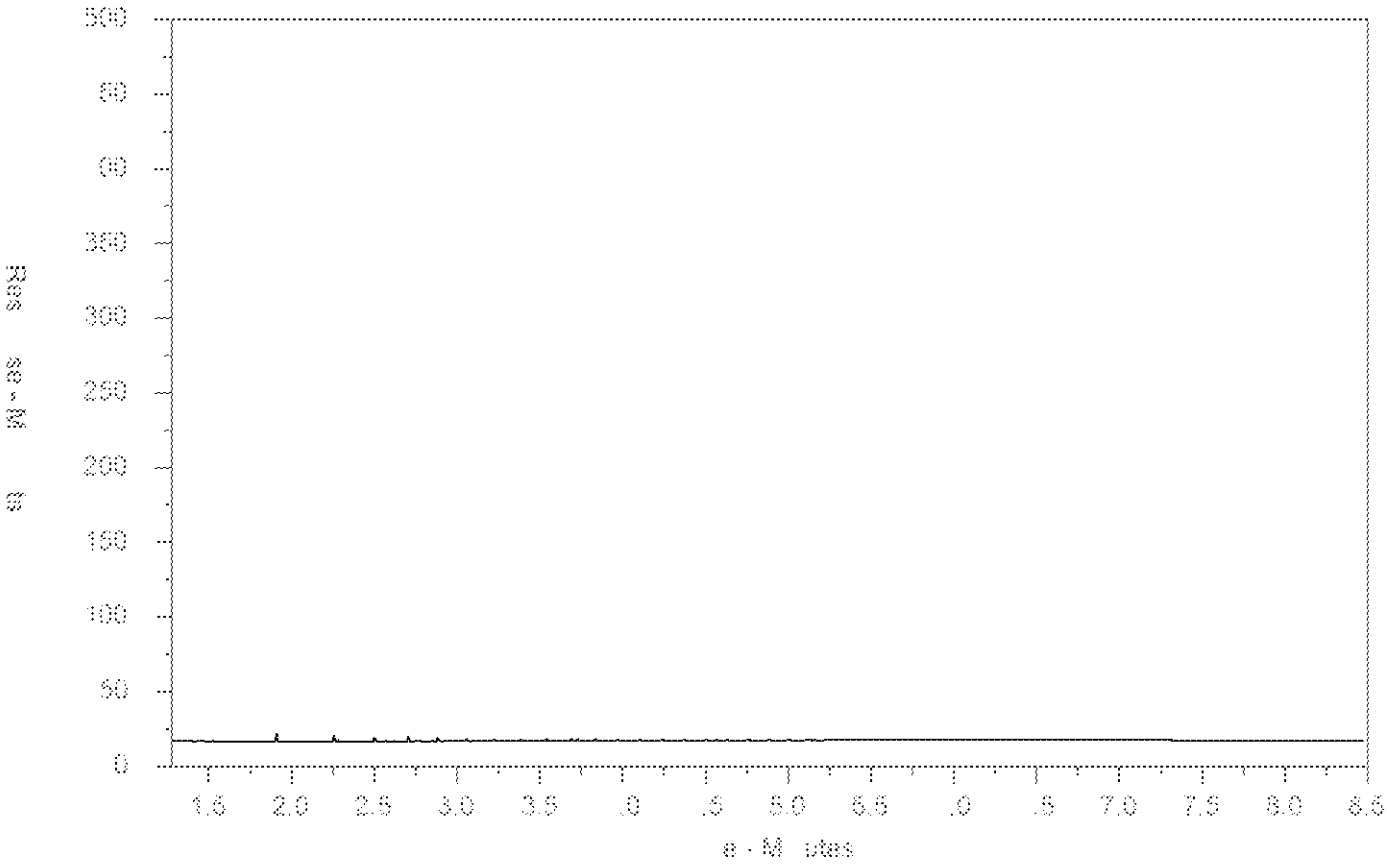
The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Total Suspended Solids	DLHC	L1771020-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfate (SO4)	MS-B	L1771020-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Total Kjeldahl Nitrogen	MS-B	L1771020-1, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	COD	MS-B	L1771020-1, -2, -3, -4, -5, -6, -7, -8, -9

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
SURR-ND	Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT Water Dissolved Organic Carbon APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT Water Chloride by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-T-WT Water Chemical Oxygen Demand APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT Water Colour APHA 2120

Apparent Colour is measured spectrophotometrically by comparison to platinum-cobalt standards using the single wavelength method after sample decanting. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MF-WT Water E. coli SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h.
Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT Water Un-ionized ammonia CALCULATION

F1-F4-CALC-WT Water CCME Total Hydrocarbons CCME CWS-PHC, Pub #1310, Dec 2001-L

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.

Reference Information

2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT Water F1 (O.Reg.153/04) E3421/CCME (HS)
Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT Water F2-F4 (O.Reg.153/04) MOE DECPH-E3421/CCME TIER 1
The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The extracts are treated with silica gel to remove polar contaminants. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT Water Fecal Coliforms SM 9222D
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-D-CVAA-WT Water Dissolved Mercury in Water by CVAAS EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-D-CCMS-WT Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT Water Ammonia, Total as N EPA 350.1
Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT Water Nitrite in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT Water Nitrate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P B E

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT Water CCME PAHs SW846 8270
Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT Water pH & Temperature Results supplied by client

PH-WT Water pH APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT Water Phenol (4AAP) EPA 9066

Reference Information

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-WT Water Sulfate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT Water Total Dissolved Solids APHA 2540C
A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

SOLIDS-TSS-WT Water Suspended solids APHA 2540 D-Gravimetric
A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT Water Total Coliforms SM 9222B
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT Water Total Kjeldahl Nitrogen APHA 4500-N
Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT Water Turbidity APHA 2130 B
Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

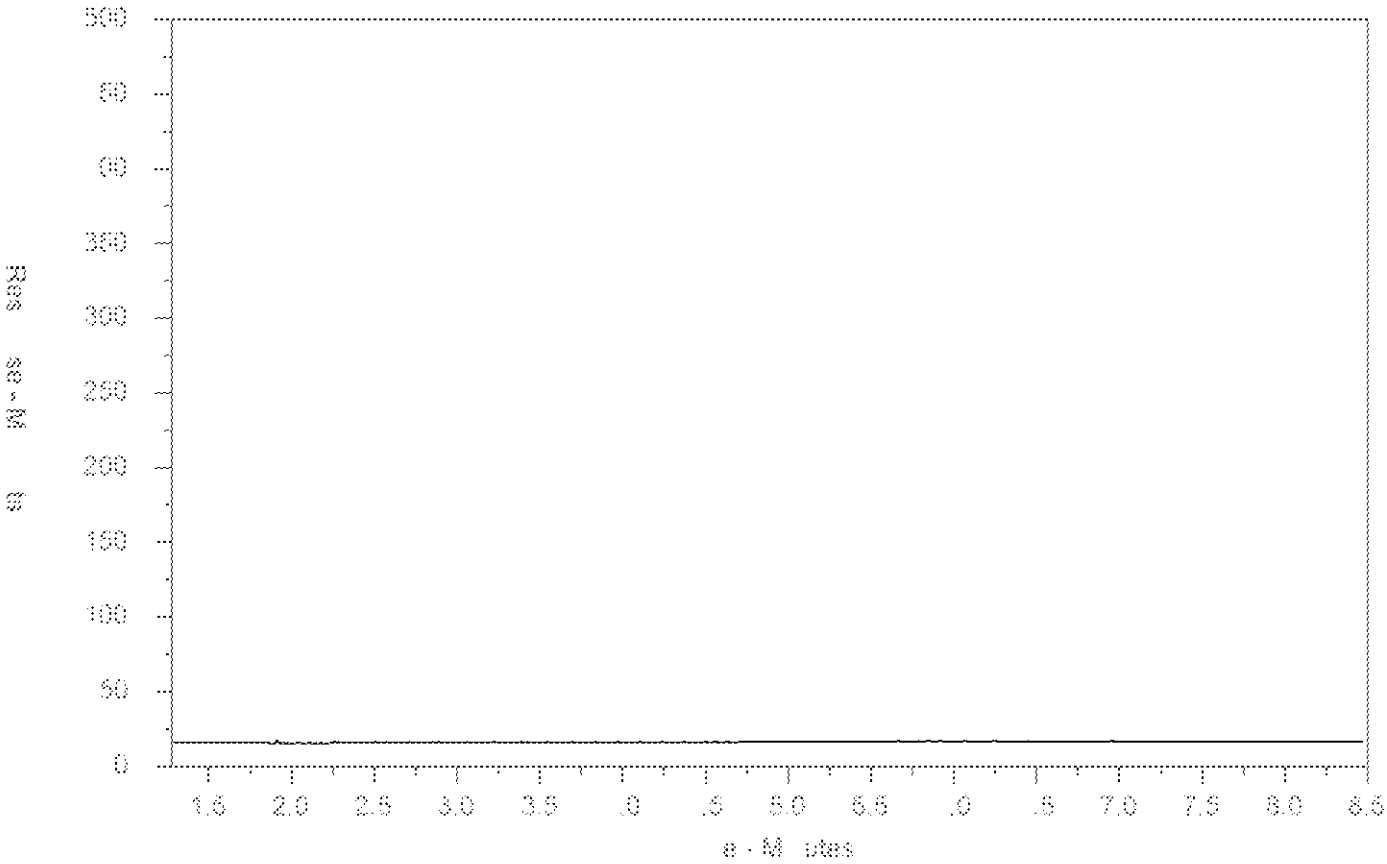
Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

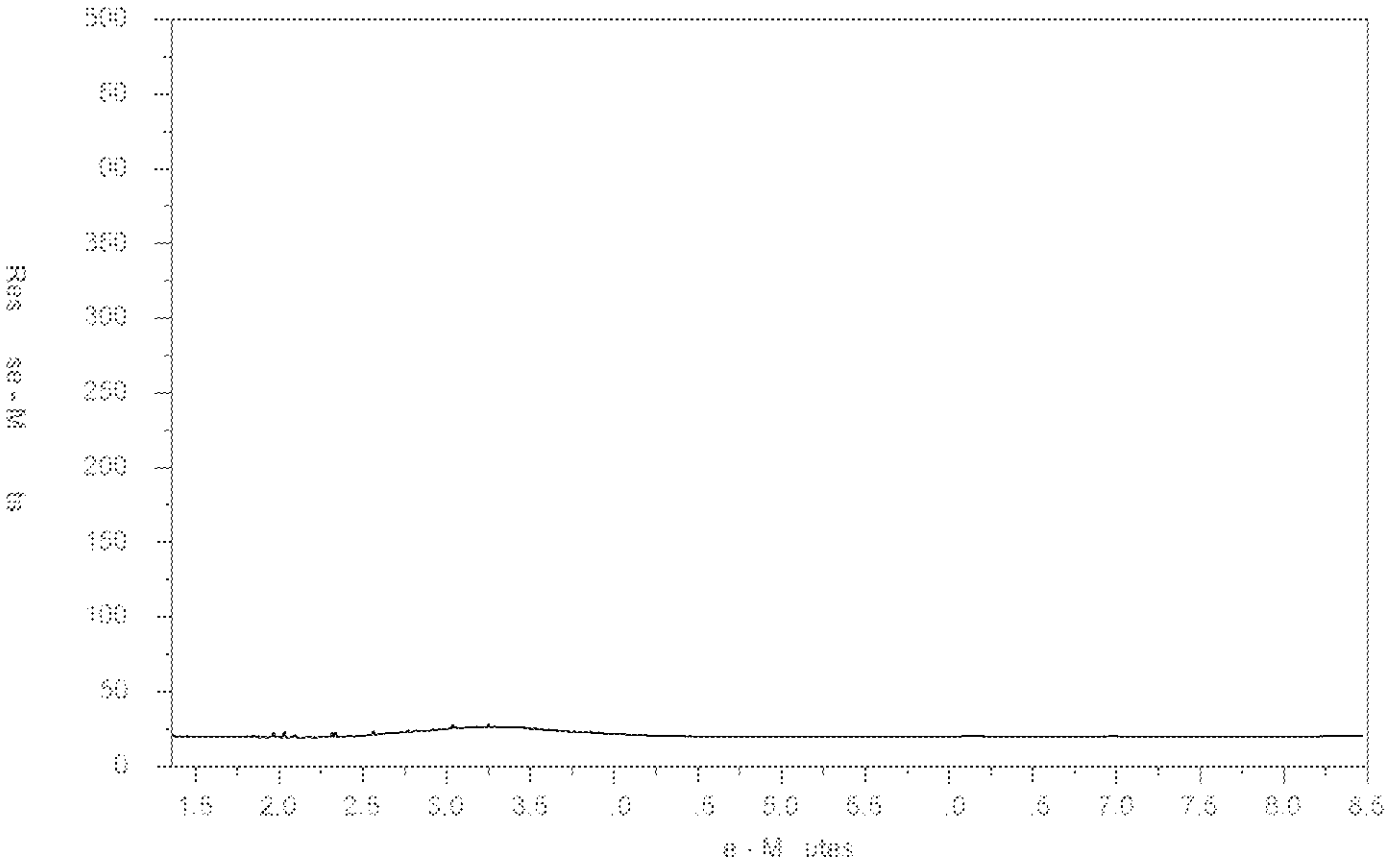
Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1771020-1
Client Sample ID: GW-45804-051816-TS-010

← F2 →	← F3 →	← F4 →	
nC10	nC16	nC34	nC50
174°C	287°C	481°C	575°C
346°F	549°F	898°F	1067°F
← Gasoline →		← Motor Oils/ Lube Oils/ Grease →	
← Diesel/ Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Matrix Spike	Sulfate (SO4)	MS-B	L1814405-1, -2, -3, -4, -5, -6, -7, -8, -9

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT Water Dissolved Organic Carbon APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT Water Chloride by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-T-WT Water Chemical Oxygen Demand APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT Water Colour APHA 2120

Apparent Colour is measured spectrophotometrically by comparison to platinum-cobalt standards using the single wavelength method after sample decanting. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MF-WT Water E. coli SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h. Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT Water Un-ionized ammonia CALCULATION

F1-F4-CALC-WT Water CCME Total Hydrocarbons CCME CWS-PHC, Pub #1310, Dec 2001-L

Reference Information

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.
4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT Water F1 (O.Reg.153/04) E3421/CCME (HS)
Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT Water F2-F4 (O.Reg.153/04) MOE DECPH-E3421/CCME TIER 1
The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The extracts are treated with silica gel to remove polar contaminants. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT Water Fecal Coliforms SM 9222D
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-D-CVAA-WT Water Dissolved Mercury in Water by CVAAS EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-D-CCMS-WT Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT Water Ammonia, Total as N EPA 350.1
Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT Water Nitrite in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT Water Nitrate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT Water CCME PAHs SW846 8270
Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with

Reference Information

benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT	Water	pH & Temperature	Results supplied by client
PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT Water Phenol (4AAP) EPA 9066
An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-WT Water Sulfate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT Water Total Dissolved Solids APHA 2540C
A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

SOLIDS-TSS-WT Water Suspended solids APHA 2540 D-Gravimetric
A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT Water Total Coliforms SM 9222B
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT Water Total Kjeldahl Nitrogen APHA 4500-N
Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT Water Turbidity APHA 2130 B
Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

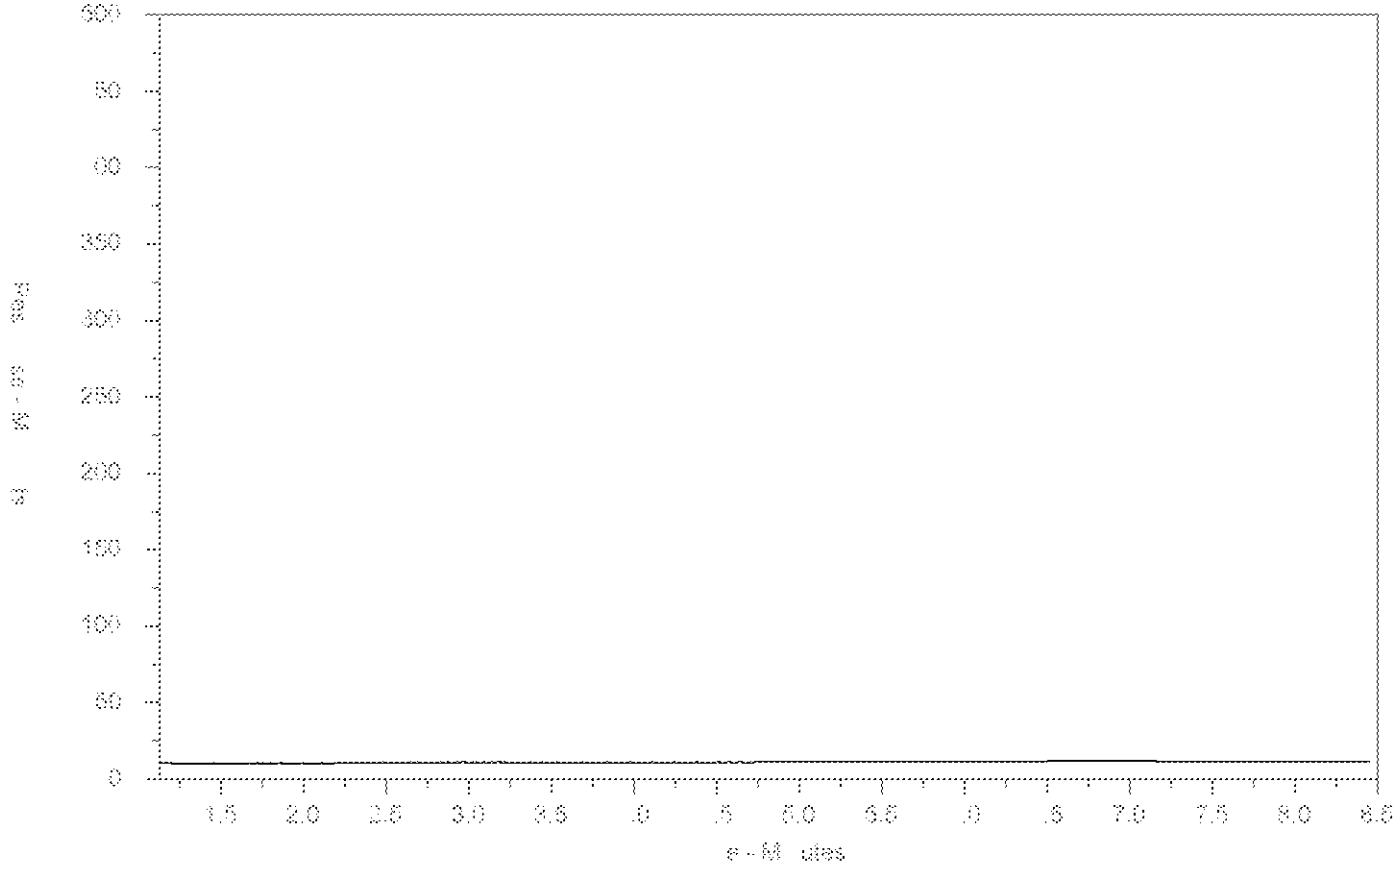
Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1814405-1
Client Sample ID: GW-45804-081616-TS-001

← F2 →	← F3 →	← F4 →

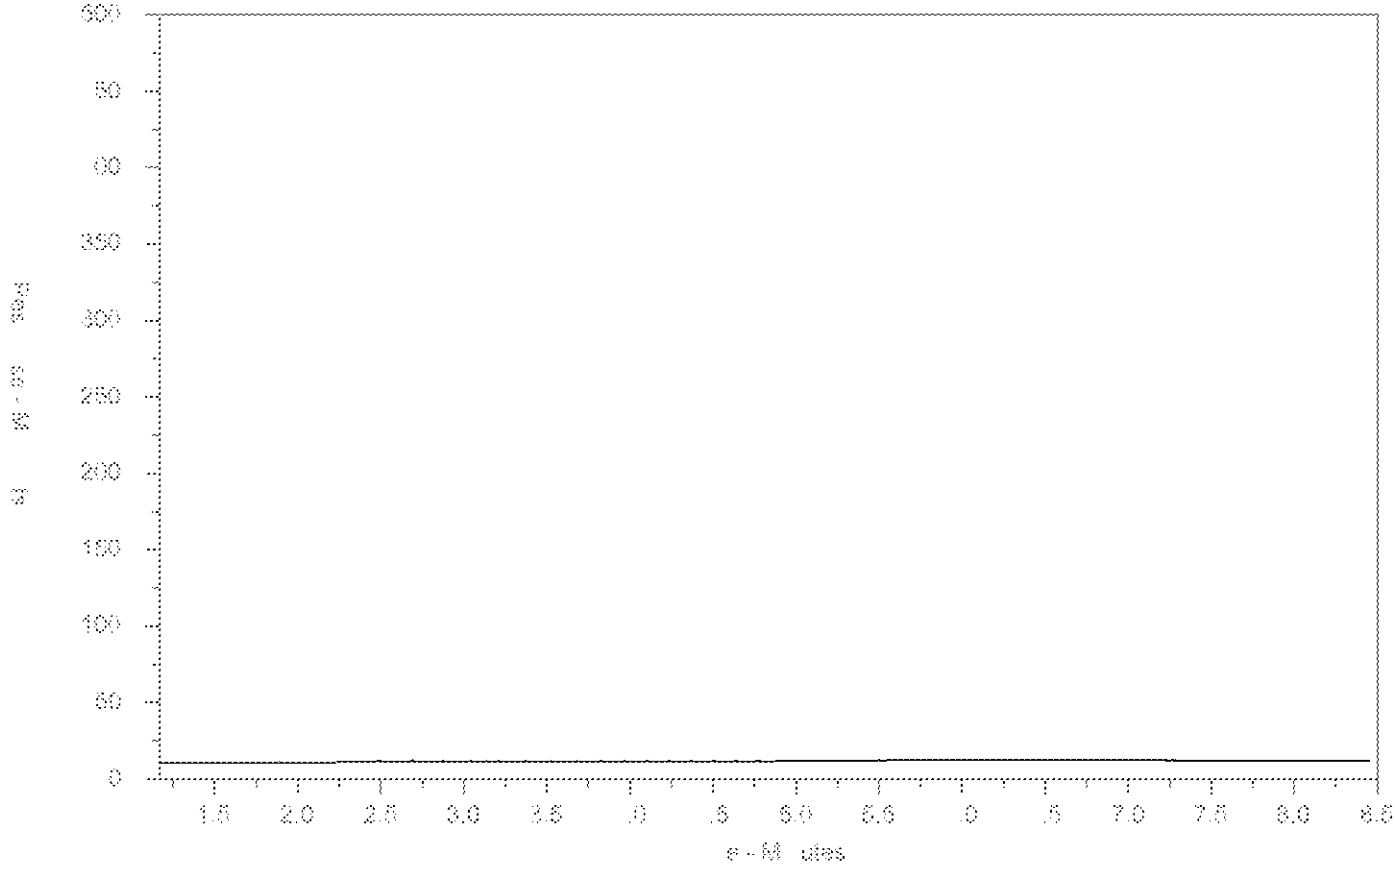
346°F	549°F	898°F	1067°F
← Gasoline →		← Motor Oils/Lube Oils/Grease →	
← Diesel/Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Boron (B)-Total	MS-B	L1857475-1, -2, -3, -4, -5
Matrix Spike	Iron (Fe)-Total	MS-B	L1857475-1, -2, -3, -4, -5
Matrix Spike	Manganese (Mn)-Total	MS-B	L1857475-1, -2, -3, -4, -5
Matrix Spike	Ammonia, Total (as N)	MS-B	L1857475-1, -2, -3, -4, -5

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT	Water	Dissolved Organic Carbon	APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-T-WT	Water	Chemical Oxygen Demand	APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT	Water	Colour	APHA 2120

Apparent Colour is measured spectrophotometrically by comparison to platinum-cobalt standards using the single wavelength method after sample decanting. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MF-WT	Water	E. coli	SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h.
Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT	Water	Un-ionized ammonia	CALCULATION
F1-F4-CALC-WT	Water	CCME Total Hydrocarbons	CCME CWS-PHC, Pub #1310, Dec 2001-L

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.

Reference Information

4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT Water F1 (O.Reg.153/04) E3421/CCME (HS)
Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT Water F2-F4 (O.Reg.153/04) MOE DECPH-E3421/CCME TIER 1
The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT Water Fecal Coliforms SM 9222D
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-T-CVAA-WT Water Total Mercury in Water by CVAAS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

MET-T-CCMS-WT Water Total Metals by CRC ICPMS EPA 200.2/6020A (mod)
Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT Water Ammonia, Total as N EPA 350.1
Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT Water Nitrite in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT Water Nitrate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT Water CCME PAHs SW846 8270
Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT Water pH & Temperature Results supplied by client

PH-WT Water pH APHA 4500 H-Electrode
Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT Water Phenol (4AAP) EPA 9066
An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-WT Water Sulfate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT Water Total Dissolved Solids APHA 2540C
A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

SOLIDS-TSS-WT Water Suspended solids APHA 2540 D-Gravimetric
A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT Water Total Coliforms SM 9222B

Reference Information

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT Water Total Kjeldahl Nitrogen APHA 4500-N
Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT Water Turbidity APHA 2130 B
Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

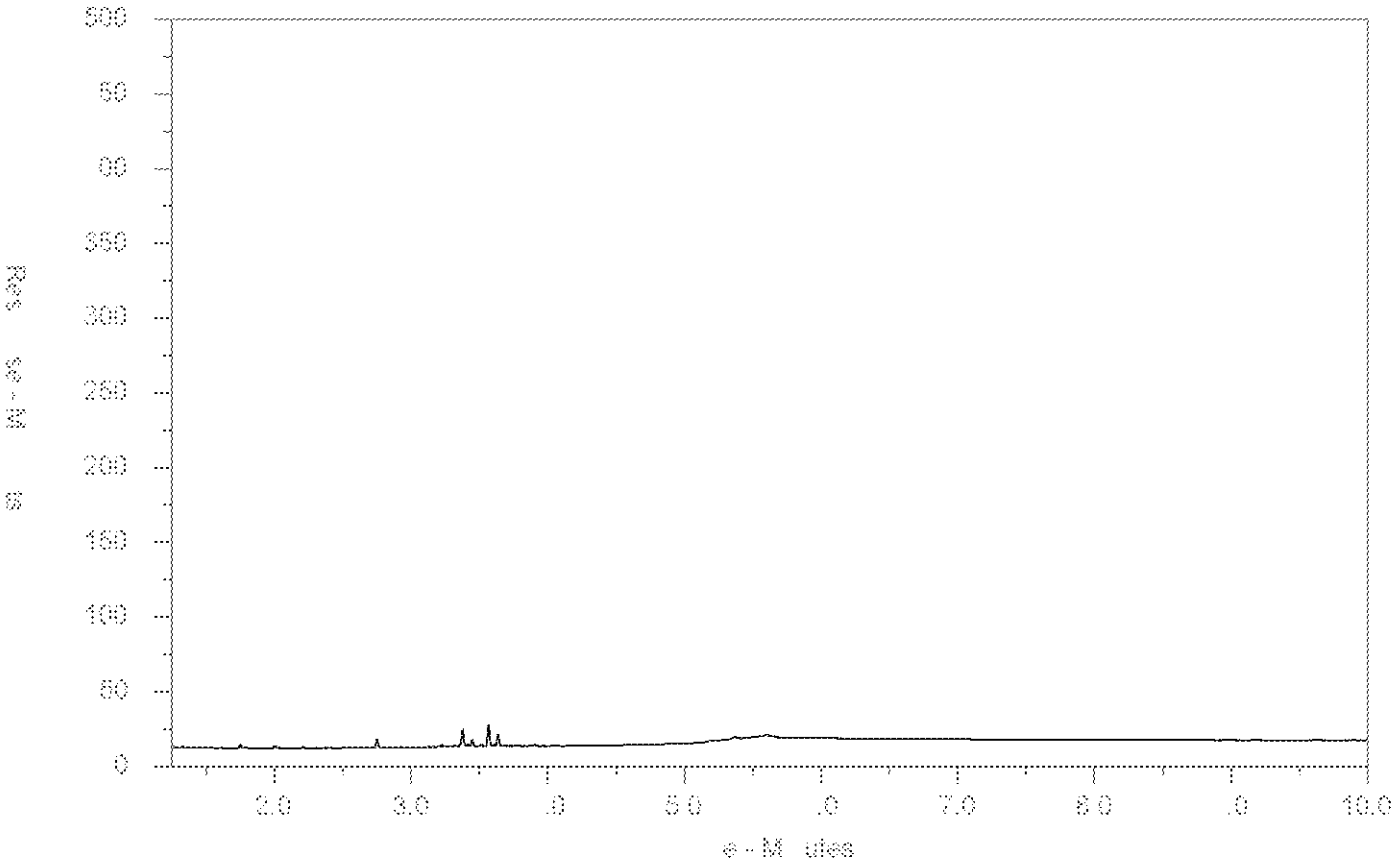
Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

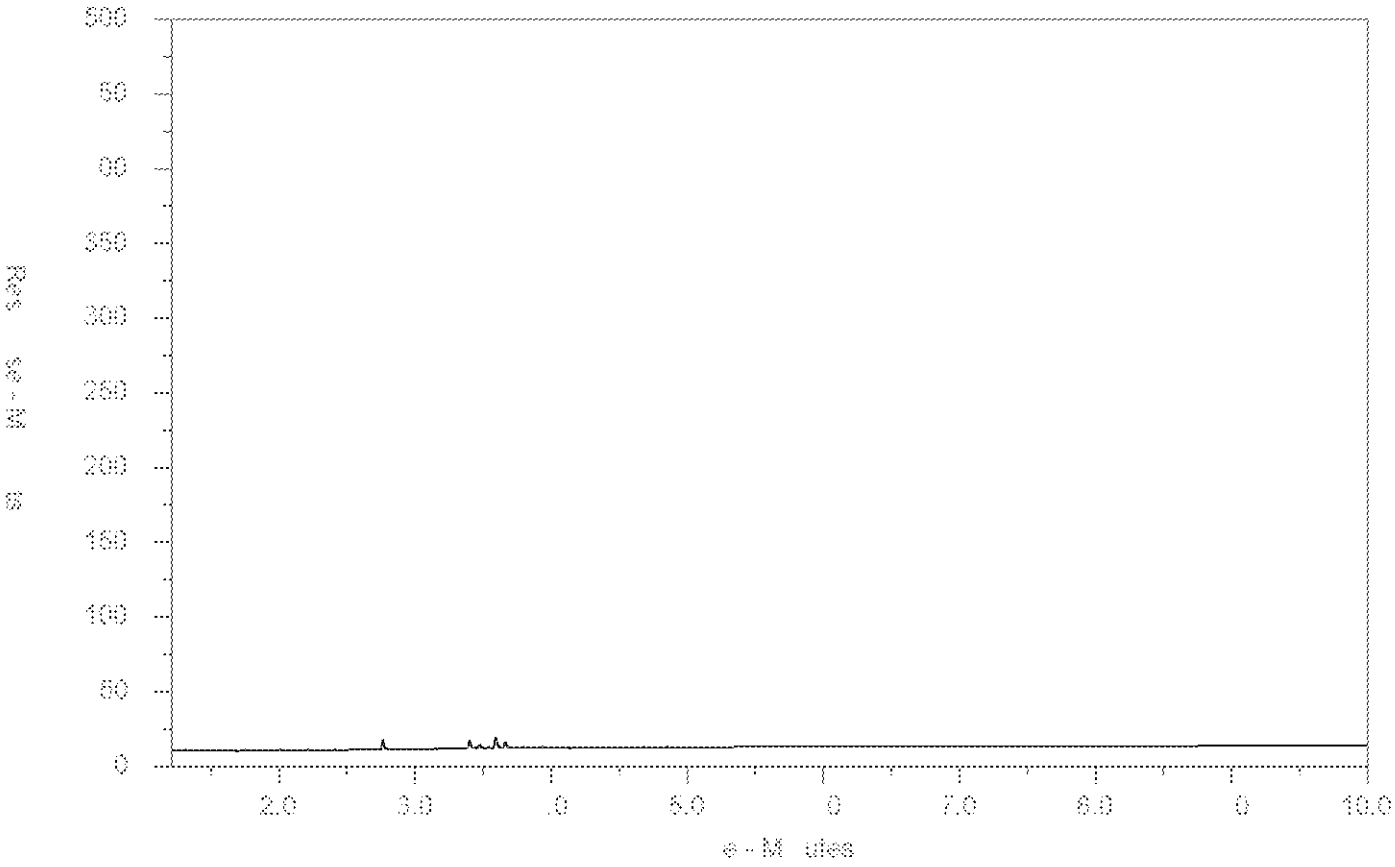
Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1857475-1
Client Sample ID: SW-45804-111416-TS-001

←F2→	←F3→	←F4→	
nC10	nC16	nC34	nC50
174°C	287°C	481°C	575°C
346°F	549°F	898°F	1067°F
Gasoline →	← Motor Oils/Lube Oils/Grease →		
← Diesel/Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

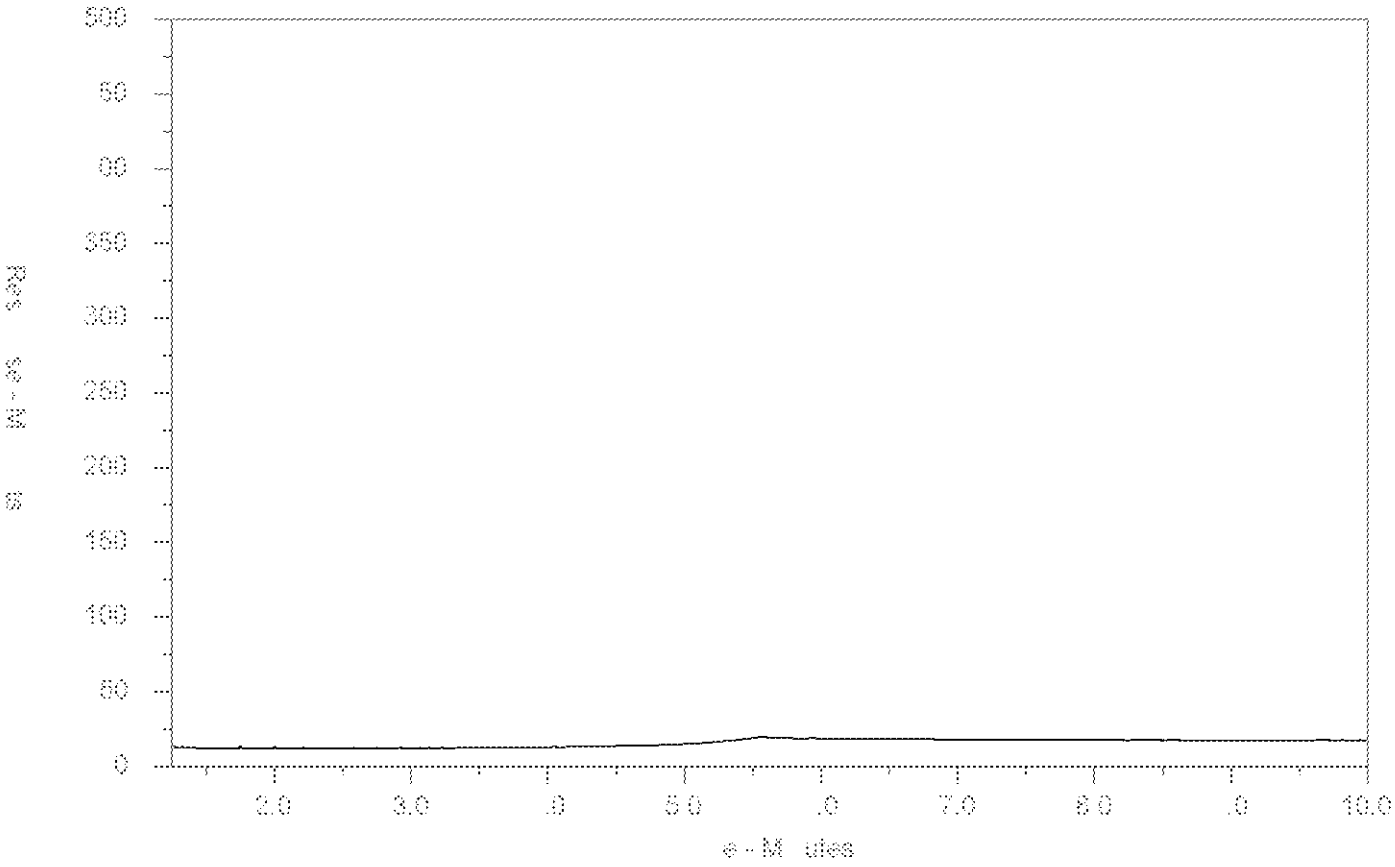
The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Boron (B)-Dissolved	MS-B	L1858227-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Copper (Cu)-Dissolved	MS-B	L1858227-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Iron (Fe)-Dissolved	MS-B	L1858227-1, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L1858227-1, -2, -3, -4, -5, -6, -7, -8

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-WT	Water	Alkalinity, Total (as CaCO3)	EPA 310.2
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT	Water	Dissolved Organic Carbon	APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

CL-IC-WT	Water	Chloride by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

COD-T-WT	Water	Chemical Oxygen Demand	APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-WT	Water	Colour	APHA 2120

Apparent Colour is measured spectrophotometrically by comparison to platinum-cobalt standards using the single wavelength method after sample decanting. Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MF-WT	Water	E. coli	SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h.
Method ID: WT-TM-1200

ETL-NH3-UNION-CLI-WT	Water	Un-ionized ammonia	CALCULATION
F1-F4-CALC-WT	Water	CCME Total Hydrocarbons	CCME CWS-PHC, Pub #1310, Dec 2001-L

Analytical methods used for analysis of CCME Petroleum Hydrocarbons have been validated and comply with the Reference Method for the CWS PHC.

In cases where results for both F4 and F4G are reported, the greater of the two results must be used in any application of the CWS PHC guidelines and the gravimetric heavy hydrocarbons cannot be added to the C6 to C50 hydrocarbons.
In samples where BTEX and F1 were analyzed , F1-BTEX represents a value where the sum of Benzene, Toluene, Ethylbenzene and total Xylenes has been subtracted from F1.

In samples where PAHs, F2 and F3 were analyzed, F2-Naphth represents the result where Naphthalene has been subtracted from F2. F3-PAH represents a result where the sum of Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Dibenzo(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Phenanthrene, and Pyrene has been subtracted from F3.

Unless otherwise qualified, the following quality control criteria have been met for the F1 hydrocarbon range:
1. All extraction and analysis holding times were met.
2. Instrument performance showing response factors for C6 and C10 within 30% of the response factor for toluene.
3. Linearity of gasoline response within 15% throughout the calibration range.

Unless otherwise qualified, the following quality control criteria have been met for the F2-F4 hydrocarbon ranges:
1. All extraction and analysis holding times were met.
2. Instrument performance showing C10, C16 and C34 response factors within 10% of their average.
3. Instrument performance showing the C50 response factor within 30% of the average of the C10, C16 and C34 response factors.

Reference Information

4. Linearity of diesel or motor oil response within 15% throughout the calibration range.

F1-HS-WT Water F1 (O.Reg.153/04) E3421/CCME (HS)
Fraction F1 is determined by analyzing by headspace-GC/FID.

F2-F4-WT Water F2-F4 (O.Reg.153/04) MOE DECPH-E3421/CCME TIER 1
The petroleum hydrocarbons are extracted from the aqueous samples using solvent partition. The final concentrated extract is analyzed by gas chromatography (GC) using flame ionization detection (FID) and a 100% polydimethylsiloxane column.

The F2 fraction is determined by integrating the area in the chromatogram from the apex of nC10 to the apex nC16 and quantitating using external calibration using a standard mix containing nC10, nC16 and nC34. Similarly, the F3 fraction extends from the apex of nC16 to the apex nC34 and the F4 fraction covers the area from the apex nC34 to the apex nC50. If the chromatogram does not return to the baseline by the time nC50 elutes, a gravimetric determination of the F4 is performed.

FC-MF-WT Water Fecal Coliforms SM 9222D
A 100mL volume of sample is filtered through a membrane, the membrane is placed on mFC agar and incubated at 24–2h@44.5–0.2 C. Method ID: WT-TM-1200

HG-D-CVAA-WT Water Dissolved Mercury in Water by CVAAS EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

MET-D-CCMS-WT Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)
Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT Water Ammonia, Total as N EPA 350.1
Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT Water Nitrite in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT Water Nitrate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-WT Water Total P in Water by Colour APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PAH-CCME-WT Water CCME PAHs SW846 8270
Sample is extracted at neutral pH using separate aliquots of dichloromethane with a modified separatory funnel technique, extracts are then concentrated and analyzed by GC/MSD. Depending on the analytical GC/MS column used benzo(j)fluoranthene may chromatographically co-elute with benzo(b)fluoranthene or benzo(k)fluoranthene.

PH,TEMP-CLIENT-WT Water pH & Temperature Results supplied by client

PH-WT Water pH APHA 4500 H-Electrode
Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT Water Phenol (4AAP) EPA 9066
An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-WT Water Sulfate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SOLIDS-TDS-WT Water Total Dissolved Solids APHA 2540C
A well-mixed sample is filtered though glass fibres filter. A known volume of the filtrate is evaporated and dried at 105–5 C overnight and then 180–10 C for 1hr.

Reference Information

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TC-MF-WT	Water	Total Coliforms	SM 9222B

A 100mL volume of sample is filtered through a membrane, the membrane is placed on mENDO LES agar and incubated at 35–0.5 C for 24–2h.
Method ID: WT-TM-1200

TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

TURBIDITY-WT	Water	Turbidity	APHA 2130 B

Sample result is based on a comparison of the intensity of the light scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension under the same conditions. Sample readings are obtained from a Nephelometer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L1858227 Report Date: 23-NOV-16

Client: GHD Limited (Waterloo)
179 Colonnade Road, Suite 400
Ottawa ON K2E 7J4
Contact: AIRESSE MACPHEE

Legend:

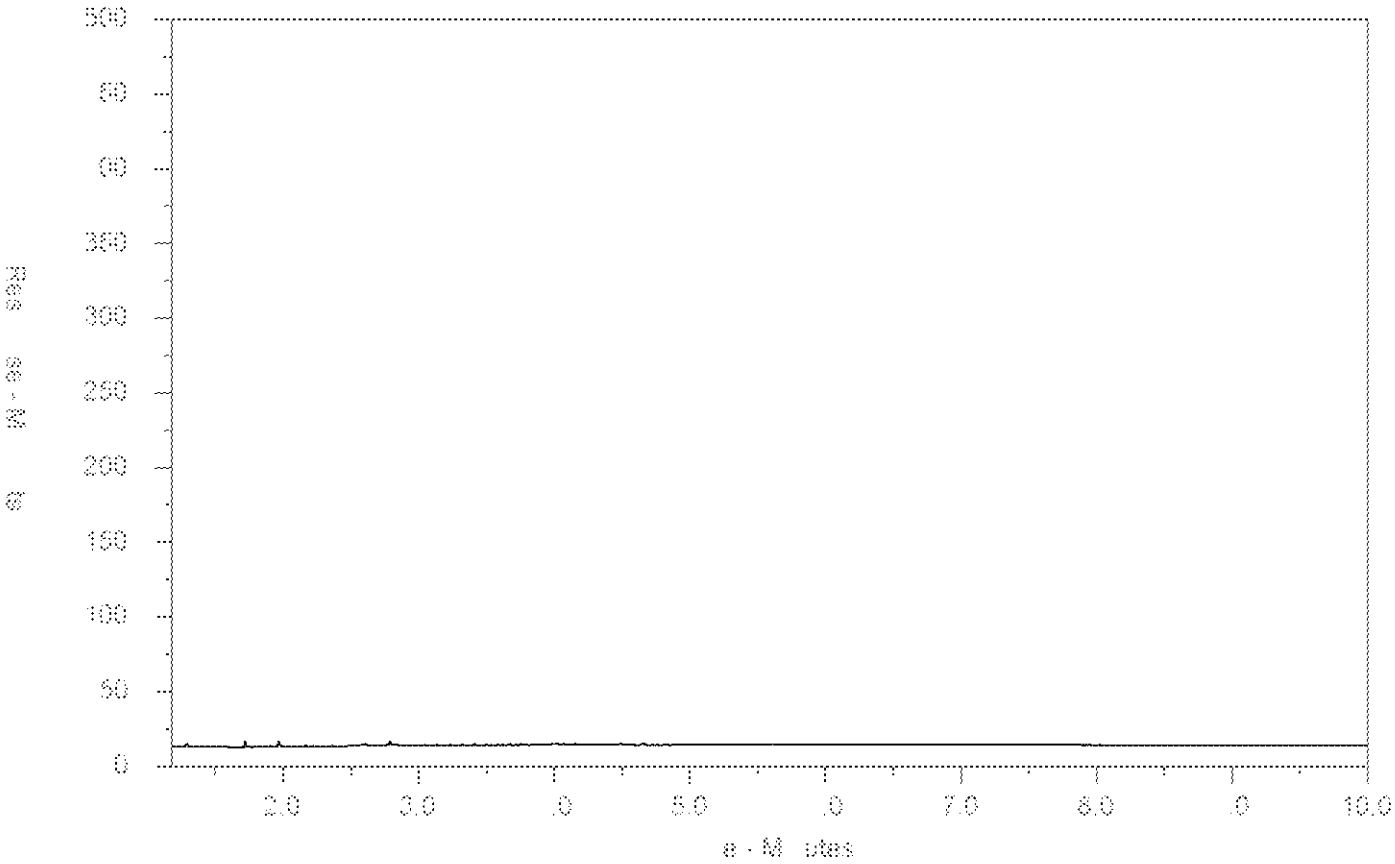
Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.



ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

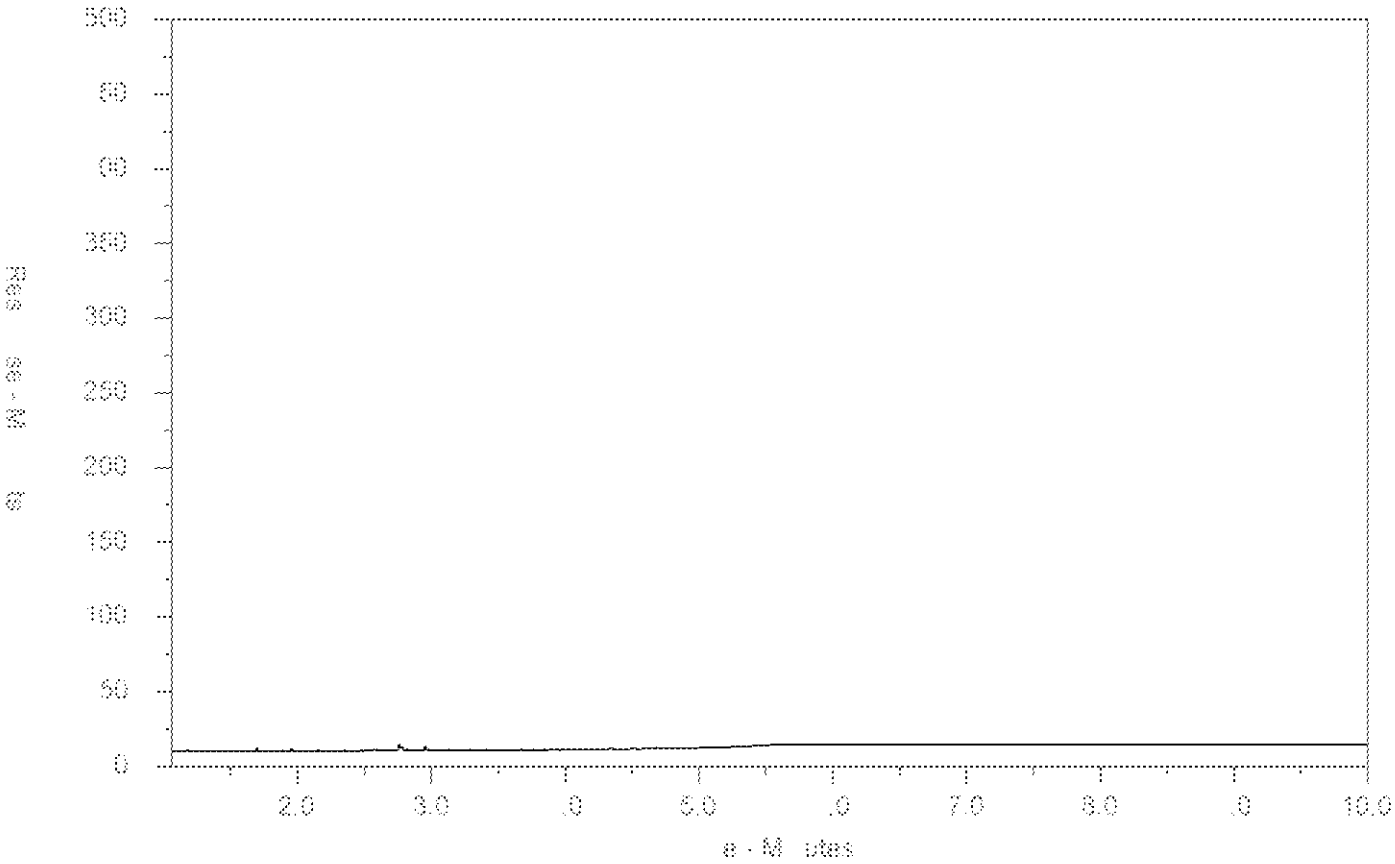
Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

CCME F2-F4 HYDROCARBON DISTRIBUTION REPORT

ALS Sample ID: L1858227-1
Client Sample ID: GW-45804-111516-TS-001

←F2→	←F3→	←F4→	
nC10	nC16	nC34	nC50
174°C	287°C	481°C	575°C
346°F	549°F	898°F	1067°F
Gasoline →		← Motor Oils/Lube Oils/Grease →	
← Diesel/Jet Fuels →			

The CCME F2-F4 Hydrocarbon Distribution Report (HDR) is intended to assist you in characterizing hydrocarbon products that may be present in your sample.



The scale at the bottom of the chromatogram indicates the approximate retention times of common petroleum products and four n-alkane hydrocarbon marker compounds. Retention times may vary between samples, but general patterns and distributions will remain similar.

Peak heights in this report are a function of the sample concentration, the sample amount extracted, the sample dilution factor and the scale at the left.

Note: This chromatogram was produced using GC conditions that are specific to ALS Canada CCME F2-F4 method. Refer to the ALS Canada CCME F2-F4 Hydrocarbon Library for a collection of chromatograms from common reference samples (fuels, oils, etc.). The HDR Library can be found at www.alsglobal.com.

Matrix Spike	Ammonia, Total (as N)	MS-B	L1811895-1
Matrix Spike	Phosphorus, Total	MS-B	L1811895-1
Matrix Spike	Nitrate (as N)	MS-B	L1811895-1

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
PEHR	Parameter Exceeded Recommended Holding Time On Receipt: Proceed With Analysis As Requested.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

BOD-WT	Water	BOD	APHA 5210 B

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT	Water	Dissolved Organic Carbon	APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

COD-T-WT	Water	Chemical Oxygen Demand	APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

EC-MF-WT	Water	E. coli	SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 °C for 24 – 2 h.
Method ID: WT-TM-1200

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

ETL-N2N3-WT	Water	Calculate from NO2 + NO3	APHA 4110 B
ETL-NH3-UNION-WT	Water	Un-ionized ammonia	CALCULATION
HG-T-CVAA-WT	Water	Total Mercury in Water by CVAAS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

MET-T-CCMS-WT	Water	Total Metals by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Reference Information

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT	Water	Ammonia, Total as N	EPA 350.1

Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

O2-DIS-WT	Water	Dissolved oxygen	APHA 4500-O

OGG-TOT-WT	Water	Oil and Grease, Total	APHA 5520 B

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT	Water	Phenol (4AAP)	EPA 9066

, automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 .C for a minimum of four hours or until a constant weight is achieved.

TEMP-CLIENT-WT	Water	Temperature	Result supplied by Client

TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.*

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
- The reporting limit.
- Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
Dissolved oxygen	1	10-AUG-16 09:00	11-AUG-16 14:00	0.25	29	hours	EHTR-FM

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1811895 were received on 10-AUG-16 13:30.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Boron (B)-Total	MS-B	L1851386-1
Matrix Spike	Ammonia, Total (as N)	MS-B	L1851386-1
Matrix Spike	Nitrate (as N)	MS-B	L1851386-1
Matrix Spike	Total Kjeldahl Nitrogen	MS-B	L1851386-1

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
PEHR	Parameter Exceeded Recommended Holding Time On Receipt: Proceed With Analysis As Requested.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

BOD-WT	Water	BOD	APHA 5210 B

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-ORG-WT	Water	Dissolved Organic Carbon	APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

COD-T-WT	Water	Chemical Oxygen Demand	APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

EC-MF-WT	Water	E. coli	SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 □C for 24 – 2 h.
Method ID: WT-TM-1200

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

ETL-N2N3-WT	Water	Calculate from NO2 + NO3	APHA 4110 B
ETL-NH3-UNION-WT	Water	Un-ionized ammonia	CALCULATION
HG-T-CVAA-WT	Water	Total Mercury in Water by CVAAS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

MET-T-CCMS-WT	Water	Total Metals by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

-WT	Water	Ammonia, Total as N	EPA 350.1

Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Reference Information

O2 DIS-WT	Water	Dissolved oxygen	APHA 4500-O
OGG-TOT-WT	Water	Oil and Grease, Total	APHA 5520 B

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PH-WT	Water	pH	MOEE E3137A-R511

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT	Water	Phenol (4AAP)	EPA 9066

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1□C for a minimum of four hours or until a constant weight is achieved.

TEMP-CLIENT-WT	Water	Temperature	Result supplied by Client
N-T-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.*

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
Dissolved oxygen	1	31-OCT-16 13:00	01-NOV-16 18:00	0.25	29	hours	EHTR-FM

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1851386 were received on 31-OCT-16 14:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

An ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Boron (B)-Total	MS-B	L1858237-1
Matrix Spike	Zinc (Zn)-Total	MS-B	L1858237-1
Matrix Spike	Ammonia, Total (as N)	MS-B	L1858237-1

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
PEHR	Parameter Exceeded Recommended Holding Time On Receipt: Proceed With Analysis As Requested.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

BOD-WT	Water	BOD	APHA 5210 B

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT	Water	Dissolved Organic Carbon	APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

COD-T-WT	Water	Chemical Oxygen Demand	APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

EC-MF-WT	Water	E. coli	SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 °C for 24 – 2 h.
Method ID: WT-TM-1200

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

ETL-N2N3-WT	Water	Calculate from NO2 + NO3	APHA 4110 B
ETL-NH3-UNION-WT	Water	Un-ionized ammonia	CALCULATION
HG-T-CVAA-WT	Water	Total Mercury in Water by CVAAS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

MET-T-CCMS-WT	Water	Total Metals by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT	Water	Ammonia, Total as N	EPA 350.1

Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

O2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

O2-DIS-WT	Water	Dissolved oxygen	APHA 4500-O

Reference Information

OGG-TOT-WT	Water	Oil and Grease, Total	APHA 5520 B

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT	Water	Phenol (4AAP)	EPA 9066

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1□C for a minimum of four hours or until a constant weight is achieved.

TEMP-CLIENT-WT	Water	Temperature	Result supplied by Client
TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

14-11201601

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
Dissolved oxygen							
	1	14-NOV-16 10:00	16-NOV-16 17:00	0.25	55	hours	EHTR-FM
Bacteriological Tests							
E. coli							
	1	14-NOV-16 10:00	16-NOV-16 16:45	48	55	hours	EHTL

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1858237 were received on 15-NOV-16 15:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the JS EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Nitrate (as N)	MS-B	L1824380-1
Matrix Spike	Phenols (4AAP)	MS-B	L1824380-1

Sample Parameter Qualifier key listed:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
PEHR	Parameter Exceeded Recommended Holding Time On Receipt: Proceed With Analysis As Requested.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
BOD-C-WT	Water	BOD Carbonaceous	APHA 5210 B (CBOD)

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

BOD-WT	Water	BOD	APHA 5210 B

This analysis is carried out using procedures adapted from APHA Method 5210B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

C-DIS-ORG-WT	Water	Dissolved Organic Carbon	APHA 5310 B-INSTRUMENTAL

Sample is filtered through a 0.45um filter, sample is then injected into a heated reaction chamber which is packed with an oxidative catalyst. The water is vaporized and the organic cabon is oxidized to carbon dioxide. The carbon dioxide is transported in a carrier gas and is measured by a non-dispersive infrared detector.

COD-T-WT	Water	Chemical Oxygen Demand	APHA 5220 D

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

EC-MF-WT	Water	E. coli	SM 9222D

A 100 mL volume of sample is filtered through a membrane, the membrane is placed on mFC-BCIG agar and incubated at 44.5 –0 .2 C for 24 – 2 h.
Method ID: WT-TM-1200

EC-WT	Water	Conductivity	APHA 2510 B

Water samples can be measured directly by immersing the conductivity cell into the sample.

ETL-N2N3-WT	Water	Calculate from NO2 + NO3	APHA 4110 B
ETL-NH3-UNION-WT	Water	Un-ionized ammonia	CALCULATION
HG-T-CVAA-WT	Water	Total Mercury in Water by CVAAS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

MET-T-CCMS-WT	Water	Total Metals by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

NH3-WT	Water	Ammonia, Total as N	EPA 350.1

Sample is measured colorimetrically. When sample is turbid a distillation step is required, sample is distilled into a solution of boric acid and measured colorimetrically.

NO2-IC-WT	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-WT	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

O2-DIS-WT	Water	Dissolved oxygen	APHA 4500-O

Reference Information

OGG-TOT-WT	Water	Oil and Grease, Total	APHA 5520 B

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is deteremined colourimetrically after persulphate digestion of the sample.

PH-WT	Water	pH	APHA 4500 H-Electrode

Water samples are analyzed directly by a calibrated pH meter.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

PHENOLS-4AAP-WT	Water	Phenol (4AAP)	EPA 9066

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric

A well-mixed sample is filtered through a weighed standard glass fibre filter and the residue retained is dried in an oven at 104–1 C for a minimum of four hours or until a constant weight is achieved.

TEMP-CLIENT-WT	Water	Temperature	Result supplied by Client
TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N

Sample is digested to convert the TKN to ammonium sulphate. The ammonia ions are heated to produce a colour complex. The absorbance measured by the instrument is proportional to the concentration of ammonium sulphate in the sample and is reported as TKN.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
Dissolved oxygen							
	1	06-SEP-16 12:45	07-SEP-16 16:00	0.25	27	hours	EHTR-FM

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1824380 were received on 06-SEP-16 13:40.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Unconfined Shallow Groundwater Analytical Results
2014 Groundwater and Surface Water Monitoring Report
Orgaworld Canada Ltd.
Ottawa, Ontario

Notes:

1) TLP - Trigger Level Program Concentration (CRA, 2015)
J - Estimated concentration.
ND - Non-detect at associated value.
U - Not present at or above the associated value.
R - Rejected.
- - Not analyzed.
▭ - Exceedence of the Tier I Trigger Level

Table E.4.3

Deep Bedrock Groundwater Analytical Results
2014 Groundwater and Surface Water Monitoring Report
Orgaworld Canada Ltd.
Ottawa, Ontario

Notes:

1) TLP - Trigger Level Program Concentration (CRA, 2015)
2) ODWQS - Ontario Drinking Water Quality Standards, Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines (MOECC, June 2003, revised June 2006)

J - Estimated concentration.
ND - Non-detect at associated value.
U - Not present at or above the associated value.
R - Rejected.
- - Not analyzed.
[ ] - Exceedence of the Tier I Trigger Level
[ ] - Exceedence of the ODWQS

2019 Groundwater and Surface Water Monitoring Report

Convertus Canada Ltd.
Organics Composting Facility
5123 Hawthorne Road
Ottawa, Ontario

Executive Summary

GHD was retained by Convertus Canada Ltd. (formerly Renewi Canada Ltd.) to conduct a Groundwater and Surface Water Monitoring Program (Monitoring Program) at the Convertus Source Separated Organics (SSO) Processing Facility (Facility) located at 5123 Hawthorne Road in Ottawa, Ontario (Site).

The 2019 Monitoring Program was completed in general accordance with the requirements of the Facility's *Industrial Sewage Works Environmental Compliance Approval (*No. 2844-9YNGZC) as amended on February 1, 2017.

The purpose of the Monitoring Program is, in accordance with the ECA, to assess the potential for Site activities to adversely affect the surrounding surface water and groundwater quality.

GHD completed three monitoring events at the Site in 2019: June, September, and November. Monitoring included groundwater elevation measurements, groundwater quality sampling, and surface water sampling. Based on the groundwater elevations gathered in June, September and November 2019, shallow unconfined aquifer flow occurs in an east-northeast direction and groundwater in the deep bedrock aquifer flows in a west-southwest direction, opposite to the direction of the shallow unconfined aquifer.

Analytical results for the shallow unconfined aquifer samples indicate that groundwater quality at the Site is being affected by Facility operations. The distribution of elevated concentrations of ammonia, DOC, iron, and manganese are consistent with the presence of an organic contaminant source.

Analytical sample results obtained from the deep bedrock aquifer unit monitoring wells indicate that groundwater quality in the deep bedrock aquifer is naturally poor. Increasing ammonia concentrations during previous monitoring periods had been observed downgradient of the Facility at TW-8, however recent results show decreases and stabilization in ammonia concentrations. Based on the expanded dataset of water quality from 2019, there is no evidence that Facility operations are having a significant affect on deep bedrock groundwater quality.

The 2019 groundwater quality results were assessed using the Site's Trigger Level Program. Within the shallow unconfined aquifer, ammonia was found at concentrations greater than those specified by the Site's trigger concentrations at several of the near Facility monitoring wells as well as some downgradient monitoring locations.

In the unconfined shallow aquifer, Tier I trigger level exceedances were noted at five monitoring locations in 2019. These locations included MW5-09, MW101-13, MW102-09, and MW105-13 (spring and fall) and MW104-13 (spring). During fall 2019, multiple trigger level parameters were exceeded at MW104-13 (ammonia and nitrate). Therefore, MW5-09, MW101-13, MW102-09, and MW105-13 will be sampled according to the Tier I sampling protocol and MW104-13 will be sampled according to the Tier II sampling protocol during the spring 2020 monitoring event.

In the deep bedrock aquifer, a single trigger level exceedance (ammonia) was noted at monitoring well TW-4 (spring). Multiple trigger level exceedances (ammonia and nitrate) were noted at TW-4 (fall) and TW-8 (spring and fall). Therefore, monitoring locations TW-4 and TW-8 will be sampled under Tier II protocols during the spring 2020 monitoring event.

Surface water sample results indicate that surface water quality downstream of the Site was unaltered by Site activities during the 2019 monitoring period.

Surface water was discharged once from the on-Site Stormwater Management Pond during the 2019 monitoring period (April). All parameters were below their respective trigger levels, listed in the Site ECA, in samples collected from the Stormwater Management Pond prior to discharging.

Substantial improvements were made to Site operations during a significant capital upgrade effort undertaken in 2019 totalling $8.5 million. The following points summarize the main improvements:

- The original ammonia scrubber was removed and replaced with three new ammonia scrubber units. Leakage from the old ammonia scrubber was suspected to be a contributing source to the elevated ammonia concentrations observed in shallow groundwater adjacent to the facility.
- The floors in the vicinity of the ammonia scrubber were bermed and sealed with a chemical-resistant epoxy coating to reduce the possibility of leakage from within the Facility to the subsurface via leaking through cracks in the floor.
- EW107-15 was plumbed directly into the Facility's process water supply system. EW107-15 is now used as the principal source of water supply for process-related demands, replacing the stormwater retention pond. This improvement allowed for a significant increase in the amount of groundwater extracted from EW107-15 during 2019, which is expected to continue in future years.
- The SCADA system controlling and logging the operation of EW107-15 was upgraded to improve tracking of groundwater extraction volumes.
- Changes to Facility operations have been implemented to ensure that the receiving, processing, storage, and shipping operations are completed in such a way that stockpiling of materials is significantly minimized. These operational changes have improved the Facility's throughput and significantly reduced on-Site storage times of both processed and unprocessed materials which would minimize leachate runoff.
- Significant improvements have been made in the management of leachate within the composting process. Higher volumes of leachate are now recycled within the composting tunnels, and less comingling occurs between leachate and duct condensate water reducing the volume of excess leachate requiring UST storage while awaiting off-site disposal.
- Two new composting tunnels were commissioned (Tunnels #8 & #9), two new storage tunnels were constructed (Tunnels #9 & #10) that could be outfitted as composting tunnels at a future date, a new biofilter was built (Biofilter #3) and a new ventilation system was installed throughout the processing areas to capture odour while minimizing fog during the winter months.

1. Introduction

GHD was retained by Convertus Canada Ltd. (formerly Renewi Canada Ltd.) to conduct a Groundwater and Surface Water Monitoring Program (Monitoring Program) at the Convertus Source Separated Organics (SSO) Processing Facility (Facility) located at 5123 Hawthorne Road in Ottawa, Ontario (Site).

A Site location map is provided on Figure 1.1.

The 2019 Monitoring Program was completed in general accordance with the requirements of the Facility's *Industrial Sewage Works Environmental Compliance Approval (*No. 2844-9YNGZC) as amended on February 1, 2017 (herein referred to as the ECA). A copy of the Facility's ECA is provided as Appendix A which is included on the USB stick at the end of this report. Please note that all Appendices are included on the USB stick.

The purpose of the Monitoring Program is, in accordance with the ECA, to assess the potential for Site activities to adversely affect the surrounding surface water and groundwater quality.

1.1 Site Background

The Site consists of an area of approximately 10-hectares that is located within an industrial development area. The area, known as the Hawthorne Industrial Park, occupies a surface area of approximately 80-hectares (referred to herein as the HIP subdivision) and has been developed by R.W. Tomlinson (Tomlinson) as an industrial business area. Convertus is a tenant of Tomlinson.

Between June and August 2008, GHD conducted Phase I and II Environmental Site Assessment (ESA) investigations for Tomlinson to determine the general suitability of the HIP subdivision lands for development as an industrial park. More specifically, the ESAs were completed to support a Site Plan Control Application for the lease and subsequent development and operation of the SSO Facility in the southwest portion of the HIP (CRA, 2008a). GHD submitted the ESAs to the City of Ottawa on behalf of Convertus.

Site clearing and preparation was completed in 2008, Facility was constructed during 2009, and initial receipt of materials for processing was in January of 2010.

The 2008 groundwater monitoring/sampling activities included sampling of ten shallow aquifer wells (MW1-08 to MW10-08) and three surface water locations (SW1 to SW3). In addition, Golder Associates Ltd. (Golder) conducted a pumping test and sampling of the deep groundwater wells in August 2008 (TW-2 and TW-3) and October 2008 (TW-4 to TW-6) (Golder, 2008).

In 2009, GHD was tasked by Convertus to generate the Monitoring Program, based on a request from the Ministry of Environment, Conservation & Parks (MECP) through the process of reviewing the ECA application. In March 2010, the Monitoring Program was modified through an ECA amendment to reflect Site conditions and monitoring well availability. Further modifications to the monitoring program were required in 2013, to reflect additional changes in the monitoring well network (replacement and addition of new monitoring wells).

Condition 9(8) of the former ECA (Industrial Sewage Works No. 7251-8GKRPD) states that:

> *"the Owner shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this Certificate to the Director and the District Manager."*

In order to satisfy this condition, GHD prepared a Compliance and Trigger Level Monitoring Program (TLP) in 2014/2015. The TLP was submitted to the MECP along with an application to amend the ECA in March 2015. The updated TLP uses a focused set of parameters and statistically based upper tolerance limits (UTLs) developed from historical data for the purpose of setting Site-specific trigger levels for the selected parameters. A complete discussion and assessment consistent with the TLP is included in Section 6. For reference, a copy of the memorandum sent to the MECP that outlines the updated TLP is included in Appendix B.1.

GHD prepared a Monitoring Program Rationalization (MPR) for the Site during 2015. The purpose of the MPR was to ensure that groundwater and surface water was being adequately monitored. This was accomplished through a review of the monitoring program and removal of any redundant or unnecessary monitoring. The principal recommendations of the MPR are as follows:

- Incorporate the proposed monitoring and extraction wells into the monitoring program upon installation
- Reduce monitoring from quarterly to three times per year
- Remove polycyclic aromatic hydrocarbon and petroleum hydrocarbon monitoring from the program

A copy of GHD's memorandum outlining the MPR is included in Appendix B.2.

On February 1, 2017, the MECP issued a revised ECA (No. 2844-9YNGZC) for the Facility. The revised ECA incorporates the updated TLP submitted to the MECP in March 2015.

The 2019 monitoring program was completed in accordance to the schedules in the revised ECA. A copy of the revised ECA is included in Appendix A.

This report presents an assessment of the groundwater and surface water quality at the Site and covers the period between January and December 2019.

1.2 Site Setting

The Site is located at the southwest corner of the HIP subdivision lands, located within the former Township of Gloucester (community of South Gloucester), which was amalgamated in January 2001 as part of the City of Ottawa. The HIP subdivision was developed by Tomlinson, and is located southeast of the Hawthorne Road and Rideau Road intersection, in the southeast area of the City of Ottawa.

The layout of the Site, commencing at the western portion of the Site off the Hawthorne Road entrance, consists of a large processing plant with a delivery/receiving area, administrative office, septic bed area, and emission stack. An asphalt skirt extends around three sides of the building, which slopes north, east, and south towards an on-Site perimeter ditch system. The on-Site

perimeter ditch system drains to the storm water management (SWM) pond located at the east side of the Site. The layout of the SWM and the drainage ditches are illustrated on Figure 1.2.

Surface water run-off from the Site generally drains to the on-Site perimeter ditch system which, in turn, drains to the on-Site SWM pond where it is impounded until it is manually released off-Site. Water that is released flows through local roadside ditches within the HIP subdivision, which discharge to a central stormwater dry pond for the HIP subdivision, and then to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River.

The central and southwestern portions of the Site are unfinished and consist of exposed bedrock, gravelly sands, levelled fill material, and a few shrubs and grass scrub.

Historically, since the early 1990's, the HIP Subdivision lands have been used for the placement of inert fill from construction and demolition projects and as a temporary storage area for precast concrete pipe and chambers. The fill placement on the HIP lands represented materials that were being progressively used for backfill/leveling operations throughout the Industrial Park. A ditch used to convey groundwater pumped from the Rideau Road Quarries (Quarry #1 and Quarry #2) and the Dibblee Quarry (all located west/southwest of the Site) has been observed along the western and northern boundaries of the HIP subdivision. This ditch eventually flows into the Findlay Creek Municipal Drain at the northeast corner of the HIP subdivision. Findlay Creek Municipal Drain is situated along the northeastern boundary of the HIP subdivision.

1.3 Site Processes

The Facility is an aerobic composting operation that is approved to receive and process organics including source separated organics (SSO), leaf & yard waste, food wastes, commercial waste (restaurant wastes, etc.) and certain organic sludges. Organics are processed into a Non-Agricultural Source Material (NASM) and into animal bedding for agriculturally-beneficial applications. The Facility is designed to receive and process organics, to manage the resulting products and emissions, and to manage environmental impacts that are a result of the processing operations.

Storm water run-off from the Site drains to the on-Site SWM pond in accordance with the Site's ECA. Convertus undertakes analysis and testing of the pond water in accordance with the Site's ECA. If analysis and testing show acceptable water quality, the excess stormwater can be discharged into the HIP roadside ditch network.

1.4 Site Improvements – 2019

Several substantial improvements were made to Site operations during a significant capital upgrade effort undertaken in 2019 totalling $8.5 million. A principal objective of these improvements was to continue to improve the Facility's environmental performance. Several of the improvements relate directly to the groundwater remediation system, as discussed below.

The following points summarize the main improvements implemented:

- The original ammonia scrubber was removed and replaced with three new ammonia scrubber units. Leakage from the old ammonia scrubber was suspected to be a contributing source to the elevated ammonia concentrations observed in shallow groundwater adjacent to the Facility.
- The floors in the vicinity of the ammonia scrubber were bermed and sealed with a chemical-resistant epoxy coating to reduce the possibility of leakage from within the Facility to the subsurface via leaking through cracks in the floor.
- EW107-15 was plumbed directly into the Facility's process water supply system. EW107-15 is now used in place of the stormwater management pond as the principal source of make-up water supply for process-related demands. Process water is used to spray on the compost tunnels, used in the ammonia scrubbers and bioscrubbers, used to humidify the biofilters, and is used as fire suppression water supply. This improvement allowed for a significant increase in the amount of groundwater extracted from EW107-15 during 2019, which is expected to continue in future years.
- The SCADA system controlling and logging the operation of EW107-15 was upgraded to improve tracking of groundwater extraction volumes.
- Changes to Facility operations have been implemented to ensure that the receiving, processing, storage and shipping operations are completed in such a way that stockpiling of materials is significantly minimized. These operational changes have improved the Facility's throughput and significantly reduced on-Site storage times of both processed and unprocessed materials which would minimize leachate runoff.
- Significant improvements have been made in the management of leachate within the composting process. Higher volumes of leachate are now recycled within the composting tunnels, and less comingling occurs between leachate and duct condensate water reducing the volume of excess leachate requiring UST storage while awaiting off-site disposal.
- Two new composting tunnels were commissioned (Tunnels #8 & #9), two new storage tunnels were constructed (Tunnels #9 & #10) that could be outfitted as composting tunnels at a future date, a new biofilter was built (Biofilter #3) and a new ventilation system was installed throughout the processing areas to capture odour while minimizing fog during the winter months.

Acting on a recommendation of the MECP Technical Services Branch, GHD and Convertus staff undertook an 8-hour pumping test at EW107-15 on July 30, 2019. The test was undertaken to better understand the zone of hydraulic influence of EW107-15. The test was conducted at a pumping rate of 34.5 litres per minute (LPM) with a total observed drawdown of approximately 0.06 m in EW107-15. No drawdown was observed at any contiguous monitoring wells during the test.

The results of this pumping test confirm that the transmissivity of the shallow flow zone is high in the vicinity of EW107-15 (approximately 1,015 m^2/day). In addition, the maximum capture width upgradient of the extraction well was calculated to be only 2.5 m (~8 feet).

Groundwater extraction at EW107-15 is considered an appropriate remedial strategy, despite the limited capture zone, because of the position of this well in the interpreted zone of most pronounced impact. Removal of impacted shallow groundwater at this location will result in significant contaminant mass reduction in the subsurface and over the long-term will augment existing natural

attenuation processes at further reducing concentrations downgradient of the interpreted source area.

1.5 MECP Correspondence to Date

The correspondence below documents selected communications between Convertus and the MECP with regards to the application, requested amendments, and subsequent issuance of the Site's current ECA (Industrial Sewage Works) No. 2844-9YNGZC (formerly covered under ECA No. 7251-8GKRPD):

- Application for Approval of Industrial Sewage Works, Storm Water Management Facility, Ottawa City, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; September 19, 2008) (CRA, 2008b).
- Proposed Groundwater/Surface Water Monitoring Program, Application for Approval of Industrial Sewage Works, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, City of Ottawa, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; June 25, 2009).
- Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MOE; September 16, 2009).
- Summary of Pre-Start-up Groundwater/Surface Water Monitoring Program, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, Ottawa, Ontario (CRA; February 5, 2010a).
- Amendment Application, Deep Groundwater Monitoring Well Relocations, Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2010b).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; September 7, 2010).
- Amendment Application, New Equipment Installation, Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (CRA; March 18, 2010c).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7251-8GKRPD, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; May 30, 2011).
- Letter RE: 2012 Groundwater/Surface Water Monitoring and Compliance Report, Orgaworld Organics Facility — SWM Pond, from Ministry of the Environment Ottawa District Office (MOE, September 13, 2013).
- Memorandum RE: Groundwater Assessment and Work Plan – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; July 16, 2014).
- Memorandum RE: Recommended Compliance and Trigger Level Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 3, 2015a).

- Memorandum RE: Proposed Monitoring Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 27, 2015b).
- Environmental Compliance Approval – Application for Amendment (ECA No. 7251-8GKRPO), Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2015d).
- Memorandum RE: Orgaworld Organics Facility 2015 Groundwater and Surface Water Monitoring Report, Trigger Level Program, 5123 Hawthorne Road, City of Ottawa- Hydrogeologic Assessment from Ministry of the Environment and Climate Change Water Resources Unit, Eastern Region (MECP, January 3, 2017a).
- Environmental Compliance Approval (Industrial Sewage Works) No. 2844-9YNGZC Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MECP, February 1 ,2017b).

2. Physical Setting

2.1 Site Geology

The Site-specific geology was determined through visual examination of the soil samples collected across the HIP subdivision lands during previous investigations and through examination of the stratigraphic logs.

A total of 19 monitoring wells and one extraction well have been completed in the shallow unconfined aquifer unit throughout the HIP subdivision, 16 of which have been completed within the limits of the Convertus Site.

Test wells (TW-1 to TW-6) were completed by Golder in 1993 and 2008. TW-1 through TW-6 extend into the deep bedrock aquifer unit which was identified as the Nepean bedrock formation (Golder Associates, 2008).

In May 2010, GHD oversaw the installation of two on-Site deep bedrock test wells (TW-7 and TW-8). The stratigraphic logs from GHD's monitoring wells confirmed the presence of sandstone but also identified limestone at TW-8.

Ontario Geologic Survey (OGS) mapping shows the Oxford Formation (Dolostone) covers much of the Site with the March and Nepean Formations (Dolostone/Sandstone formations) present in the Northern portions of the HIP (OGS, Map 1508A).

The geological unit intercepted at each well is summarized in the monitoring well construction details provided in Appendix C for the overburden and deep bedrock wells. Monitoring location details are provided in Table 2.1.

Examination of the stratigraphic logs prepared by GHD indicates that the geology is generally consistent across the HIP subdivision. Five main geologic units were identified across the area investigated; these units are:

- Heterogeneous fill
- Topsoil layer

- Alluvial sand and silts
- Glacial till
- Bedrock

The topography and geology observed throughout the region are remnants of glacial scour, and more recently, marine deposits with some removal by fluvial erosion. The Site is located on a former quarry and thus filling activities have been carried out since the early 1990's which have significantly altered the local topography.

For 15 years or so prior to Facility construction, portions of the HIP subdivision have reportedly received inert fill from construction and demolition projects throughout the Ottawa area. The fill material received at the HIP subdivision was historically used to level some of the ground surface; however, the southern and eastern areas have historically received very little amounts of fill.

The HIP subdivision is generally flat with the exception of the southwest corner, where there formerly existed a rock knoll, now a rock outcrop. The top of this rock outcrop is approximately 10 m higher than the surrounding grades of the HIP subdivision.

The geology and hydrogeology of the geological units identified are discussed below.

Fill

Results of borehole drilling and soil sampling investigations by GHD indicate that most of the HIP subdivision is overlain by fill material. The fill was found to be heterogeneous and generally consisted of a granular matrix (sand, silts, and gravel) with traces of construction waste (concrete, asphalt, wood, and brick), occasionally some clay, boulders, and dredged sediment. The fill material was generally observed to be in a compact and moist state.

Topsoil

The topsoil found was generally fine silty sand with organic material. It was dark brown to black in colour, and was generally loose and moist. Topsoil was found in most locations that were not used as roads. In several locations, the topsoil contained roots and wood debris.

Alluvial Sands and Silts

Underlying the fill and/or topsoil, alluvial sand and silt deposits were observed. Where encountered, these deposits were found to vary in density from loose to dense, and generally described as very moist to wet.

Glacial Till

A glacial till was encountered below the fill and/or alluvial sands and silts in the western half of the HIP subdivision. The glacial till encountered was predominately a silty sand matrix with some gravel, cobbles, and trace clay and boulders. The material was brown to grey in colour, was generally very moist to wet, and was in a compact to dense state. The glacial till was observed to be directly overlying the bedrock.

Bedrock

On a regional basis, the bedrock underlying the HIP subdivision consists predominantly of limestone, sandstone, and dolostone of the Nepean, March and Oxford Formations. Top of bedrock was observed at depths varying from surface outcrops to a depth of approximately 7.6 metres below ground surface (m bgs) at the location of MW6-08. Bedrock core extending from 1.1 to 2.6 m into the bedrock was collected from MW2-08 and MW4-08 to identify and characterize the bedrock. The bedrock at MW2-08 and MW4-08 was described as fractured grey limestone. The bedrock was generally found to be fractured in the upper meter, where core recovery ranged from 93 to 94 percent and Rock Quality Designation (RQD) ranged from 63 to 75 percent. At depths in excess of 1 m into the bedrock, at MW2-08, the bedrock was found to be more competent with a recovery of 100 percent and a RQD of 93 percent.

2.2 Site Hydrogeology

Based on the review of information, the geological sequence observed at the HIP subdivision can be grouped into the two main hydrogeological units:

- A shallow unconfined groundwater unit (referred to as shallow unconfined aquifer) within the permeable fill, alluvial sands and silts and shallow fractured bedrock.
- A deep confined bedrock unit (referred to as the deep bedrock aquifer).

The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA, 2008a). Additional groundwater information regarding groundwater flow direction and velocity within the unconfined shallow aquifer unit is discussed in Section 4.1.

As part of GHD's Phase II ESA in 2008 (CRA, 2008a), an assessment of the connectivity between the shallow unconfined aquifer unit and the underlying deep bedrock aquifer unit was conducted by performing pumping tests at TW-1 through TW-3 in the deep bedrock aquifer unit. During the pumping test, water levels gathered from the shallow unconfined aquifer unit indicated no corresponding drawdown between the shallow and deep wells. Water levels in the deep bedrock aquifer unit lowered from 1.2 to 3.7 m during the 6-hour period. Based on the data, it was concluded that the shallow unconfined aquifer unit and the deep bedrock aquifer units are not hydraulically connected.

2.3 Surface Water and Drainage Features

Surface water run-off from the HIP subdivision generally drains through local ditches to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River.

A series of ditches within the Site drains to the on-Site SWM pond. The flow of the water from the SWM pond is controlled by a valve that outlets to a ditch which runs along the HIP subdivision internal roadway (Somme Street), towards the east through a central SWM pond, eventually outletting to Findlay Creek.

Another ditch runs along Hawthorne Road, flowing towards and eventually along Rideau Road, connecting to Findlay Creek; this ditch does not connect to the Convertus Site at Hawthorne Road or to Somme Street.

2.4 Groundwater Use

Water well data reviewed by GHD shows that the shallow unconfined water table unit is not locally used as a potable water source (Golder, 2008) (deemed unsuitable due to proximity to ground surface, limited saturated thickness, and low yield). The water well records indicate that the deep bedrock aquifer test wells located in proximity of the HIP subdivision are all installed within the deep bedrock aquifer formation at depths generally at or in excess of 30 m bgs (Appendix C.2). Bottled water is brought in for consumption at the Site, while water from TW-4 supplies sinks, showers, toilets, and the dishwashing machine for the Facility. If necessary, TW-4 can also be used as an alternative refilling source for replenishing the fire suppression water holding tank.

3. Monitoring Program

In accordance with recommendations of the Groundwater/Surface Water Monitoring Program (CRA, 2009) and Amendment Application (CRA, 2010b), GHD has completed ongoing monitoring from 2009 to present.

The following monitoring activities were completed at the Site during the current monitoring period:

- June 2019 - Semi-annual sampling:
  - Sampling at four surface water locations (SW-1 to SW-4)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
  - Collection and analysis of QA/QC samples
- September 2019 - Tri-annual sampling:
  - Hydraulic monitoring and sampling at six shallow unconfined aquifer wells (MW5-09, MW101-13, MW102-09, MW104-13, MW105-13, and MW106-15) and one deep bedrock aquifer well (TW-4)
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
  - Collection and analysis of QA/QC samples
- November 2019 - Semi-annual sampling:
  - Sampling at four surface water locations (SW-1 to SW-4)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells

- Sampling and hydraulic monitoring at the extraction well, EW107-15
- Hydraulic monitoring of the staff gauges in the northern ditch
- Collection and analysis of QA/QC samples

3.1 Monitoring Network

Currently the groundwater monitoring network consists of the following monitoring wells:

- Shallow unconfined aquifer unit: 11 groundwater monitoring wells and one extraction well: MW01-08, MW2-08, MW3-08, MW4-09, MW5-09, MW101-13, MW102-09, MW103-09, MW104-13, MW105-13, MW106-15, and EW107-15.
- Deep bedrock aquifer unit: three monitoring wells: TW-4, TW-7, and TW-8.

Surface water quality is monitored through four surface water monitoring locations (SW-1 to SW-4). Surface water level monitoring in the northern ditch is monitored by the four staff gauges (SG-1 through SG-4).

Table 3.1 provides a summary of the 2019 monitoring program.

The groundwater and surface water monitoring locations within the HIP subdivision are provided on Figure 3.1. Figure 3.1 also shows the Site limits included in the Convertus lease and the boundary of the HIP subdivision.

Figure 3.2 shows the groundwater and surface water locations on the Convertus Property.

3.2 Monitoring Protocol

3.2.1 Groundwater Monitoring

The depth to groundwater was measured using an electronic water level meter with the top of the monitoring well riser pipe as the reference point, or to the top of the steel casing for all deep bedrock aquifer monitoring wells. Groundwater elevations were subsequently calculated for each monitoring well by subtracting the depth to water measurement from the reference point elevation.

Groundwater samples were collected by following GHD's field method guideline protocols, which are consistent with MECP requirements. All shallow aquifer monitoring wells and deep aquifer monitoring wells, except TW-8, were purged and sampled using low-flow sampling techniques with dedicated polyethylene tubing and a peristaltic pump. Wells were sampled following stabilized field readings.

Due to the greater depth to groundwater, deep bedrock aquifer unit monitoring well TW-8 was sampled using low-flow methods with dedicated polyethylene tubing and a bladder pump system.

During mid-2016, a dedicated sampling port was installed in the Facility to facilitate sampling from EW107-15. The sample is collected after the extraction well and sample port are purged for several minutes to ensure the sample port and associated lines are clear of stagnant water.

The samples collected for metals analysis were field filtered using disposable 0.45 µm in-line filters. All groundwater samples collected were submitted for analysis, under chain-of-custody protocol, to

the Ottawa depot of ALS Environmental (ALS), based in Waterloo. Analytical results are discussed in Section 4.

The analytical parameter list for groundwater is summarized in Table 3.1. Due to a change in field staff and a coordination oversight, the September 2019 groundwater samples were analyzed for the stormwater management pond parameter list. As a result, several parameters normally included in the groundwater parameter list were inadvertently excluded from this event. Actions have been undertaken to ensure this error will not be repeated.

The original laboratory analytical reports are provided in Appendix D.

3.2.2 Surface Water Monitoring

Surface water samples were collected at four locations (SW-1 to SW-4) following GHD's field method guidelines. Surface water samples were collected by gently immersing the sample bottles in the ditch or pond water, taking care not to disturb the underlying sediments. Readings for pH, conductivity, dissolved oxygen, oxidation reduction potential (ORP), turbidity, and temperature were recorded at the time of sample collection. All surface water samples were collected without field filtering and as such, represent total parameter concentrations. It should be noted that potential dissolution of particulates by the acid preservative in the metals sample bottles can artificially increase parameter concentrations in surface water samples. Acid preservation is a standard method for preserving water samples for metals analysis. All surface water samples collected were submitted to the laboratory for analysis under standard chain-of-custody protocol. The sample parameter list for surface water sampling is the same as the parameter list for groundwater (refer to Table 3.1).

Hydraulic level monitoring is completed at four staff gauges located throughout the roadside ditch adjacent to the Site along the south side of Somme Street. The depth to standing-surface water was visually observed to be nil/dry during all three of the staff gauge monitoring events in 2019.

3.3 Quality Assurance/Quality Control Program

A QA/QC program was undertaken as part of the Monitoring Program. This program involved the collection and analysis of field duplicate samples and the evaluation of standard laboratory quality control samples and procedures. The potential for contamination of samples through field and laboratory procedures is monitored through the analysis of field and laboratory blanks and duplicates samples.

The quality control parameters were found to be within acceptable ranges of standard laboratory practice. Several qualifications of the 2019 analytical data were made through the QA/QC assessment.

Details of the QA/QC Assessment for the current monitoring period are provided in Appendix D. The qualifications indicated in Appendix D do not significantly alter the interpretation of the data or affect the conclusions provided in this report.

4. Monitoring Results

The results of the Monitoring Program for the current monitoring period are presented in the following sections as follows:

- Section 4.1 - Groundwater Hydraulic Monitoring
- Section 4.2 - Water Quality Monitoring

To better facilitate discussion of the water quality, the sampling points for the Monitoring Program have been divided into the following areas: shallow unconfined aquifer unit, deep bedrock aquifer unit, and surface water. Each is discussed in an upgradient to downgradient or upstream to downstream fashion.

4.1 Groundwater Hydraulic Monitoring

Groundwater elevation data collected during the current monitoring period is presented in Table 4.1. Groundwater elevations measured during the June, September and November 2019 monitoring events are consistent with those observed historically at the Site, and were used to develop groundwater contour figures, as presented on Figures 4.1 to 4.4. Shallow unconfined aquifer and deep bedrock aquifer groundwater elevations and contours for the June 2019 monitoring event are presented on Figures 4.1 and 4.3, respectively, and shallow unconfined aquifer and deep bedrock aquifer groundwater levels and contours for the November 2019 monitoring event are presented on Figures 4.2 and 4.4, respectively.

The shallow aquifer water table was encountered at elevations varying from 90.43 to 98.37 metres above mean sea level (m AMSL) at MW103-09 and MW3-08 during the June monitoring event, 91.53 to 93.13 m AMSL at MW102-09 and MW105-13 during the September monitoring event and 90.37 to 98.39 m AMSL at MW103-09 and MW3-08 during the November event. During 2019, the depth below grade to the shallow aquifer water table generally varied from 0.2 to 2.0 m BGS. The groundwater elevations measured at MW1-08 were above the surveyed ground surface elevation by 0.16 metres and below the ground surface by 0.01 meters during the June and November 2019 events, respectively. This is due to the low ground surface elevation around the Stormwater Management Pond. Based on the groundwater elevations gathered in June and November 2019, flow occurs in an east-northeast direction in the shallow unconfined aquifer. This is consistent with previous monitoring years.

The horizontal hydraulic gradients for the shallow unconfined aquifer unit for the May and November 2019 monitoring events were estimated from groundwater contours presented on Figures 4.1 and 4.2 to be approximately 0.02 m/m across the Site. The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA 2008b). Assuming an effective porosity of 40 percent for the shallow

unconfined aquifer unit, an estimate of the groundwater flow velocity can be determined from the following equation:

$$v = \frac{Ki}{n}$$

Where:

v = groundwater flow velocity (L/T)

K = hydraulic conductivity (L/T)

i = horizontal hydraulic gradient (unitless)

n = effective porosity

Based on this equation, the local groundwater velocity is estimated to range from a few millimeters per year to a high of approximately 6.4 m per year in the fill deposits and shallow fractured bedrock. Note that the hydraulic conductivity was estimated prior to development of the Site and may not be reflective of the current conditions at the Site.

During the 2019 monitoring period, the deep bedrock aquifer unit groundwater levels ranged from a low of 83.18 m AMSL (TW-8) to high of 90.74 m AMSL (TW-7). The seasonal water level fluctuation ranged from 0.56 m (TW-8) to 1.35 m (TW-7). Based on the 2019 groundwater elevations, groundwater in the deep bedrock aquifer unit flows in a west-southwest direction, which is opposite to the flow direction of the shallow unconfined aquifer unit. It is likely that the presence of a quarry to the west and southwest of the Site has influenced the groundwater flow direction within the deep bedrock aquifer unit. This is consistent with previous interpretations of groundwater flow across the Site.

Based on groundwater contours generated for the Site, hydraulic gradients for the deep aquifer unit were calculated at 0.017 and 0.015 m/m for the June and November 2019 events, respectively.

Acting on a recommendation of the MECP Technical Services Branch, GHD and Convertus staff undertook an 8-hour pumping test at EW107-15 on July 30, 2019. The test was undertaken to better understand the zone of hydraulic influence of EW107-15. The test was conducted at a pumping rate of 34.5 litres per minute (LPM) with a total observed drawdown of approximately 0.06 m in EW107-15. No drawdown was observed at any contiguous monitoring wells during the test.

The results of this pumping test confirm that the transmissivity of the shallow flow zone is high in the vicinity of EW107-15 (approximately 1,015 m^2/day). In addition, the maximum capture width upgradient of the extraction well was calculated to be only 2.5 m (~8 feet).

Groundwater extraction at EW107-15 is considered an appropriate remedial strategy, despite the limited capture zone, because of the position of this well in the interpreted zone of most pronounced impact. Removal of impacted shallow groundwater at this location will result in significant contaminant mass reduction in the subsurface and over the long-term and will augment existing natural attenuation processes at further reducing concentrations downgradient of the interpreted source area.

4.2 Water Quality Monitoring

The following Sections provide a discussion regarding the spatial and temporal trends of selected indicator parameters at the Site.

4.2.1 Shallow Unconfined Aquifer Unit Groundwater Quality

Groundwater flow in the shallow unconfined aquifer occurs in an east-northeast direction, as illustrated on Figures 4.1 and 4.2. According to the position relative to the Facility, the groundwater monitoring wells can be grouped as:

- Upgradient wells: MW3-08 and MW4-09
- Upgradient/cross gradient wells: MW2-08
- Facility Area: EW107-15, MW101-13, and MW105-13
- Downgradient: MW1-08, MW5-09, MW102-09, MW103-09, MW104-13, and MW106-15

Tabulated analytical results for the shallow unconfined aquifer from the 2019 sampling program are provided in Table 4.2.

On behalf of Convertus, GHD completed a Groundwater Assessment and Work Plan in July 2014 (Groundwater Assessment, Appendix B.3). The Groundwater Assessment evaluated the 2013 and historical groundwater quality in order to determine appropriate parameters of concern for the Site. Previous evaluations of groundwater quality at the Site identified ammonia as the primary indicator parameter for Facility-related groundwater quality impacts at the Site. The Groundwater Assessment confirmed the presence of an ammonia plume within the shallow unconfined aquifer unit

The Groundwater Assessment also identified additional parameters of concern through a comparison of the 2013 water quality data to background water quality and the MECP criteria listed in the Ontario Drinking Water Standards (ODWS) (MOE, 2003, as amended). The comparison identified the following additional indicator parameters for identifying potential groundwater impacts from Facility operations: iron, manganese, dissolved organic carbon (DOC), sulfate, and total dissolved solids (TDS).

Ammonia and DOC are commonly used as indicators of groundwater quality impacts associated with the discharge of organic waste related contaminants to the subsurface. Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Figures 4.5 through 4.8 provide concentration isopleths (lines of inferred equal concentration) for ammonia, dissolved iron, dissolved manganese, and DOC. The 2019 median concentrations from the shallow unconfined aquifer unit monitoring wells have been used to create the isopleths. Concentration isopleth figures are useful for evaluating and presenting spatial patterns in groundwater chemistry.

On Figures 4.5 through 4.8, the presence of elevated concentrations of the indicator parameters are identified in close proximity to, or just downgradient from, the Facility. The elevated concentrations appear to extend from the Facility to the east-northeast following the direction of groundwater flow. Some decreases in concentrations are observed with increased distance from the Facility (following the path of groundwater flow in the shallow unconfined aquifer) for ammonia in particular and concentrations remain low to the west, south, and southeast of the Facility. Note that due to the highly variable concentrations of ammonia, iron and manganese at EW107-15 water quality from this location has not been included in the contouring presented on Figures 4.5, 4.6 and 4.7. Pumping at EW107-15 is suspected to contribute to the highly variable water quality observed at this location. Further discussion of the extraction well is provided in Section 5.

The pattern of iron and manganese concentrations presented on Figures 4.6 and 4.7 is different than that observed for ammonia and DOC in that the concentrations reported in close proximity to the Facility are lower than those reported at the downgradient Site boundary. Notwithstanding this difference, the pattern of elevated concentrations on Site is consistent with a source emanating from the Facility. The pattern is likely attributable to the complex behaviour of these parameters in the subsurface, but also to the effects of periodic groundwater extraction adjacent to the Facility.

This distribution of elevated concentrations of ammonia, DOC, and to a lesser extent iron, and manganese is consistent with an organics-related contaminant source.

Figures 4.9.1 to 4.9.12 present the evolution of groundwater chemistry at the wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

The following tables provide summaries of the trends and concentration ranges for ammonia in the shallow unconfined aquifer:

Location	Trend	Ammonia Concentration Range (mg/L)	
		Historic (pre-2019)	**2019**
MW4-09	↑	ND(0.050) – 0.554	ND(0.020) – 1.3
MW3-08	↑	ND(0.020) – 0.264	ND(0.020)
MW2-08	(2011-2018) Stable to ↑ and 2019 ↓	ND(0.020) – 0.171	ND(0.010) – ND(1.0)
EW107-15	↑ and ↓	0.123 – 88.0/91.1	31.4 – 83.8
MW105-13	↓	4.88 – 76.0	5.6 – 19.3
MW101-13	Stable	0.237 – 34.9	13.9/14.0 – 14.1
MW104-13	↑ and ↓	1.20 – 20.0	6.30/7.3 – 16.8
MW5-09	↓	0.32 – 31.4	12.8 – 14.4/16.1
MW102-09	↑	ND(0.050) – 15.2	9.61 – 11.6
MW1-08	↑	0.335 – 3.67	3.0 – 3.16
MW103-09	Stable	0.217/0.255 –2.35	0.95 – 1.7
MW106-15	Stable to ↑	1.91 – 18.6	1.68 – 3.3

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

As presented above, each of the upgradient locations (MW2-08, MW3-08 and MW4-09) have low ammonia levels. MW2-08 is located cross-gradient from the Facility and has shown little evidence of impacts. Ammonia concentrations at MW2-08 have shown some evidence of increases in recent monitoring, however concentrations remain relatively low. There is some evidence of recent increases in ammonia concentrations at upgradient monitoring wells during recent monitoring years. This pattern may suggest an upgradient off-Site source of ammonia contributing to the ammonia concentrations observed at these monitoring wells.

During the 2019 reporting year, overall trends in ammonia concentrations have been decreasing, particularly near the Facility. Ammonia concentrations at MW105-13 and MW101-13 had previously showed increasing trends. Current analytical data indicates declining and stable trends at each Facility area well. The analytical results for EW107-15 show highly variable concentrations during the period of operation of this extraction well. Active pumping at this location is suspected to be the principal source of the observed variability. Notwithstanding the fluctuations, the presence of elevated ammonia in the extraction well indicates that active groundwater extraction at this location is an appropriate remedial strategy.

Ammonia concentrations at MW5-09 followed a clear increasing trend between 2009 and mid-2015. Monitoring results from 2016 through 2019 demonstrate a more stable trend with ammonia concentrations ranging between 10 mg/L and 20 mg/L. Convertus's efforts to eliminate the source of subsurface discharge through the replacement of the existing ammonia scrubber with three new units in July 2019, along with the remediation of the zone of elevated ammonia adjacent to the Facility through operation of EW107-15, are likely responsible for the observed improvements in water quality at MW5-09 during this period.

Ammonia concentrations at downgradient locations MW102-09 and MW104-13 continue to demonstrate trends of increasing concentrations. The ammonia trends downgradient of the Facility are all increasing with the exception of MW103-09 and MW106-15 which continue to show fairly stable concentrations. MW5-09 and MW102-09 continue to exhibit elevated concentrations downgradient of the Facility.

The following table summarizes recent trends in iron and manganese concentrations within the unconfined shallow aquifer monitoring well network.

Location	Trend	Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)	
		Historic (pre-2019)	**2019**	**Historic (pre-2019)**	**2019**
MW4-09	↓	ND(0.010) – 1.86	ND(0.10) – 0.15	0.0556 – 1.25	0.0582 – 0.240
MW3-08	Stable	ND(0.010) – 1.04	ND(0.010)	ND(0.00050) – 0.0987	0.00074 – 0.0226
MW2-08	Stable	ND(0.010) – ND(0.10)	ND(0.010)	0.00058 – 0.207	0.00068 – 0.00566
EW107-15	Stable and ↓	0.022 – 2.56	ND(0.10) – 0.63	0.435/0.441 – 4.52/4.57	0.388 – 1.45
MW105-13	↑ and ↓	0.080/0.095 – 7.61	2.10 – 3.95	0.145 – 1.06	0.722 – 0.990
MW101-13	↓	ND(0.050) – 34.5	0.069/0.071 – 2.84/2.97	0.0114 – 2.24	0.671/0.685 – 1.36/1.42

Location	Trend	Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)	
MW104-13	↓	0.071 – 23.9	0.051/0.052 – 9.96/10.6	0.548 -19.4	1.95/1.98 – 5.33/5.46
MW5-09	Stable to ↓	1.99 – 14.5	3.22– 5.01/5.05	1.09 – 5.33	1.45 – 1.85/1.86
MW102-09	↓ and Stable	ND(0.010) – 24.0/24.7	2.41 – 4.53	ND(0.00050) – 5.16	1.69 – 2.39
MW1-08	↓	0.897 – 16.6/17.2	0.260 – 2.00	0.539 – 10.9/11.0	0.453 – 0.729

MW106-15	Stable to ↓	0.838 – 6.05	1.08 – 4.03	1.06 – 2.62	1.07 – 1.63

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

Elevated concentrations of dissolved iron and manganese are apparent in the Facility area and downgradient of the Facility, with the most elevated concentrations being reported at MW105-13, MW104-13, MW5-09, MW102-09, MW106-15, and MW1-08. As discussed above, iron and manganese concentrations in the interpreted source area immediately adjacent to the Facility have been lower than at downgradient locations during recent monitoring years.

The principal observation with respect to trends in iron and manganese concentrations within shallow groundwater at the Site is that concentrations have generally followed trends of decreasing levels over time. The principal exception to this pattern is at MW105-13. It is expected that these concentrations will continue to stabilize and decrease with time through natural attenuation and in response to Convertus's efforts to control releases to the subsurface and continue to remove impacted groundwater at EW107-15.

The following table summarizes recent trends in DOC concentrations within the unconfined shallow aquifer monitoring well network.

Location	Trend	DOC Concentration Range (mg/L)	
		Historic (pre-2019)	**2019**
MW4-09	Stable to ↓	1.0 – 3.5	1.97 – 2.46
MW3-08	Stable	1.5 – 3.5/9.0	2.35 – 3.04
MW2-08	↑	1.5 – 10.0	5.28 – 9.21
EW107-15	Stable to ↑	3.2 – 965/1,030	7.88 – 34
MW105-13	Stable to ↑	2.6 – 16.0	3.02 – 6.75
MW101-13	Stable	3.6 – 14.8	5.62 – 6.76/7.29
MW104-13	↓	5.5 – 51.2	7.70/8.19 – 9.23
MW5-09	Stable	5.4 – 13.0	6.33/6.74 – 8.53
MW102-09	Stable to ↓	ND(1.0) – 18.5	9.47 – 10.7
MW1-08	Stable	6.2 – 10.7	8.07 – 9.55

Location	Trend	DOC Concentration Range (mg/L)	
MW103-09	Stable	3.0/8.9 – 17.9	8.60 – 11.6
MW106-15	Stable	8.0 – 13.0	10.2 – 12.0

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

The current levels of DOC have remained consistent with some minor decreasing trends at MW104-13 and MW102-09. Concentrations of DOC are relatively low in the upgradient monitoring wells. Monitoring wells located downgradient of the Facility had previously demonstrated trends of elevated and increasing levels of DOC. Over the past monitoring year many of the concentrations have demonstrated decreasing or stable trends. Water quality at EW107-15 is highly variable, likely due to intermittent pumping at this location.

In general, the limited increases in DOC concentrations downgradient of the Facility relative to upgradient concentrations are minor compared to those observed for ammonia, iron or manganese.

Shallow Groundwater to Surface Water Discharge

In comments provided by the MECP on the 2012 annual report, the MECP requested that a comparison of shallow groundwater quality at MW103-09 to PWQOs be completed as part of future annual monitoring reports. Table 4.2A provides the 2019 analytical data for MW103-09 along with the PWQOs for comparative reference, with exceedances highlighted.

As indicated in Table 4.2A, several parameters exceeded their respective PWQOs at MW103-09 during the current monitoring period. The following provides a summary of those few exceedances:

- Iron – 2 of 2 samples
- Phosphorus – 2 of 2 samples

The Groundwater Assessment included recommendations to further investigate the relationship between shallow groundwater and surface water. Recommendations included that staff gauges be installed at four points within the northern ditch system and that a topographic survey of the northern portion of the Site, including the ditch, be undertaken.

Topographic surveying of the northern ditch system (including the ditch which drains into the SWM Pond and the ditch that continues towards Findlay Creek – the HIP Ditch) was completed and the four staff gauges were installed in early 2015. The Site's northern ditch was dry at each of the staff gauge locations during each monitoring event in 2019, which provides evidence that a significant volume of groundwater is not likely continuously discharging to the creek. A similar observation of the lack of sustained flow in the ditch has been made during every sampling event since 2015.

Figure 4.10 presents the results of the topographic surveying of the northern ditch overlain by the June 2019 groundwater contours. The topographic contours are provided in 0.5 m intervals with the lowest elevation presented representing the bottom of the ditch.

As shown in Figure 4.10, the topography of the ditches is 'w' shaped. The two ditch valleys or troughs travel parallel to the northern Site boundary with the on-Site ditch (that drains to the SWM

Pond) found south of the HIP ditch. The inferred groundwater elevations from June 2019 coincide closely with the bottom elevation of the ditches, and are above the bottom of the northern (roadside) ditch in several locations. These locations are illustrated on Figure 4.10 and are interpreted to be areas where shallow groundwater is discharging to the northern ditch. It should be noted that cattails and other hydrophilic vegetation are present in portions of this ditch providing further evidence support to the interpretation that some groundwater is discharging to the ditch.

Figure 4.10 further shows that a substantial portion of the ditch bottom is lower than groundwater elevations where the ditch is intersected by the extrapolated contours. Therefore, groundwater is likely discharging to the north ditch, particularly during periods of high groundwater levels (typically during the spring).

However, as noted above each of the staff gauge locations did not contain sufficient standing, or flowing, water for sampling during the 2019 monitoring events (or during any previous monitoring events). Based on the information available, the volume of groundwater seeping into the ditch is too low to maintain a consistent base flow. It is likely that groundwater seepage into the ditch is largely lost to evapotranspiration.

In conclusion, small volumes of groundwater are likely seeping to the north roadside ditch but the volumes are insufficient to form a base flow. Based on current available information, groundwater discharging to the ditch is unlikely to cause any adverse impacts to the surface water bodies in the vicinity of the Site.

4.2.2 Deep Bedrock Aquifer Groundwater Quality

Based on the available data for the deep bedrock aquifer, groundwater flow in the deep bedrock aquifer occurs to the southwest across the Site, as illustrated on Figures 4.3 and 4.4. According to their position relative to the Facility, the deep bedrock groundwater monitoring wells can be grouped as:

- Upgradient well: TW-7
- Downgradient wells: TW-4, TW-8

The discussion regarding the evolution of the selected parameters will be applied in the same way as for the shallow unconfined aquifer.

Tabulated analytical results for the deep bedrock aquifer from the 2019 sampling program are provided in Table 4.3 along with a comparison of the deep bedrock water quality to the Ontario Drinking Water Quality Standards (ODWQS) (Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, MOE, June 2003, revised June 2006 and July 2017).

Table 4.3 shows that several parameters have frequently been reported above their respective ODWQS in samples collected from each of the deep bedrock wells (TW-4, TW-7, and TW-8). The following provides a summary of the parameters reported above their ODWQS limits at least once in 2019:

Location	ODWQS Exceedances		
	June 2019	September 2019	November 2019
TW-7 (upgradient)	Manganese, pH (field)	-	pH (lab), turbidity (lab), turbidity (field)
TW-4 (downgradient)	Manganese, alkalinity, dissolved organic carbon, temperature (field), turbidity (field)	Iron, manganese, temperature (field)	Iron, manganese, alkalinity, dissolved organic carbon, turbidity (lab), turbidity (field)
TW-8 (downgradient)	Temperature (field), turbidity (field)	-	Iron, manganese, turbidity (lab), turbidity (field)

ODWQS Operational Guidelines, as well as the criteria for temperature and turbidity, do not relate directly to water samples collected from monitoring wells. The criteria for each are included in the ODWQS as they related to the effectiveness of water treatment and are thus not relevant to samples collected from groundwater monitoring wells. Alkalinity and pH concentrations should be given consideration in the evaluation of water quality; however, the ODWQS established for these parameters are Operational Guidelines set for water treatment plant operations and thus these Guidelines are not relevant to evaluations of water quality samples from groundwater monitoring wells.

Table 4.3 shows that water quality within the deep bedrock aquifer was poor in 2019. This is consistent with historical water quality within the deep bedrock aquifer, including water quality in samples collected from prior to construction of the Facility (see Appendix E). Based on the upgradient water quality from TW-7 and the surrounding land uses there are several potential upgradient sources of water quality impairments within this aquifer.

Water quality results from both downgradient wells had previously demonstrated some evidence of increases in ammonia concentrations. In particular, ammonia concentrations increased between 2009 and 2014 at TW-4 and TW-8. Monitoring data post 2014 has shown a reversal of this trend, with the exception of a single anomalous detection of ammonia above 10 mg/L at TW-4 in 2018. The timing of increases followed by decreases in ammonia concentrations suggests the Facility is not the source of this pattern in water quality.

Figures 4.11.1 to 4.11.3 present the evolution of groundwater chemistry at the deep bedrock wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

		Ammonia Concentration Range (mg/L)		DOC Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2019)**	**2019**	**Trend**	**Historic (pre-2019)**	**2019**
TW-7	Stable to ↑	ND(0.05) – 0.825	ND(1.0) – 0.019	↓	2.1 -15.1	3.02 – 4.37
TW-4	Stable	0.218 – 13.0	0.740/0.742 – 2.1	stable	4.4 – 10.4	6.39 – 7.49/8.26
TW-8	↓ to Stable	ND(0.050) – 4.60	0.479 – 1.7	↓	1.9 – 13.5	2.77 – 3.81

		Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2019)**	**2019**	**Trend**	**Historic (pre-2019)**	**2019**
TW-7	↓	ND(0.010) – 11.1	ND(0.010) – 0.222	↓	0.0352 – 1.71	0.0322 – 0.161
TW-4	↓	ND(0.050) – 3.30	0.11 – 0.44/0.64	Stable	0.496 – 1.94	0.969/0.976 – 1.17
TW-8	↓	ND(0.050) – 6.25	0.011 – 1.56	↓	0.00640 – 2.95	0.00252 – 0.556

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

It is important to note that the concentrations of iron, manganese and DOC at all on-Site deep bedrock locations remain relatively stable or have demonstrated trends of clear decreases. Considering shallow groundwater quality in the zone of most pronounced impact, it is unlikely that the Facility is a source of impact to the deep bedrock aquifer, given the temporal patterns observed in this aquifer.

A pumping test completed in 2008 showed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. The overall pattern of groundwater quality within the deep bedrock aquifer suggests that water quality is naturally poor. Notwithstanding the above, it is recommended that monitoring results for downgradient deep bedrock aquifer monitoring wells continue to be reviewed and assessed for potential Facility-related water quality impacts. If trends of deteriorating water quality are consistent, consideration should be given to undertaking further investigation or evaluating the need for a remedial strategy. Based on the monitoring results from the 2019 monitoring period, no additional investigation or remedial activities are necessary at this time, however indicator parameter concentrations at TW-4 should be closely monitored during future monitoring events.

4.2.3 Surface Water Quality

Analytical results for surface water samples collected from the storm water management pond (SW-4) and local ditch monitoring locations (SW-1 through SW-3) are presented in Table 4.4 and compared to the Provincial Water Quality Objectives (PWQO). The following table summarizes the surface water monitoring parameters that did not meet the PWQO during the 2019 sampling events.

Location	Parameter	PWQO (mg/L)	Spring (mg/L)	Fall (mg/L)
SW-1	Iron	0.3	0.324	0.368
SW-1	Phosphorus	0.01	0.0171	0.0625
SW-1	Escherichia Coli	100*	(52*)	280*
SW-2	Iron	0.3	0.576	1.22
SW-2	Phosphorus	0.01	0.0332	0.0620
SW-2	Escherichia Coli	100*	(68*)	450*

Location	Parameter	PWQO (mg/L)	Spring (mg/L)	Fall (mg/L)
SW-2	pH (field)	6.5-8.5	(7.61)	6.24
SW-3	Iron	0.3	0.481	1.13/1.19
SW-3	Phosphorus	0.01	0.0225	0.0503/0.0523
SW-3	Escherichia Coli	100*	170*	400/460*
SW-4	Phosphorus	0.01	0.177/0.210	0.110
SW-4	Phenolics	0.001	-	0.0094
SW-4	Escherichia Coli	100*	(4/16*)	900*

Notes:
*- Escherichia Coli concentrations are in colony forming units per 100 mL (CFU/100 mL)
** - temperature and species dependent
(7.16) – Brackets indicate value does not exceed PWQO

In general, water quality at the downstream surface water monitoring location (SW-3) is similar to upstream surface water monitoring location (SW-2), which indicates that contributions to surface water flow from the Convertus Facility are not impacting downstream water quality.

Concentrations of phosphorus were consistently above the PWQO at each of the monitoring locations. In addition, elevated iron concentrations were noted at SW-1, SW-2 and SW-3. E. coli levels were in exceedance of the PWQO for all fall 2019 samples.

Previous assessments of the Site concluded that concentrations of ammonia were showing increases at SW-4. Temporal concentration versus time plots for ammonia, DOC, manganese, and iron levels at SW-4 are presented on Figure 4.12. Figure 4.12 shows that ammonia concentrations are variable with elevated concentrations reported during late 2014, 2016 and late 2017 to late 2019. An overall trend of increases in ammonia concentrations within SW-4 between 2011 and 2019, as illustrated on Figure 4.12.

A total of 12 additional samples were collected by Convertus staff at surface water monitoring location SW-4 during the 2019 monitoring period. The analytical results for these samples have been included in Table 4.5.

Water was discharged from the stormwater management pond once during the 2019 monitoring period in April. The surface water quality results were compared to the trigger level parameters presented in the ECA prior to discharges to determine that the concentrations of trigger parameters were below the discharge criteria. All analytical results for samples collected prior to discharge were below their respective trigger levels. On this basis, all stormwater management pond discharge events were in compliance with the ECA trigger levels (outlined in Table 2 of the ECA) during 2019.

The stormwater management pond has had a total of six aerators installed to improve the water quality by agitating and oxygenating the ponded water. The first aerator was installed on July 10, 2018 and an additional five were installed on November 28, 2018. The 2019 sample results provide evidence that the aerators are reducing ammonia concentrations within the pond.

Based on the results of the surface water monitoring, there were no measurable effects on downstream surface water quality from the discharges during the 2019 monitoring period.

5. Shallow Groundwater Extraction System

Beginning on October 4, 2016, pumping from shallow groundwater extraction well EW107-15 commenced. The total volume pumped from extraction well EW107-15 during 2019 was 492,460 L. The 2019 pumping data is summarized in Table 5.1.

As previously mentioned, EW107-15 was sampled three times during the current reporting period with all three samples collected via the dedicated sampling port. The following table provides a summary of the 2019 indicator parameters:

Parameter (mg/L)	June 13, 2019	September 4/5, 2019	November 28, 2019
Ammonia-N	83.8	NA	31.4
Iron (dissolved)	ND(0.10)	ND(0.10)	0.63
Manganese (dissolved)	0.388	0.424	1.45
DOC	34	NA	7.88

Note:
/ - indicates duplicate analytical results

As indicated previously, the September 2019 groundwater samples were analyzed for the incorrect parameter list. Accordingly, several parameters are not available for this sample. There has been a high degree of variability in the concentrations reported in samples collected from this extraction well since installation. Groundwater quality at the Site is seasonally variable because of the effects of precipitation and runoff on shallow recharge, and periodic extraction of groundwater, as shown in Table 5.1, also likely contributes to the variability in the results. The June sample was collected during a period of infrequent pumping and the November sample was collected during a period of more regular pumping. The extraction well is primarily used during periods of water deficit when the amount of moisture contained in the incoming SSO is insufficient to maintain the various composting and process humidification purposes. This water deficit situation typically exists from late Spring to late Fall. In the colder winter months, the Facility is in a water surplus situation due to condensation and less evaporation.

Water quality results for the 2016 through 2019 monitoring periods suggest some improvement in water quality in the vicinity of EW107-15 and downgradient. This improvement is likely related to Facility improvements made to control the source of discharge and active groundwater extraction within the interpreted historical source area. It is expected that continued/improved operation of the shallow groundwater extraction well will, over time, remove the most impacted groundwater from the Facility area. This will result in improved water quality in both the Facility area and downgradient which should, in turn, reduce the occurrence of Tier I trigger exceedances.

As discussed previously, Convertus made changes to the configuration of their process water system during 2019. These changes allow for an increase in the amount of groundwater extracted from EW107-15. It is likely that the higher and more consistent extraction rates at this well will result in observable improvements in groundwater quality in the zone of most pronounced impact (near the Facility) and downgradient over the long-term.

In order to provide for a more detailed understanding of the effects of increased pumping at EW107-15 it is recommended that EW107-15 be sampled monthly for 2 years.

6. Compliance and Trigger Level Program

Condition 9(3b) of the amended ECA (2011) requires the development of trigger level criteria in accordance with MECP Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). In a memorandum to the MECP, dated February 27, 2015, GHD provided an outline for a recommended Compliance and Trigger Level Program (TLP). A copy of the memo is included in Appendix B1. The memo provides a detailed history of developing the TLP as well as the three-tiered approach to evaluating compliance at the Site.

The following Sections provide a brief summary of the key points of the TLP and an assessment of the current water quality.

6.1 Trigger Parameters

A focused set of parameters which are related to the sources of potential impacts from on-Site activities were selected for the purposes of the TLP. The TLP parameter list includes the following trigger parameters: ammonia, phosphorus, DOC, nitrate, iron, manganese, alkalinity, and E. Coli. Ammonia, phosphorus, DOC, nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic sources due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

6.2 Trigger Concentrations

The following table provides the trigger levels for the above-referenced trigger parameters.

The trigger levels for the shallow unconfined aquifer are based on the 95 percent upper-tolerance limits (UTLs) for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.). More detail on how the trigger concentrations were calculated is provided in Appendix B.1.

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the deep bedrock aquifer. As an alternative, 95 percent UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations. The UTLs were

calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.)

The following table provides the trigger levels for the above-referenced trigger parameters for the shallow and deep bedrock aquifer units.

Parameter	Shallow Unconfined Aquifer Trigger Level	Deep Bedrock Aquifer Trigger Level
Ammonia	4.0 mg/L	0.2 mg/L
Phosphorus	7.2 mg/L	0.5 mg/L
Dissolved Organic Carbon	34.6 mg/L	18.4 mg/L
Nitrate	1.3 mg/L	0.5 mg/L
Iron	48.3 mg/L	10.6 mg/L
Manganese	17.1 mg/L	2.1 mg/L
Alkalinity	633 mg/L	996 mg/L
Escherichia Coli	25.6 CFU/100 mL	5.0 CFU/100 mL

6.3 Trigger Level Assessment

The first Tier of the TLP consists of regular monitoring as outlined in Table 3.1. The second Tier of the TLP will be implemented if during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location. The tabulated analytical results for the shallow unconfined aquifer and deep bedrock aquifers (Tables 4.2 and 4.3, respectively) include a comparison to the established trigger level concentrations.

Tier II confirmatory monitoring consists of collecting follow-up water quality samples in duplicate from the location(s) that exceed the Tier I trigger levels. The Tier II confirmatory monitoring will be carried-out during the next scheduled monitoring event. Tier I monitoring will resume following confirmatory samples below the Tier I trigger levels.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

Shallow Unconfined Aquifer Assessment

The following table summarizes the results of the shallow unconfined groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2019 Tier	Trigger Level Exceedances			2020 Tier
		June	**September**	**November**	
MW1-08	I	None	-	None	I
MW2-08	I	None	-	None	I
MW3-08	-	None	-	None	I
MW4-08	-	None	-	None	I
MW5-09	I	Ammonia	None	Ammonia	I
MW101-13	II	Ammonia	None	Ammonia	I

Location ID	2019 Tier	Trigger Level Exceedances			2020 Tier
		June	**September**	**November**	
MW102-09	I	Ammonia	None	Ammonia	I
MW103-09	I	None	-	None	I
MW104-13	II	Ammonia	None	**Ammonia, Nitrate**	II
MW105-13	I	Ammonia	None	Ammonia	I
MW106-15	I	None	None	None	I

Note:
BOLD – Requires Tier II Sampling Protocol in 2020

As indicated in the above table, trigger level exceedances were noted in samples collected from five wells during 2019. At MW5-09, MW101-13, MW102-09, and MW105-13, only single trigger level exceedances persisted in 2019. Therefore, it is recommended that in 2020, MW5-09, MW101-13, MW102-09, and MW105-13 be sampled following Tier I protocols. Multiple trigger level exceedances (ammonia and nitrate) were noted at MW104-13 during November 2019. Therefore, MW104-13 will be sampled in duplicate following the Tier II sampling protocol in 2020.

As discussed above, the Site initiated a program of groundwater remediation in 2016 in response to elevated ammonia concentrations in shallow groundwater near and downgradient of the Facility. Operation of this system represents implementation of the contingency remedial response to observed groundwater quality impacts. Accordingly, future trigger level assessments should be undertaken for the purpose of tracking the evolution of groundwater quality as it relates to the remedial response, and should not necessarily be used for the purpose of triggering additional remedial response.

Convertus continues to explore groundwater treatment technologies which will reduce contaminant concentrations of all Trigger Contaminants, including ammonia, to levels below their respective PWQOs, thereby allowing the discharge of the treated effluent to surface water. As yet, no acceptable technology has been identified, but laboratory trials are still underway.

Deep Bedrock Aquifer

The following table summarizes the results of the deep bedrock groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2019 Tier	Trigger Level Exceedances			2020 Tier
		June	September	November	
TW-7	I	None	NA	None	I
TW-4	II	Ammonia	None	**Ammonia, Nitrate**	II
TW-8	I	**Ammonia, Nitrate**	NA	**Ammonia, Nitrate**	II

Notes:
BOLD – Requires Tier II Sampling Protocol in 2020
NA – Not Analyzed

TW-4 was sampled following Tier II protocols in June 2019 and ammonia continued to exceed its Tier I trigger level. In November 2019, concentrations of ammonia and nitrate exceeded their respective deep bedrock Tier I trigger levels at TW-4 (fall) and TW-8 (spring and fall). Therefore, it is recommended that that Tier II sampling be initiated at TW-4 and TW-8 in the spring of 2020.

7. MECP Correspondence

During the fall of 2018 Convertus received three letters from the MECP with comments in relation to the 2016 and 2017 Groundwater and Surface Water Monitoring Reports (GHD, 2017 and GHD, 2018). Convertus has not received comments from the MECP on the 2018 Groundwater and Surface Water Monitoring Report (GHD, 2019).

7.1 MECP Surface Water Comments

In a letter dated September 4, 2018 the MECP presented their review of the surface water monitoring portions of the 2016 and 2017 reports (GHD, 2017 and GHD, 2018). The letter describes the MECP's general concurrence with the interpretations and conclusions provided in the 2016 and 2017 Annual Monitoring Reports.

In addition, the letter provides a brief description of the available information related to grab sampling of pond discharge water by Golder Associates in April 2018. With respect to this sampling, the MECP indicates concurrence that the results of sampling do not constitute ECA non-compliance, as there is no requirement for sampling during discharge.

The MECP provides further concurrence with Convertus' statement that future exceedances of a trigger level within the SWMP during discharge should be addressed through the "Spill Contingency and Pollution Prevention Plan", required under Condition 5(6) of the ECA.

7.2 MECP Groundwater Comments

Convertus received two letters from the MECP dated November 13, 2018 and December 10, 2018 in relation to the 2016 and 2017 reports, respectively (GHD, 2017 and GHD, 2018). The following summarizes the comments provided by the MECP Technical Services Branch Hydrogeologist on the 2016 Annual Monitoring Report:

- Pumping volumes from EW107-15 were insufficient during 2016 and 2017.
- The bedrock aquifer is showing signs of impact.
- Sampling confirms that groundwater was impaired due to elevated nitrate nitrogen levels above the ODQWS MAC of 10 mg/l at MW104-13 on August 16, 2016 and at MW105-13 on August 16, 2016, and November 15, 2016.
- The extraction well must be operated more frequently to avoid further remedial measures and groundwater impairment as required by the Tier III Trigger Level Program.
- MECP reviewer was not in agreement with GHD that the existing single extraction well is the sole remedial measure that may be required to protect groundwater at this site.

In the December 10, 2018 letter the MECP reviewer commented on the 2017 report by noting that several trigger levels exceeded several times in the shallow aquifer and ongoing impact on deep groundwater.

As discussed above, Convertus made significant improvements in the configuration of the extraction well system during 2019. These improvements allowed for a significant increase in extraction of impacted groundwater from the shallow flow system. There is currently insufficient data to observe the effect of this increased pumping.

GHD recommends that samples are collected from EW107-15 on a monthly basis for 2 years in order to observe the effect of the increased pumping rate on groundwater quality in the interpreted source area. It is further recommended that the evolution of extracted groundwater quality at EW107-15 is used to guide future decisions concerning the possibility of incorporating a groundwater treatment facility into the remediation system, or future expansion of the groundwater extraction program.

8. Conclusions

The following conclusions have been developed based on results of the groundwater and surface water monitoring and sampling activities conducted in 2019:

1. Based on the groundwater elevations gathered in June, September and November 2019, shallow unconfined aquifer flow occurs in an east-northeast direction and groundwater in the deep bedrock aquifer flows in a west-southwest direction, opposite to the direction of the shallow unconfined aquifer.
2. Analytical results for the shallow unconfined aquifer samples indicate that groundwater quality at the Site is being affected by Facility operations. The distribution of elevated concentrations of ammonia, DOC, iron, and manganese are consistent with an area of localized impact related to an organic contaminant source.
3. Analytical sample results obtained from the deep bedrock aquifer unit monitoring wells indicate that groundwater quality in the deep bedrock aquifer is naturally poor. This observation is consistent with investigations of deep bedrock groundwater quality prior to Facility construction.
4. Improvements in water quality at downgradient deep bedrock monitoring well TW-8 have been observed during recent monitoring periods. There is currently insufficient data to confirm if the Facility is the source of sporadic water quality within the deep bedrock aquifer, however trends of decreasing concentrations in the downgradient deep bedrock monitoring wells suggest that the Facility is not significantly affecting this aquifer.
5. Surface water sample results indicate that surface water quality downstream of the Site was unaltered by Site activities during the 2019 monitoring period.
6. Surface water was discharged once from the on-Site Stormwater Management Pond during the 2019 monitoring period (April). All parameters were below their respective trigger levels listed in the Site ECA in samples collected from the Stormwater Management Pond prior to commencing discharging.

9. Recommendations

Based on the results of the water quality monitoring program conducted at the Facility, the following recommendations are presented:

1. The groundwater extraction system should be operated in such a manner that as much impacted groundwater from the shallow flow system is removed, as is practical.
2. The SCADA monitoring system should continue to be used to accurately record the volume of water pumped.
3. Groundwater samples should be collected from EW107-15 on a monthly basis for 2 years to observe the evolution of groundwater quality under the scenario of more consistent pumping. This more detailed water quality data should be used to inform decisions concerning future operation or expansion of the remediation system including the possibility of incorporating a proven groundwater treatment technology into the remediation system.
4. Tier II confirmatory sampling should be completed during the spring 2020 sampling event at MW104-13, TW-4, and TW-8.

SG-3	NS	NS	-	-	-	-	North Drainage Ditch	
SG-4	NS	NS	-	-	-	-	North Drainage Ditch	

Notes:

m AMSL metres above mean sea level.
m bgs metres below ground surface.
NI No Information.
NS Not Surveyed.
(1) The ground surface and reference elevations are based on ground surface next to well and the top of the riser pipe. respectively. MW6-08 to MW10-08 were surveyed in December 2009 and all remaining wells were resurveyed in June 2010.
The 2015-series wells have not yet been surveyed.
(2) Bedrock wells are open to the rock.
(3) Decommissioned, replaced by MW05-09
(4) Located on Tomlinson property; no longer accessible.
(5) Decommissioned, replaced by MW101-13

MW105-13	X	X	X	X		X	X	low-flow (peristaltic pump)
MW106-15	X	X	X	X		X	X	low-flow (peristaltic pump)
Deep Bedrock Water Table Unit Monitoring Locations (3 locations)								
TW-4	√	√	√	\		√	\	low-flow (peristaltic pump)
TW-7	√	√	√	\		√	\	low-flow (peristaltic pump)
TW-8	√	√	√	\		√	\	low-flow (bladder pump)
Groundwater Extraction Well Location (1 location)								
EW107-15	X	X	X	X		X	X	sample from discharge

Notes:

(1) General chemistry parameters - alkalinity, ammonia, DOC, nitrate, phosphorus turbidity, and un-ionized ammonia
(2) Additional Surface Water General Chemistry parameters analyzed at SW-4 during monthly sampling - BOD, COD, TKN, nitrite, total phenols, TSS, oil & grease, pH, arsenic, boron, cadmium, chromium, cobalt, copper, lead, mercury, nickel, zinc
(3) Metals - iron and manganese
(4) Surface water metals are total while groundwater metals are dissolved.
(5) 5 Escherichia coli (e.coli)
(6) SW-4 is sampled by CRA field staff on a bi-annual basis and monthly by Orgaworld staff (when it's safe to do so)
X Samples to be collected tri-annually (spring, summer, and fall)
\ Samples to be collected semi-annually (spring and fall)

003880

Parameters	**Units**	**PWQO** [1]		
Metals				
Iron	mg/L	0.3	0.324	0.368
Manganese	mg/L		0.127	0.113
General Chemistry				
Alkalinity, total (as CaCO3)	mg/L		238	164
Ammonia-N	mg/L		0.020	0.316
Dissolved organic carbon (DOC) (dissolved)	mg/L		4.23	5.92
Escherichia coli	cfu/100mL	100	52	280
Nitrate (as N)	mg/L		0.62	0.98
Phosphorus	mg/L	0.01	0.0171	0.0628
Turbidity	NTU		-	23.3
Un-ionized ammonia	mg/L	0.02	-	0.000524
Field Parameters				
Conductivity, field	mS/cm		2.08	1.5
Dissolved oxygen (DO), field	mg/L	>4	7.6	11.64
Oxidation reduction potential (ORP), field	millivolts		111	32
pH, field	s.u.	6.5-8.5	7.28	7.11
Temperature, field	Deg C		9.41	3.02
Turbidity, field	NTU		3.3	31.2

Notes:

(1) Ministry of the Environment and Energy (MOEE) Provincial Water Quality Objectives (PWQO), July 1994, reprinted February 1999.
ND Not detected at the associated reporting limit.
5.44 Concentrations is in excess of the PWQO.
* PWQO for dissolved oxygen is temperature dependent.

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 2844-9YNGZC
Issue Date: February 1, 2017

Orgaworld Canada Ltd.
150 Kent Street
London, Ontario
N6A 1L3

Site Location: Source Separated Organics Processing Facility
5123 Hawthorne Road South
Part of West Half of Lot 27, Concession 6
City of Ottawa
K1G 3Y3

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

existing sewage works for the collection, transmission, treatment and disposal of stormwater runoff & process / wash water from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central stormwater management (SWM) facility off-site (i.e. at the adjacent Hawthorne Industrial Park) which subsequently discharges to the Findlay Creek through a roadside ditch, for all storm events up to and including the 100 year return storm, consisting of the following:

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.

- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.

- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters

below trigger levels.

Part I Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	**Elevation** (metre)	**Storage Volume** (cubic metres)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:

    - inlet structure: A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;

    - overflow channel: A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.

- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;

- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.

- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.

- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide

over 80% total net annual TSS removal, discharging to a forebay of the wet pond;

- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m³/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;

- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.

- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	2-year	5-year	25-year	100-year
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

Part II Process Water Recirculation System

- a **Process Water Recirculation System** (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:

- six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m³ each;

- four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m³ respectively;

- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.

- piping for percolate/washdown water supply to the composting area including a sprinkling system;

- an odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water

and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned Works.

all in accordance with supporting documents listed in Schedule 'A'.

For the purpose of this environmental compliance approval, the following definitions apply:

"Application" means the application for an environmental compliance approval submitted to the Ministry for approval by or on behalf of the Owner and dated March 11, 2015;

"Approval" means this entire document and any schedules attached to it, and the Application;

"BOD_5"(also known as $TBOD_5$) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"$CBOD_5$"means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"COD" means Chemical Oxygen Demand;

"District Manager" means the District Manager of the Ottawa District Office of the Ministry;

"DOC" means Dissolved Organic Carbon;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for the purposes of Part II.1 of the EPA;

"*E. coli* " refers to the thermally tolerant forms of Escherichia that can survive at 44.5 degrees Celsius;

"EPA" means the *Environmental Protection Act, R.S.O. 1990, c.E.19* , as amended;

"Leachate Contaminated Sewage"means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Owner" means Orgaworld Canada Ltd., and its successors and assignees;

"OWRA" means the *Ontario Water Resources Act, R.S.O. 1990, c. O.40* , as amended;

"Substantial Completion" has the same meaning as "substantial performance" in the *Construction Lien Act* ; and

"Works" means the sewage works described in the Owner's application, and this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the terms and conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these terms and conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with this Approval.

(3) Where there is a conflict between a provision of this environmental compliance approval and any document submitted by the Owner, the conditions in this environmental compliance approval shall take precedence. Where there is a conflict between one or more of the documents submitted by the Owner, the Application shall take precedence unless it is clear that the purpose of the document was to amend the Application

(4) Where there is a conflict between the documents listed in the Schedule A, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The terms and conditions of this Approval are severable. If any term and condition of this environmental compliance approval, or the application of any requirement of this environmental compliance approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

(6) The issuance of, and compliance with the conditions of, this Approval does not:

(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement, including, but not limited to, the obligation

to obtain approval from the local conservation authority necessary to construct or operate the sewage Works; or

(b) limit in any way the authority of the Ministry to require certain steps be taken to require the Owner to furnish any further information related to compliance with this Approval.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of address of Owner or operating authority;

(b) change of Owner or operating authority or both, including address of new Owner or operating authority, or both;

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the *Business Names Act, R.S.O. 1990, c. B.17* ; and

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the "Initial Return" or "Notice of Change" filed under the *Corporations Information Act, R.S.O. 1990, c. C.39* , shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the Works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this condition refer to the number at the top of this environmental compliance approval.

3. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the Substantial Completion of the Works,a set of as-built drawings showing the Works as "constructed" shall be completed and submitted by the Owner to the District Manager.These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the Works or at operational office of the Owner for the operational life of the Works.

(2) The Owner shall inform in writing to the District Manager when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The Owner shall inform the District Manager of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

4. SURFACE WATER MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganic**	**Field Parameters**
BOD_5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen (TAN)	Chromium	Temperature
Total Kjeldahl Nitrogen (TKN)	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus (TP)	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after **two (2) years** of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The Owner shall retain for a minimum of **five (5) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

5. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(4) The Owner shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the Owner shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 4.(2). The Owner shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N	2.93
$CBOD_5$	15
Total Phosphorus (TP)	0.4
Total Suspended Solids (TSS)	15
E-coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the Owner shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 5.(2) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the Owner shall ensure that the contents of the SWM Pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner.

(8) The Owner shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to.

(9) Discharge of leachate contaminated sewage from the Works to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

(10) The Owner shall notify the District Manager orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The Owner shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation.

(13) The Owner shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or Owner's operational headquarters for inspection by the Ministry.The logbook shall include the following:

(a) the name of the Works;

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The Owner shall not store any end-product, including leaves and yard waste outdoors until the Owner prepares a Conditions Assessment and implementation plan approved by the District Manager. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

6. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

PART IV - GENERAL

7. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the Works, the Owner shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall

include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the Owner.

9. GROUNDWATER MONITORING

Groundwater Monitoring Program

(1) The Owner shall, upon the issuance of this Approval, carry out the following groundwater monitoring program. Samples shall be collected from the specified groundwater monitoring wells at the frequency specified, by means of the specified sample type and analyzed for each parameter listed and all results recorded:

Table 3 - Groundwater Monitoring

Unconfined Shallow Aquifer

MW1-08*, MW2-08*, MW3-08*, MW4-09*, & MW103-09*.

MW5-09**, MW101-13**, MW102-09**, MW104-13**, MW105-13**, MW106-15** & EW107-15**.

Deep Bedrock Aquifer

TW-4*, TW-7* & TW-8*.

Frequency	*Semi Annual (i.e. two times in a year) ** Tri-Annual (i.e. three time in a year)
Sample Type	Grab
Parameters	Alkalinity, Total Ammonia Nitrogen, Dissolved Organic Carbon, *E-coli* , Iron, Manganese, Nitrate-N, and Total Phosphorous.

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after three (3) years of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall compare analytical monitoring results obtained pursuant to Subsection (1) Table 3 - Groundwater Monitoring with the trigger level concentrations for the trigger parameter listed in Tables 4 and 5.

Table 4
Trigger Level Concentrations
Unconfined Shallow Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	633
Total Ammonia Nitrogen	4.0
Dissolved Organic Carbon	34.6
E-coli	25.6 CFU/100 mL
Iron	48.3
Manganese	17.1
Nitrate-N	1.3
Total Phosphorous	7.2

Table 5
Trigger Parameters
Deep Bedrock Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	996
Total Ammonia Nitrogen	0.2
Dissolved Organic Carbon	18.4
E-coli	5.0 CFU/100 mL
Iron	10.6
Manganese	2.1
Nitrate-N	0.5
Total Phosphorous	0.5

(5) The trigger level program shall be implemented using the following three (3) Tiers to verify the results and direct potential contingency implementation:

Tier I (Routine Monitoring Program)

Tier I Routine Monitoring Program (RMP) involves the sampling of all on-site groundwater monitoring wells at the frequency specified in Table 3. All groundwater monitoring activities completed at the site will be considered Tier I RMP unless two (2) or more trigger parameters exceed there respective trigger levels in a simple sample.

Tier II (Confirmation Monitoring Program)

If during a single monitoring event, two (2) or more trigger parameters exceed the established (see Tables 4 and 5) Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring Program (CMP) shall be implemented.

The Tier II CMP consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next schedule monitoring event in order to confirm the Tier I exceedance of the two (2) or more trigger parameters.

If the concentrations reported in the duplicate sample return to below their respective trigger levels, then Tier I RMP will resume.

If the Tier I exceedance is confirmed, then the next step shall be a re-evaluation of the degree, nature, and potential source(s) of the trigger level impact(s) identified in Tier I including the implication of the exceedance in terms of the potential for impacts to down-gradient off-site water users.

If the Tier II CMP and the subsequent evaluation indicate that the facility operations are having a detrimental effect on water quality migrating off-site, then Tier III Contingency Measures and Compliance Monitoring Program shall be implemented.

Tier III (Contingency Measures and Compliance Monitoring Program)

Tier III Contingency Measures and Compliance Monitoring Program (CMCMP) involves assessment and implementation of contingency measures in the event of imminent off-site groundwater quality impairment.

Contingency measures to be evaluated should include extraction of impacted groundwater and/or surface water for on-site treatment or off-site disposal, or acquisition of groundwater rights and registration of a contaminated attenuation zone (CAZ) on title of adjacent lands.

Tier III CMCMP should also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented.

The Tier III CMCMP details should be determined in conjunction with the development and implementation of preferred contingency measure(s).

The compliance monitoring parameters, locations, and monitoring frequency should be determined at the time of implementation of contingency measures.

Lastly, appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed.

(6) The Owner shall notify the District Manager orally, as soon as possible, and in writing within

seven (7) days in the event a trigger exceedance occurs.

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

10. REPORTING

(1) The Owner shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to Ministry staff.

(2) The Owner shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the Works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the Works;

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the District Manager requires from time to time.

SCHEDULE 'A'

1. Environmental Compliance Approval Application for Industrial Sewage Works submitted by Ben Constable, Conestoga-Rovers & Associates (CRA), and signed by Mike Rooke, Compliance Officer, Orgaworld Canada Ltd., dated March 11, 2015, and all supporting documentation and information.

2. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

3. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

4. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

5. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

6. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

7. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

8. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

9. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

10. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

11. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla,

P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

12. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

13. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

14. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

15. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

16. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. Condition 1.(6) is included to emphasize that the issuance of this Approval does not diminish any other statutory and regulatory obligations to which the Owner is subject in the construction, maintenance and operation of the Works. The condition specifically highlights the need to obtain any necessary conservation authority approvals. The condition also emphasizes the fact that this Approval doesn't limit the authority of the Ministry to require further information.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved Works and to ensure that subsequent owners of the Works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is included to ensure that the Works are constructed in accordance with the approval and that record drawings of the Works"as constructed" are maintained for future references.

4. Conditions 4 and 8 are included to enable the Owner to evaluate and demonstrate the performance of the Works,on a continual basis, so that the Works are properly operated and maintained at a level which is consistent with the design objectives specified in the Approval and that the Works does not cause any impairment to the receiving watercourse.

5. Conditions 5, 6 and 7 are included to require that the Works be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the Ministry.

6. Condition 9 is included to provide a performance record for future references, to ensure that the Ministry is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this Approval, so that the Ministry can work with the Owner in resolving any problems in a timely manner.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 7251-8GKRPD issued on May 30, 2011.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

1. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The environmental compliance approval number;
6. The date of the environmental compliance approval;
7. The name of the Director, and;
8. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment and Climate Change
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 314-4506 or www.ert.gov.on.ca**

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 1st day of February, 2017

Fariha Pannu.

Fariha Pannu, P.Eng.
Director
appointed for the purposes of Part II.1 of the
Environmental Protection Act

AA/
c: District Manager, MOECC Ottawa District Office
Ben Constable, Conestoga-Rovers & Associates (CRA)

Ministry of the Environment
Ministère de l'Environnement

AMENDED CERTIFICATE OF APPROVAL
INDUSTRIAL SEWAGE WORKS
NUMBER 7251-8GKRPD
Issue Date: May 30, 2011

Orgaworld Canada Ltd.
4675 Wellington Rd S
London, Ontario
N6K 0C7

Site Location: 5123 Hawthorne Road South
Lot Part of West Half of 27, Concession 6
Ottawa City,
K1G 3Y3

You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

the establishment of stormwater management *Works* for the collection, transmission, treatment and disposal of stormwater runoff and process/wash sewage from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central SWM facility off site (adjacent Hawthorne Industrial Park), and subsequently discharging through a ditch to Findlay Creek, for all storm events up to and including the 100 year return storm, consisting of the following:

PROPOSED WORKS

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.
- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.
- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters below trigger levels.

EXISTING WORKS

Part 1 Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	Elevation (m)	Storage Volume (m^3)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:
    1. Inlet structure. A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;
    2. Overflow channel. A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.
- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;
- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.
- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.
- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide over 80% total net annual TSS removal, discharging to a forebay of the wet pond;
- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;
- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.
- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

The above, including erosion/sedimentation control measures during construction and all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

Part II <u>Process Water Recirculation System</u>

- A Process Water Recirculation System (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:
- Six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;
- Four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;
- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.
- Piping for percolate/washdown water supply to the composting area including a sprinkling system;
- An odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- Piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

All in accordance with the following submitted supporting documents:

1. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

2. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

3. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

4. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

5. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

6. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

7. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

8. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

9. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

10. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

11. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

12. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

13. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

14. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

15. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

CONTENT COPY OF ORIGINAL

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"*Act*" means the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, as amended;

"*BOD5*" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"*CBOD5*" means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"*Certificate*" means this entire certificate of approval document, issued in accordance with Section 53 of the *Act*, and includes any schedules;

"*COD*" means Chemical Oxygen Demand;

"*Director*" means any *Ministry* employee appointed by the Minister pursuant to section 5 of the *Act*;

"*District Manager*" means the District Manager of the Ottawa District Office of the Ministry;

"*DOC*" means Dissolved Organic Carbon;

"*Leachate Contaminated Sewage*" means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"*Ministry*" means the Ontario Ministry of the Environment;

"*Owner*" means Orgaworld Canada Ltd., also referred as OCL, and includes its successors and assignees;

"*Substantial Completion*" has the same meaning as "*substantial performance*" in the Construction Lien Act; and

"*Works*" means the sewage works described in the *Owner's* application, this *Certificate* and in the supporting documentation referred to herein, to the extent approved by this *Certificate.*

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL PROVISIONS

(1) The *Owner* shall ensure that any person authorized to carry out work on or operate any aspect of the *Works* is notified of this *Certificate* and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these Conditions, the *Owner* shall design, build, install, operate and maintain the *Works* in accordance with the description given in this *Certificate* the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this *Certificate.*

(3) Where there is a conflict between a provision of any submitted document referred to in this *Certificate* and the Conditions of this *Certificate*, the Conditions in this *Certificate* shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the listed submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The requirements of this *Certificate* are severable. If any requirement of this *Certificate*, or the application of any

CONTENT COPY OF ORIGINAL

requirement of this *Certificate* to any circumstance, is held invalid or unenforceable, the application of such requirement to other circumstances and the remainder of this certificate shall not be affected thereby.

2. EXPIRY OF APPROVAL

The approval issued by this *Certificate* will cease to apply to those parts of the *Works* which have not been constructed within **five (5) years** of the date of this *Certificate.*

3. CHANGE OF OWNER

(1) The *Owner* shall notify the *District Manager* and the *Director*, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of *Owner;*

(b) change of address of the *Owner;*

(c) change of partners where the *Owner* is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Business Names Act, R.S.O. 1990, c.B17 shall be included in the notification to the *District Manager;*

(d) change of name of the corporation where the *Owner* is or at any time becomes a corporation, and a copy of the most current information filed under the Corporations Information Act, R.S.O. 1990, c. C39 shall be included in the notification to the *District Manager;*

(2) In the event of any change in ownership of the *Works*, other than a change to a successor municipality, the *Owner* shall notify in writing the succeeding owner of the existence of this *Certificate*, and a copy of such notice shall be forwarded to the *District Manager* and the *Director.*

4. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the *Substantial Completion* of the *Works*, a set of as-built drawings showing the *Works* as "constructed" shall be completed and submitted by the *Owner* to the *District Manager.* These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the *Works* or at operational office of the *Owner* for the operational life of the *Works.*

(2) The *Owner* shall inform in writing to the *District Manager* when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The *Owner* shall inform the *District Manager* of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

5. SURFACE WATER MONITORING AND RECORDING

(1) The *Owner* shall, upon commencement of operation of the *Works*, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

CONTENT COPY OF ORIGINAL

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganics**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's Procedure F-10-1, "Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works (Liquid Waste Streams Only), as amended from time to time by more recently published editions;

(b) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (January 1999), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(c) the publication "Standard Methods for the Examination of Water and Wastewater" (20th edition), as amended from time to time by more recently published editions;

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after two (2) years of operation of the *Works* in accordance with this Condition, be modified by the *District Manager* in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The *Owner* shall retain for a minimum of **three (3) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this *Certificate*.

6. OPERATION AND MAINTENANCE

(1) Up on commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* prepared in accordance with Condition (8) is submitted to the *District Manager* for comments and concurrance;

(2) Upon commencement of operation of the *Works*, the *Owner* shall implement all operating procedures identified in the operations manual. This manual shall include, but not necessarily be limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

(4) The *Owner* shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the *Owner* shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 5(2). The *Owner* shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the *Owner* shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 6 (1) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the *Owner*shall ensure that the contents of the SWM pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner;

(8) The *Owner*shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to;

(9) Discharge of leachate contaminated sewage from the *Works*to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage;

(10) The *Owner* shall notify the *District Manager* orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The *Owner* shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The *Owner* shall inspect the *Works* at least once a year and, if necessary, clean and maintain the *Works* to prevent the excessive build-up of sediments and/or vegetation.

(13) The *Owner* shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or *Owner's* operational headquarters for inspection by the *Ministry*. The logbook shall include the following:

(a) the name of the *Works;*

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The *Owner* shall not store any end-product, including leaves and yard waste outdoors until the *Owner* prepares a Conditions Assessment and implementation plan approved by the *District Manager*. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

7. OPERATION AND MAINTENANCE

(1) Before the commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* is prepared as per Condition (8), submitted to the *District Manager;*

(2) Up on commencement of operation of the *Works*, the *Owner* shall implement all operational procedures identified in the operation manual. The operation manual shall include, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

CONTENT COPY OF ORIGINAL

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

PART IV - GENERAL

8. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the *Works,*the *Owner*shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the

CONTENT COPY OF ORIGINAL

operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the *Owner*.

9. GROUNDWATER MONITORING

Upon issuance of this *Certificate*, the *Owner* shall establish the following groundwater monitoring program with monitoring wells located as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates.

(1) For the unconfined shallow groundwater aquifer, the *Owner* shall establish and maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing eight (8) monitoring wells designated as: MW1-08 to MW5-08; and MW101 to MW103 and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(2) For the confined deep bedrock aquifer, the *Owner* shall maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing three (3) monitoring wells designated as: TW-4, TW-7, and TW-8 (within the Orgaworld Canada Ltd. site), and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(3) Within **sixty (60) days** of the issuance of this Certificate, the *Owner* shall:

(a) complete an assessment of the groundwater quality for each stratrigraphic unit:

(b) develop criteria in accordance with the Ministry Guideline B-7 - Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities; and

(c) submit to the *District Manager* for review and concurrence.

(4) The *Owner* shall collect groundwater samples twice per year - in May and November - from the monitoring wells listed at subsections (1) and (2), and increase the sampling frequency to four times per year - in February, May, August and November - for the three new wells MW101, MW102, and MW103.

(5) The Owner shall have the samples collected pursuant to subsection (2) filtered and analyzed for Alkalinity, Colour, Iron, Manganese, Cadmium, Molybdenum, Zinc, Petroleum Hydrocarbons fractions, Anthracene, arsenic, E.Coli, feacal coliforms, total coliforms, Total Disssolved Solids (TDS), DOC, turbidity, pH, CBOD5, temperature, using the analytical protocols listed at Condition 5 (2).

(6) The Owner shall measure the water level elevation in each of the monitoring wells identified in subsection (1) and (2) at the time of collection of water samples pursuant to subsections (4).

(7) The measurement frequencies specified in subsection (4) in respect of any parameter are minimum requirements which may, after **two (2) years** of operation of the Works, be modified by the *District Manager* in writing from time to time.

(8) After **two (2) years** of operation of the *Works*, the *Owner* shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this *Certificate* to the *Director* and the *District Manager*.

10. REPORTING

(1) **One (1) week** prior to the start up of the operation of the *Works*, the *Owner* shall notify the *District Manager* (in writing) of the pending start up date.

(2) The *Owner* shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to *Ministry* staff.

(3) The *Owner* shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the

CONTENT COPY OF ORIGINAL

period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the *Works* and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works;*

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the *District Manager* requires from time to time.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the *Works* are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the *Certificate* and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. The condition also advises the Owners their responsibility to notify any person they authorized to carry out work pursuant to this *Certificate* the existence of this *Certificate.*

2. Condition 2 is included to ensure that, when the *Works* are constructed, the *Works* will meet the standards that apply at the time of construction to ensure the ongoing protection of the environment.

3. Condition 3 is included to ensure that the *Ministry* records are kept accurate and current with respect to the approved works and to ensure that subsequent owners of the *Works* are made aware of the *Certificate* and continue to operate the *Works* in compliance with it.

4. Condition 4 is included to ensure that the *Works* are constructed in accordance with the approval and that record drawings of the *Works* "as constructed" are maintained for future references.

5. Conditions 5 and 9 are included to enable the *Owner* to evaluate and demonstrate the performance of the *Works,* on a continual basis, so that the *Works* are properly operated and maintained at a level which is consistent with the design objectives specified in the *Certificate* and that the *Works* does not cause any impairment to the receiving watercourse.

6. Conditions 6, 7 and 8 are included to require that the *Works* be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the *Ministry.*

7. Condition 10 is included to provide a performance record for future references, to ensure that the *Ministry* is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this *Certificate,* so that the *Ministry* can work with the *Owner* in resolving any problems in a timely manner.

This Certificate of Approval revokes and replaces Certificate(s) of Approval No. 7032-88XPRA issued on September 7, 2010.

CONTENT COPY OF ORIGINAL

written notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 101 of the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

1. The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Certificate of Approval number;
6. The date of the Certificate of Approval;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/28	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Recommended Compliance and Trigger Level Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline a recommended groundwater Compliance and Trigger Level Program (TLP) for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Facility) located at the 5123 Hawthorne Road, Ottawa, Ontario (Site). The TLP has been developed to satisfy Condition 9(8) of the Environmental Compliance Approval (Industrial Sewage Works No. 7251-8GKRPD) (ECA) for the Site and is being submitted in support of an application to amend the ECA. The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

The following Section discusses the results of previous assessments of groundwater compliance and trigger level assessments for the Site. A recommended TLP for the Site is presented in Section 3.0.

2.0 Background

The OCL Site is approximately 10 hectares in area and is situated in the southwest corner of the Hawthorne Industrial Park (HIP) subdivision, which covers an area of approximately 80 hectares. Since the early/mid 1990's, the HIP subdivision has historically received excess fill materials from various construction and demolition projects, which is understood to consist primarily of clean soil with some concrete debris and reclaimed asphalt pavement and aggregate materials, and has also been intermittently used for temporary storage of various construction related materials. The area surrounding the HIP subdivision has a number of mineral aggregate extraction operations in place (south-east, west, and north-west of HIP), some of which are still active. The OCL Site was also subject to mineral aggregate removals prior to Facility development by OCL. Given the historic and ongoing land uses around the subject Site, there is the potential for soil, groundwater, and surface water quality impairment related to the various past activities.

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

As part of the ECA development for this Site, the MOE requested a groundwater monitoring program be implemented to ensure that the proposed operation of the OCL Facility does not adversely affect the surrounding environment (there are concerns for downstream agricultural users of the shallow/surface water regime, and for the deeper-aquifer which supplies potable water to a number of nearby properties). The purpose of the groundwater monitoring program is to evaluate the potential impact of OCL activities on the groundwater and surface water quality; regular monitoring allows for the analysis of trends over time and ensures there is an early warning of potential problems.

Previous assessments of groundwater quality at the Site have identified pre-existing groundwater quality as an obstacle to developing a functional TLP for groundwater in the current Site context. Historical backfill material used on Site, as well as historical and surrounding land uses have resulted in highly variable groundwater quality. For this reason, typical assessments using generic water quality standards as the basis for assessing compliance at the Site boundary do not provide meaningful indications of the effects of Facility operations on groundwater quality.

Condition 9(3b) of the ECA requires the development of criteria in accordance with MOE Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). CRA initially completed an assessment of on-Site water quality in accordance with the Reasonable Use Concept in a memo to Tracy Hart of the MOE dated February 5, 2010. Assessments of water quality provided in Annual Monitoring Reports following submission of the February 5, 2010 memo concluded that the application of the Reasonable Use Concept at the downgradient property boundary is irrelevant due to the presence of numerous parameters elevated above generic standards in background water quality. As such, the Site-specific criteria calculated using the Reasonable Use Concept are not considered appropriate for evaluating Site compliance.

A groundwater trigger level assessment that used intra-well baseline data was provided in the 2012 Annual Monitoring Report for the Site. This type of assessment can be useful for identifying potential increases in groundwater quality impacts by comparing current data to statistically-based upper tolerance limits (UTLs) developed from historical data at individual wells. However, the use of trigger levels based on intra-well baseline UTLs is not considered appropriate for the Site for the following reasons:

1. There is insufficient pre-start-up data to provide statistically valid intra-well baseline data.
2. The intra-well baseline method does not account for the movement of pre-start-up water quality impacts from one portion of the Site to another. Based on the highly variable water quality on-Site prior to start-up of Facility operations, this could yield false triggers in downgradient on-Site monitoring wells.

3.0 Recommended Compliance and Trigger Level Program

For the purposes of assessing potential groundwater quality impairments related to the activities approved under the ECA, comparison of post-start-up data to pre-start-up data provides a useful comparison. Water quality data from pre-start-up monitoring demonstrated considerable variability within the shallow unconfined aquifer across the Site. This pattern is consistent with variable pre-existing sources of water

quality impacts upgradient and/or on-Site. Some sources of water quality impacts un-related to the Facility operations include: current and historical quarrying operations located upgradient of the Site, historical backfill materials used for grading at the Site, and various other current and historical industrial and agricultural activities in the vicinity.

Therefore, in consideration of the variable water quality pre-existing Facility operations, it is recommended that the aggregate Site-wide pre-start-up water quality data be used as the basis for establishing groundwater trigger levels for the shallow unconfined aquifer. The pre-start-up data is all data collected from shallow unconfined aquifer monitoring wells between July 2008 and January 2010. By using an appropriate statistical representation of the overall pre-existing water quality, the trigger levels will provide indications of new water quality impairments, not related to historical activities. This method will reduce the potential for trigger levels being exceeded at specific on-Site monitoring locations due to the migration of pre-existing water quality impairments within the Site boundaries.

It is recommended that the groundwater trigger level program focus on a reduced set of parameters that reflect the sources of potential impact from on-Site activities. These parameters will thus act as surrogates for Site-related water quality impacts. Based on a review of water quality data for the Site and the known sources of impact associated with organic waste processing, the trigger level program should include the following trigger parameters: ammonia, phosphorus, dissolved organic carbon, nitrate, iron, manganese, alkalinity and E. coli.

Ammonia, phosphorus, dissolved organic carbon; nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants to the subsurface.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Shallow Unconfined Aquifer

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the shallow unconfined aquifer. The trigger levels are based on the 95% UTLs for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	4.0 mg/L
Phosphorus	7.2 mg/L
Dissolved Organic Carbon	34.6 mg/L
Nitrate	1.3 mg/L
Iron	48.3 mg/L
Manganese	17.1 mg/L
Alkalinity	633 mg/L
E. coli	25.6 CFU/100mL

Deep Bedrock Unit

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the bedrock aquifer. As an alternative, 95% UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations.

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the bedrock aquifer. The trigger levels are based on the 95% (UTL) for upgradient (TW-7) groundwater data in the bedrock aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	0.2 mg/L
Phosphorus	0.5 mg/L
Dissolved Organic Carbon	18.4 mg/L
Nitrate	0.5 mg/L
Iron	10.6 mg/L
Manganese	2.1 mg/L
Alkalinity	996 mg/L
E. coli	5.0 CFU/100mL

A pumping test completed in 2008 within the deep bedrock unit as part of the Phase II ESA confirmed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. For this reason, any exceedances of the above-referenced trigger levels for the deep bedrock unit should be reviewed in conjunction with other monitoring data to assess whether or not the exceedances are related to Facility operations. It is unlikely that Facility operations will affect deep bedrock unit water quality.

Trigger level program - Tiers

The TLP should be implemented using a series of three Tiers to verify the results and direct potential contingency implementation. The following paragraphs describe the three Tiers recommended to be included as part of the TLP.

Tier I – Routine Monitoring and Trigger Locations

Tier I monitoring involves the sampling of all on-Site groundwater monitoring wells at the frequency prescribed in the Site environmental monitoring program. All groundwater monitoring activities completed at the Site will be considered Tier I monitoring unless two or more trigger parameters exceed their respective trigger levels in a single sample.

Groundwater monitoring will be conducted at the Site, as follows:

- Tri-annually (three times per year) at MW101-13, MW102-09, MW104-13, MW105-09, MW5-09, MW106-15*
- Semi-annually (twice per year) at all remaining overburden and bedrock monitoring wells, respectively MW1-08, MW2-08, MW3-08, MW4-09, and MW103-09

*-Not yet installed

Tier II – Confirmation Monitoring

If during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring program will be implemented. The Tier II Confirmation Monitoring program consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next scheduled monitoring event in order to confirm the Tier I exceedance of the two or more trigger parameters. If the concentrations reported in the duplicate samples return to below their respective trigger levels, then Tier I monitoring will resume.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

The comparison of the observed water quality to generic criteria, the applicable regulatory compliance framework, the pre-existing water quality, and downgradient use of groundwater will dictate the timing and urgency of response. The comparison should also include parameter trend analyses over time and the contributions of sources of impact other than the Facility. If the Tier II Confirmation Monitoring program and subsequent evaluation indicate that Facility operations are having a detrimental effect on water quality migrating off-Site, then Tier III - Contingency Measures will be implemented.

Tier III – Contingency Measures and Compliance Monitoring

The Tier III portion of the TLP involves assessment and implementation of contingency measures in the event of imminent off-Site groundwater quality impairment. Contingency measures to be evaluated would include extraction of impacted groundwater and/or surface water for on-Site treatment or off-Site disposal, or acquisition of groundwater rights and registration of a contaminant attenuation zone on title of adjacent lands.

Tier III also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented. The Tier III compliance monitoring program details would be determined in conjunction with the development and implementation of preferred contingency measure(s). The compliance monitoring parameters, locations and monitoring frequency would be determined at the time of implementation of contingency measures.

Appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed. As the nature of potential future water quality issues cannot be known in advance, it is not practical to develop remediation plans that will necessarily best suit the particular situation in the event of water quality impairment.

4.0 Closing

It is recognized that using pre-existing water quality data as the basis for the groundwater trigger level program will not necessarily provide an effective measure of the potential for off-Site migration of adverse water quality, as it relates to adjacent water uses. For this reason, it is necessary that evaluations of water quality included within the Annual Monitoring Reports take into consideration the potential for impairment of downgradient water quality uses, regardless of the nature of the source of the impact (off-Site sources, Facility operations, historical impacts, etc.).

As such, evaluations of the shallow unconfined aquifer should compare water quality adjacent to surface water courses to the Provincial Water Quality Objectives (PWQOs) to assess the potential effects of shallow groundwater discharging to surface. Evaluations of deep bedrock groundwater should compare water quality to the Ontario Drinking Water Quality Standards (ODWQSs).

MEMORANDUM

January 3, 2017

TO: Kyle Straberger
Senior Environmental Officer
Peterborough District Office
Eastern Region

MINISTRY OF THE ENVIRONMENT
JAN 11 2017
OTTAWA

FROM: Bob Holland
Hydrogeologist
Water Resources Unit
Technical Support Section
Eastern Region

RE: Orgaworld Organics Facility
2015 Groundwater and Surface Water Monitoring Report
Trigger Level Program
5123 Hawthorne Road
City of Ottawa
Hydrogeologic Assessment

I have reviewed the above noted report signed by Conestoga Rovers & Associates March 31, 2016 describing groundwater impacts related to the Orgaworld Organics Facility in Ottawa. The report also provides the Trigger Level Program (TLP) to protect groundwater from the impact of this new facility.

The consultant provides an assessment of the physical hydrogeology of the site. A shallow aquifer exists at the bedrock overburden interface. Water level monitoring has confirmed the inferred groundwater flow direction in the upper unconfined aquifer is to the east with some level of limited discharge to ditches located along the north site boundary. The Surface Water Unit should review this report as groundwater that does not meet Provincial Water Quality Objectives for ammonia may at times discharge to these ditches.

A deep aquifer exists in sandstone. Based on in-situ hydraulic testing the consultant has deemed there is no hydraulic connection between the deep aquifer and the unconfined shallow aquifer. Inferred groundwater flow in the deep aquifer is to the west. Contaminants of concerns identified are ammonia, iron, manganese, dissolved organic carbon, sulfate, and total dissolved solids. Groundwater quality mapping of ammonia, DOC, iron and manganese confirm that a plume extends in the shallow aquifer northeastward, originating in and around the northeast corner of the Organic Composting Facility. Some impacts have been detected in the deep aquifer.

A TLP has been proposed recognizing that past site activities and up gradient water quality issues exist and that an alternative method has been developed to assess the net impact of this new facility, bearing in mind that groundwater impairment must not occur. I have reviewed the proposed TLP and find it is acceptable to me.

I find the monitoring program rationalization acceptable to me.

In general, I agree with the conclusion and recommendations made by the consultant. Current remediation efforts must continue to improve groundwater quality at all down gradient monitoring wells relative to facility start up and any additional work as per the TLP. If a Tier III trigger is reached I should be consulted.

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/27	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Proposed Monitoring Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline the proposed groundwater and surface water monitoring programs for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Site) located at 5123 Hawthorne Road, Ottawa, Ontario. This memorandum has been prepared in support of an application to amend ECA No. 9465-7NVRWT (Industrial Sewage Works). The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

1.1 Current Monitoring Program

The current monitoring program for the Site is defined in the above-referenced ECA and includes hydraulic monitoring and sampling at 11 groundwater monitoring well locations within the shallow unconfined aquifer and 3 groundwater monitoring wells in the deep bedrock aquifer unit. The monitoring program also includes sampling at 4 surface water locations. The following locations are currently sampled on a semi-annual basis (twice per year):

Unconfined Shallow Aquifer	*Deep Bedrock Aquifer*	*Surface Water*
MW1-08	TW-4	SW-1
MW2-08	TW-7	SW-2
MW3-08	TW-8	SW-3
MW4-08		SW-4
MW4-09		

ISO 9001

The following locations are sampled on a quarterly basis.

Unconfined Shallow Aquifer
MW5-09
MW101-13
MW102-09
MW103-09
MW104-13
MW105-13

The current analytical parameter list for the Site, as per the Site's Environmental Compliance Approval (ECA No. 7251-8GKRPD, as amended) consists of selected general chemistry, bacteriologic components, metals, petroleum hydrocarbons (PHCs), and polycyclic aromatic hydrocarbons (PAHs).

A complete summary of the current monitoring program is provided in Table 1.

2.0 Proposed Monitoring Program

Based on the results of monitoring completed to date, there is sufficient data collected to warrant reductions in the monitoring program. The reductions in monitoring include changes in monitoring frequency at selected locations and removal of several analytical parameters from the list of analytes. The following sections discuss the proposed changes to the monitoring program.

2.1 Monitoring Frequency

A significant amount of monitoring data has been collected to date for the on-Site monitoring wells. The monitoring data has allowed for a comprehensive understanding of the spatial and temporal patterns in groundwater quality. As groundwater quality is generally well understood, it is recommended that monitoring frequency be reduced at selected locations.

During recent monitoring years, field staff has been unable to complete the winter monitoring event during February due to frozen monitoring wells. For this reason, it is recommended that the winter (February) monitoring event be removed from the monitoring program. Three monitoring events (spring, summer, and fall) should be maintained per year at locations where detailed groundwater monitoring is suitable.

The following table summarizes the recommended groundwater monitoring frequency.

Location	*Current Sampling Frequency*	*Proposed Sampling Frequency*	*Unit*	*Trigger Well*
MW101-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW102-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW103-09	Quarterly	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW1-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW2-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW3-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW4-09	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW5-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW104-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW105-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW106-15	NA	Tri-Annual	Unconfined Shallow Aquifer	Yes
EW107*	NA	Tri-Annual	Unconfined Shallow Aquifer	No
TW-4	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-7	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-8	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No

*- Not yet installed
+ - Upgradient well
NA – Not applicable

As indicated in the above table, the recommended changes to the monitoring program include:

- Reduction of monitoring from quarterly to tri-annual (three times per year) at selected locations
- Reduction of monitoring from quarterly to semi-annual at MW103-09. This location is located away from verified sources of impact and semi-annual monitoring will provide adequate water quality data at this location.

It should be noted that the monitoring frequency specified above is consistent with the monitoring frequency proposed in the updated TLP.

Groundwater monitoring well (MW106) and extraction well (EW107) have not yet been installed, but are scheduled for installation prior to the spring 2015 monitoring event. These wells should be incorporated into the monitoring program at the monitoring frequency specified above, following installation.

Surface water sampling is currently conducted at two upstream locations: SW1-09 and SW2-09. The analytical results have generally been consistent between these two locations. As there are no Site-related sources of impact between SW-1 and SW-2, it is recommended that sampling at SW-1 be discontinued. As such, surface water quality monitoring should continue semi-annually at locations SW2-09 and SW3-09. SW4-09 should continue to be sampled on a monthly basis (when weather conditions permit safe sampling at this location).

2.2 Monitoring Parameters

The existing monitoring program includes sampling of groundwater and surface water for PHC and PAH parameters. The results of PHC and PAH analyses have demonstrated largely non-detect results for the majority of these parameter lists. The sporadic detections of PHCs or PAH parameters have been inconsistent and at very low concentrations often just above the detection limits. In addition, similar infrequent low-level detections have also been reported at background monitoring locations. Therefore, it is likely that any detection of PHCs or PAHs parameters are the result of background conditions and/or related to fill materials historically used in the vicinity of the Site. Thus, PHCs and PAHs are not considered useful in evaluating groundwater and surface water for potential environmental impacts related to Site operations.

It is recommended that PHCs and PAHs be removed from the current monitoring parameter list.

The recommended monitoring program for the Site is summarized in Table 2.

MEMORANDUM

TO:	Ministry of the Environment	REF. NO.:	045804-22
FROM:	Ben Kempel/Ben Constable/mg/25	DATE:	July 16, 2014
CC:	Tej Gidda, Ron Cherkewski, Mike Rooke		
RE:	**Groundwater Assessment and Work Plan - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates (CRA) has prepared this memorandum on behalf of Orgaworld Canada Ltd. (Orgaworld) to provide the Ministry of Environment (MOE) with the results of supplementary data assessment completed on groundwater monitoring data for the Orgaworld organic waste processing facility (Facility) located at 5123 Hawthorne Road, Ottawa, Ontario (Site). The assessment has been undertaken in response to identified increases in ammonia concentrations within shallow groundwater downgradient of the Facility. The assessment has focused on monitoring data for the most recent (2013) monitoring period and included the following activities:

- 2013 Data Assessment – Ammonia (Section 2.0)
- Additional Parameters of Concern (Section 3.0)
- Groundwater Discharge to Surface (Section 4.0)
- Data Gap Analysis (Section 5.0)

CRA has prepared a work plan for further investigating and characterizing groundwater at the Site. The purpose of the additional investigation is to refine the ammonia plume delineation, improve understanding of the aquifer properties on-Site, and determine the potential receptors associated with the plume.

Orgaworld currently operates under the following Environmental Compliance Approvals (ECA's) for the Site:

- Number 7021-7HQNDE (Air), September 16, 2009
- Number 9465-7NVRWT (Industrial Sewage Works), September 16, 2009
- Number 7032-88XPRA (Industrial Sewage Works), Amended September 7, 2010
- Number 7251-8GKRPD (Industrial Sewage Works), Amended May 30, 2011
- Number 2766-7HEPSZ (Waste Disposal Site), September 16, 2009, Amended under Notice No. 1, October 21, 2010

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

Condition 9 (8) of ECA Number 7251-8GKRPD requires that Orgaworld establish a comprehensive Compliance and Trigger Level Monitoring Program based on groundwater monitoring within two years of operations. The Compliance and Trigger Level Monitoring Program is to be submitted to the MOE along with an application to amend the ECA. Orgaworld has not applied to amend the ECA, as the monitoring data gathered since 2010 to define baseline conditions for the site has been influenced by both existing conditions at the Site, largely comprised of historical fill materials and adjacent to quarrying activities, and potentially the Facility's operations. This work plan has been specifically designed to present results and interpretation of the historical and current data and to define steps moving ahead to address groundwater quality.

The following sections discuss the results of the assessment and describe the proposed work plan.

2.0 2013 Data Assessment - Ammonia

Interpretations of pre-2013 analytical data identified the existence of an ammonia plume within shallow groundwater originating near the eastern side of the organics composting facility and migrating to the northeast towards the Site boundary. Elevated concentrations of ammonia were originally reported in historic monitoring well MW101-09 in May 2010. Elevated ammonia concentrations were detected in monitoring wells located downgradient of MW101-09 during subsequent monitoring events. Ammonia concentrations were observed to increase within the interpreted source area (MW101-09) and downgradient Site boundary monitoring wells (MW5-09, MW102-09) through 2012. Based on a review of 2013 data, elevated ammonia concentrations are persistent within the source area and concentrations continued to increase through 2013 at the downgradient monitoring wells. The Site groundwater monitoring network is illustrated on the attached Site Plan (Figure 1).

Monitoring well MW101-09 was abandoned during 2012 due to suspicions that the well integrity may have been compromised. In addition, several new monitoring wells were installed near the interpreted source area in early 2013. The analytical results from the initial year of sampling at MW101-13 and MW104-13 confirm that elevated concentrations of ammonia exist immediately downgradient of former historic monitoring well MW101-09. The analytical results from MW105-13 show that the elevated concentrations of ammonia are also present to the northeast of MW101-09.

Figures 2 through 7 illustrate ammonia concentrations versus time for the monitoring wells within the source area and downgradient along the Site boundary. As depicted in the Figures, ammonia concentrations have demonstrated increasing trends at monitoring wells MW104-13, MW5-09, MW102-09, and MW101-13.

3.0 Additional Parameters of Concern

A comparison of the 2012 through 2013 analytical data for downgradient monitoring wells (MW5-09, MW102-09, MW1-08) located along the northern Property boundary to the Ontario Drinking Water Standards (ODWS) and upgradient water quality at MW3-08 was completed to identify additional parameters of potential environmental concern within shallow groundwater. Based on this comparison,

several general chemistry and metals parameters have been reported at concentrations above their respective ODWS criteria, and significantly elevated above upgradient levels. The following additional parameters have been identified as potential parameters of concern. The maximum reported downgradient, Site boundary concentrations and respective ODWS criteria (in brackets) are as follows:

- Iron – 7.5 mg/L (0.3 mg/L)
- Manganese – 4.8 mg/L (0.05 mg/L)
- Dissolved Organic Carbon – 12.1 mg/L (10 mg/L)
- Sulfate – 872 mg/L (200 mg/L)
- Total Dissolved Solids – 2030 mg/L (500 mg/L)

It should be noted that, similar to the trend noted for ammonia, the concentrations of the above parameters have generally demonstrated increasing trends during recent years at monitoring wells immediately downgradient of the Facility.

Figures 8 through 11 provide concentration isopleths for ammonia, dissolved organic carbon (DOC), dissolved iron, and dissolved manganese based on the median sample results from 2013 monitoring in monitoring wells completed within the shallow aquifer. Each figure illustrates the presence of elevated concentrations in the interpreted source area and downgradient towards the northern Site boundary. Elevated concentrations of iron, manganese, DOC and TDS are consistent with the interpretation that the contaminant plume is related to an organic contaminant source. As indicated on these figures, there is little known about the western extent of the plume near the northern Site boundary. The proposed work plan for addressing this data gap is discussed in Section 5.3.

4.0 Groundwater Discharge to Surface

The presence of elevated ammonia concentrations within shallow groundwater is primarily a potential concern with respect to the discharge of shallow groundwater to surface water, due to the relatively low Provincial Water Quality Objective (PWQO) for un-ionized ammonia (0.02 mg/L). As such, it is recommended that the hydraulic relationship between shallow groundwater and surface water be investigated through the installation of staff gauges and measurement of static water levels in both shallow groundwater and surface water. The work plan for addressing this investigation is discussed in Section 5.3.

5.0 Data Gap-Analysis

There is sufficient evidence to confirm that a plume exists on-Site within the shallow groundwater adjacent to and downgradient of the Facility. The available groundwater quality data suggests that the plume consists of organics-related contaminants with elevated concentrations of ammonia. As part of the data assessment, CRA completed a data-gap analysis to identify areas where important information is unavailable concerning the contaminant nature, distribution or fate.

The following sections discuss the identified data gaps and outline the proposed action items for addressing the data gaps. Completing these action items forms the basis of the proposed work plan.

5.1 Surface Water Levels

As discussed previously, elevated ammonia concentrations within groundwater can be an issue of environmental concern when groundwater discharges to surface water, as the PWQO for un-ionized ammonia is low (0.02 mg/L). As such, it is important to understand whether or not shallow groundwater discharges to surface water at the Site to determine if the elevated ammonia concentrations are entering the surface water regime.

The comparison of shallow groundwater elevations with adjacent/nearby surface water elevations during quarterly monitoring events will determine whether or not groundwater is discharging to surface. As such, a series of staff gauges will be installed within the ditch along the north side of the Site (and any other on-Site surface water features, as appropriate). These staff gauges will be surveyed for geodetic reference. Surface water elevation measurements will then be incorporated into the monitoring program during each monitoring event. These measurements will be completed for a minimum of one year in order to observe the shallow groundwater - surface water relationship in different seasons.

Recommendations concerning the potential continuation of monitoring in the ditch will be made following one year of monitoring.

5.2 Complete Topographic Site Survey

It is understood that an as-built topographical survey of the site is unavailable. Accurate comparison of ground water levels to site grades is needed to verify if groundwater is discharging to the Site's surface water bodies. As such, an up to date topographical survey will be completed so this interface can be accurately assessed. The topographic survey will also be used to verify the pond levels and the outflow levels from the site into the Hawthorne Industrial Park.

5.3 Additional Monitoring Data

Groundwater

Although the current monitoring network has adequately identified the presence of an ammonia plume, the western extent of the contaminant plume along the northern Site boundary is currently unknown. Therefore, a shallow groundwater monitoring well will be installed to the west of MW5-09, as indicated on Figure 1 to better define the western extent of the plume. The proposed monitoring well will be incorporated into the regular monitoring program for quarterly sampling until sufficient data is gathered to warrant a monitoring reduction.

Surface Water

As discussed in Section 5.1, four (4) surface water staff gauges will be installed within the ditch along the north end of the Site in order to measure water levels within the ditch. The staff gauges will be geodetically surveyed so that measured water levels can be converted into static elevations. These static

elevations will be compared to the static groundwater elevations in adjacent groundwater monitoring wells to determine if shallow groundwater is discharging to this ditch. The proposed surface water staff gauge locations are illustrated on Figure 1.

5.4 Hydraulic Testing

In order to have a thorough understanding of the hydraulic characteristics of the shallow overburden and bedrock aquifers, additional testing of the aquifer properties will be completed along the northern Site boundary. This testing will be accomplished through single well response tests on the existing and proposed shallow groundwater monitoring wells in this area (MW5-09, MW102-09 and the proposed monitoring well).

The results of this testing will be used to better estimate the aquifer properties along the northern Site boundary.

6.0 Groundwater Remediation

In response to the identified groundwater plume, a single shallow groundwater extraction well will be installed near the ammonia scrubber. Based on the nature of the contaminants observed, the contaminant distribution and the interpreted source of leakage, the area immediately downgradient of the ammonia scrubber is considered the most suitable location for a remediation/extraction well.

The purpose of the extraction well will be to remove the most heavily impacted groundwater from the subsurface for use in the Facility process. Up to 15,000 L of groundwater can be used in the process daily. As such, this source removal strategy represents an ideal opportunity to control a significant portion of the plume without the need for treatment or trucking to a disposal facility.

7.0 Closing

It is anticipated that the installation of an additional monitoring well, a remediation/extraction well and establishment of surface water staff gauges will occur during the summer of 2014. The monitoring points will be incorporated into the regular monitoring program during the next regularly scheduled monitoring event.

The results of the above-described work program, including recommendations for next steps, will be provided to the MOE in a letter report following completion of the assessment.

We trust this to be complete and in order for your use. Should you have any questions, please do not hesitate to contact our office.
