- A minor drainage system of storm sewers and appurtenances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.

- One (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
1. Existing flows, pre-development (L/s)	206	351	606	848
2. Post-development flows (L/s)	1,118	1,651	2,410	3,067
3. Post-development attenuated flows (L/s)	56	89	189	283

The above, including erosion/sedimentation control measures during construction and all other controls and

appurtenances essential for the proper operation of the aforementioned *Works*.

Part II - Process Water Recirculation System

- A Process Water Recirculation System (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:
- Six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m³ each;
- Four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m³ respectively;
- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply
- Piping for percolate/washdown water supply to the composting area including a sprinkling system;
- An odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and
- Piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

2.2 EFFLUENT SUMMARY REPORT

What are the facility's effluent limits based on?
Certificate of Approval/Permit

Does the facility comply with its limits?
Yes

Condition 6 (5) speaks to the requirements for the Site to compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed Table 2 - Trigger Parameters outlined in the below table:

Table 2 - Trigger Parameters	
Parameter	**Trigger Level (mg/L if not specified)**
Ammonia (uniozized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100mL
pH	6.5 to 8.5
Temperature (maximum	23 ?C

At the time of the inspection the IO reviewed the comparison data for the 2011 operating year to ensure discharges were in compliance with Table 2 - Trigger Parameters. It was noted during the file review and inspection that the Site did not discharge the SWMP to the natural environment therefore sampling as per Table 2 - Trigger Parameters were not required.

2.3 SEWAGE TREATMENT WORKS CAPACITY ASSESSMENT

Flow (m^3/day)	Year 1	Year 2	Year 3
Average daily flow	0.00	0.00	0.00
Maximum daily flow	0.00	0.00	0.00
Capacity Design	0.00	0.00	0.00
% of capacity (based on average daily flow)	0.00	0.00	0.00

The ECA does not require flow measurement nor does it list any design capacity. In accordance with condition 6(12) the Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation. The owner is also required to maintain a log book to record the results of these inspections.

The IO requested the records regarding the annual inspection of the SWM Pond for the 2011 operating year. The review noted that the soil berm was completed as outlined in the previous Industrial Sewage Works Inspection Report and the SWMP inspections, completed by the Facility, and were recorded and available for review at the time of the inspection.

2.4 SAMPLING REQUIREMENTS

What are the facility's sampling requirements based on?

Certificate of Approval/Permit

Does the facility meet sampling requirements?

No

5. SURFACE WATER MONITORING AND RECORDING

(1) The *Owner* shall, upon commencement of operation of the *Works*, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analysed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganics**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate - N	Copper	
Nitrite - N	Lead	
Total Phenols	Mercury	
Total Phoshorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

Condition 5 of the ECA speaks to the requirements for monthly sampling of the SWMP. As part of the file review, the IO reviewed the 2011 Annual Report. Sampling data collected during the 2011 operating year was compared against Table 1 - Effluent Monitoring SMW Pond. The results of the comparison is outlined below:

- Samples were not collected during the months of January and February
- Nitrites were not analysed for the month of April, May, August, September, October and December
- Nitrates were not analysed for the month of May and October
- BOD5 was not sampled for the months of November & December
- Chemical oxygen Demand was not analysed for the month of May and October
- Conductivity was not analysed for the months of March, April, May, June, July, August and October
- pH was not analysed for the months of April and May.
- Temperature was not analysed for the sampling program in 2011.
- Dissolved oxygen was not analysed for the months of March, April, May, June, July, August, September, October and November
- The parameter "Oil & Grease" was not analysed as a total but rather only for vegetable and animal products during the months of March, April, May, June, August, September, October, November and December

Please see Section 5.0 of this Report**

9. GROUNDWATER MONITORING

Upon issuance of this *Certificate,* the *Owner* shall establish the following groundwater monitoring program with monitoring wells located as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates.

1) For the unconfined shallow groundwater aquifer, the *Owner* shall establish and maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing eight (8) monitoring wells designated as: MW1-08 to MW5-08; and MW101 to MW103 and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

2) For the confined deep bedrock aquifer, the *Owner* shall maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing three (3) monitoring wells designated as: TW-4, TW-7, and TW-8 (within the Orgaworld Canada Ltd. site), and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

4) The *Owner* shall collect groundwater samples twice per year - in May and November - from the

monitoring wells listed at subsections (1) and (2), and increase the sampling frequency to four times per year - in February, May, August and November - for the three new wells MW101, MW102, and MW103.

The Facility has currently completed the groundwater monitoring for the 2011 & 2012 operating year. A copy of the 2012 report will be provided to the Ottawa District in March 2013 and will be reviewed by the ministry's Technical Support Section for comments.

2.5 REPORTING REQUIREMENTS

What are the facility's reporting requirements based on?
Certificate of Approval/Permit

Does the facility meet reporting requirements?
Yes

Condition 10 of the said ECA -ISW outlines specific reporting requirements that must be completed by the Facility.

10. REPORTING

3) The *Owner* shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the *Works* and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works;*

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the *District Manager* requires from time to time.

In March 2012, the Company submitted the 2011 Annual Report as per the requirement under Condition 10 (3). As part of the inspection process, the 2011 Annual Report (Report) was reviewed for completeness and compliance with the above referenced condition.

Findings:

- Remediation works were completed on the berm (spring of 2011). No addition operating problems were encountered requiring corrective actions to be taken.
- No maintenance was carried out on any major structure, equipment, apparatus, mechanics, or think forming part of the Works (not including the remediation of the berm)
- No leachate contaminated sewage was hauled to a municipal sewage treatment plant during the 2011 operating year.
- No calibration or maintenance of effluent monitoring equipment was completed in the 2011 operating year as the

pond level reading device does not require calibration.
- The groundwater/surface water monitoring and compliance report will be submitted in March of 2013 (being prepared by Conestoga-Rovers & Associates)
- Effluent Monitoring Results - Appendix 1 - the results from the effluent monitoring comparison is outlined in Section 2.4 of this Report

---

As part of the reporting requirements for the Facility, the Site must also comply with Condition 6 & 7 of the ECA-ISW regarding Operating and Maintenance of the industrial sewage works systems.

Condition 6 & 7 - Operation and Maintenance

The ECA requires the Facility to develop and implement Operation and Maintenance Manuals for the two sections of the SWMP (Part II - Stormwater Management Works & Part III - Process Water Recirculation System). At the time of the inspection and as part of the file review, the IO requested to review the Operation and Maintenance Manuals for the Industrial Sewage Works System.

- Operation and Maintenance Manuals for the Industrial Sewage Works System was implemented as required
- A Spill Contingency and Pollution Prevention Plan was developed, implemented, and submitted to the ministry
- The Facility has operating procedures in place for routine operation of the industrial sewage works system
- The Facility has logbooks for recording inspection findings, maintenance activities, and/or repairs
- The Facility has also developed and implemented a complaint recording and responding procedures in the event an environmental complaint is received by a member of the public.

Note: At the time of the inspection the IO requested records of any environmental complaint received as a result of the operations at the Site. Facility representative stated that no complaints were received.

2.6 FLOW MEASUREMENT

Flow measurements are not required in the ECA.

2.7 MINISTRY SAMPLE RESULTS

Were Ministry samples collected during the inspection?
No

Reason:
At the time of the inspection no Ministry of the Environment samples were collected as the industrial sewage works system was not discharging to the natural environment.

2.8 FINANCIAL ASSURANCE

The facility holds financial assurance in accordance with Waste ECA #2766-7HEPSZ.

2.9 SPILL PREVENTION AND CONTINGENCY PLANS

Is the facility required to have a Spill Prevention and Contingency Plan (SPCP) as required by Ontario Regulation 224/07?
No

Has the facility had any spills since the last inspection?
No

Were all the spills reported to the ministry?
N/A

Does the facility's operations or spill history suggest that a SPCP be developed?
No

Comments:

As referenced in Section of this Report, the Facility has developed, implemented and provided a copy of the Site's Spill Contingency and Pollution Prevention Plan. No spills were reported to the ministry's Ottawa District Office or the Spills Action Centre.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

No remaining non-compliance issues were identified during the file review prior to the completion of this inspection report.

4.0 SUMMARY OF INSPECTION FINDINGS

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment?
Yes

Specifics:

1.) The Site has failed to ensure all parameters outlined in Table 1 - Effluent Monitoring SWM Pond were sampled for each month.

2.) The Site has failed to ensure all monthly samples were collected for the 2011 operating year.

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material?
No

Specifics:

Was there any indication of minor administrative non-compliance?
Yes

Specifics:

5.0 ACTION(S) REQUIRED

The following action items require addressing by the Facility and must be implemented upon receiving this Report:

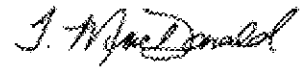
1.) Ensure samples are collected on a monthly basis as required by ***Condition 5 - Surface Water Monitoring and Recording***

2.) Ensure monthly samples are analysed for the parameters outlined in ***Table 1 - Effluent Monitoring SWM Pond***

1. 1.) Ensure samples are collected on a monthly basis as required by Condition 5 - Surface Water Monitoring and Recording
2. 2.) Ensure monthly samples are analysed for the parameters outlined in Table 1 - Effluent Monitoring SWM Pond

6.0 OTHER INSPECTION FINDINGS

None at this time.



7.0 INCIDENT REPORT

1.0 INTRODUCTION

Orgaworld Canada Ltd. (the "Facility") is an aerobic composting facility that is approved to accept solid non-hazardous organic waste, as defined in their waste Environmental Compliance Approval No. 2766-7HEPSZ (ECA), for the production of compost. The organic waste is brought to the site located at 5123 Hawthorne Road in the City of Ottawa (the "Site"), shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Once the material remains in the tunnels long enough for the temperature to reach 55 degrees Celsius for 3 consecutive days it is cooled down, removed from the tunnels and placed into a screener which separates the material in size fractions. The screener separates the material into 20+ (which includes large pieces of material that have not composted), 12-20 material (which is medium sized material), incidental waste, and compost. The 20+ material is used as inoculate and mixed in with fresh material in the Mixing Hall, or further shredded and run through the screener again. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the certificate of approval and then removed from the site as finished compost. It should be noted that the material sized as 12-20 is also referred to as "10-100" material as that was the original screen size.

Orgaworld Canada Ltd. first started accepting organic material at their Site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa is currently collecting the leaf and yard waste commingled with the SSO waste. It should be noted that the City of Ottawa started commingling their leaf and yard waste with the SSO organics and sending it to Orgaworld in April 2010.

The purpose of the inspection is to assess the Site's compliance with their waste ECA and applicable environmental legislation such as the Environmental Protection Act (EPA) and Ontario Regulation 347 under that same act. The inspection consisted of a district file review, site visit and discussions with Greg Mariotti, Site Manager and Michael

Rooke, Compliance Officer.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff throughout the year.

An Air Facility Inspection and an Industrial Sewage Inspection were also carried out at the site. See respective reports for details.

2.0 INSPECTION OBSERVATIONS

Certificate of Approval Number(s): ● Yes ○ No
C of A Number(s):

ECA No. 2766-7HEPSZ - Issued on September 16, 2009

Notice 1 - Issued on October 21, 2010
Details: The amendment was issued to allow the Facility to operate a mobile shredder unit on-site.

Notice 2 - Issued on May 2, 2012
Details: The amendment was issued for a change to allow the Facility to receive and remove waste between the hours of 6am to 8pm (M-F) and between the hours of 7am to 8pm on Saturdays - Condition 5.1

2.1 SITE OPERATION:

Specifics:

2. SERVICE AREA, APPROVED WASTE TYPES, RATES & STORAGE

(1) The Site may only accept solid non-hazardous domestic, commercial, institutional or industrial Organic Waste from the Provinces of Ontario and Quebec, limited to the following Organic Waste:

(a) Source-separated Organic Waste limited to the following:
(i) Food wastes: fruit, vegetable and general table scraps, meat and fish products, dairy products, egg shells, confectionery products, sauces, bones, pet food, fat, bread and grains, rice, pasta, coffee grounds, filters;
(ii) Paper fibres: soiled paper towels, tissues, paper plates, soiled paper food packaging items such as boxboard, cardboard, newspaper, and other packaging materials;
(iii) Miscellaneous: houseplants and yard wastes, dryer lint and hair, pet fur, sawdust and wood shavings and litter or bedding.
(b) Organic Waste from the food processing industry and other industries that produce food wastes;
(c) Organic Waste from the commercial sector, including but not be limited to food waste from restaurants, hotels, institutions, commercial operations that collect organic wastes;
(d) Leaf & yard waste;
(e) Organic sludges, including but not be limited to starches and paper wastes, but excluding sewage sludge and biosolids.

The 2011 Annual Report (2011 AR) states that the Facility is in compliance with Condition 2.(1) by only accepting waste from the City of Ottawa.

(2) (i)The Owner shall not accept at the Site sanitary products and human body waste.
(ii) The Owner shall not accept at the Site any waste that is collected through a waste collection program that allows use of plastic bags.
(iii) The Owner shall not accept at the Site any waste that is classified as hazardous waste or liquid industrial waste in accordance with *O. Reg. 347* .

The 2011 AR states that the Facility is in compliance with the above referenced condition by not accepting sanitary products, human body waste, plastic bags, hazardous waste and liquid industrial waste as defined in Ontario Regulation 347.

(3) The Owner is only approved to receive Organic Waste in quantities that are not to exceed:

(a) a maximum of 1,200 tonnes on a daily basis; and
(b) a maximum of 150,000 tonnes per year.

The 2011 AR provided the monthly and annual tonnages for the 2011 operating year. The data provided in the report confirms the Facility is in compliance with tonnage limits.

(4) The Owner is approved to store the following amounts of waste at the Site:
(a) unprocessed Organic Waste stored within the Processing Building awaiting processing shall not exceed 3,000 tonnes;
(b) leaf & yard waste stored at the Site shall not exceed 1,500 tonnes;
(c) Organic Waste, including leaf & yard waste and biofilter medium waste, undergoing Composting in the composting tunnels shall not exceed 5,040 tonnes;
(d) Immature Compost in various stages of curing shall not exceed 10,000 tonnes;
(e) Residual Waste and Rejected Waste shall not exceed 1,000 tonnes.

The 2011 AR states that in the 2011 operating year the Facility was in compliance with the approved waste storage amounts outlined in this condition.

(5) Waste storage at the Site is subject to the following limitations:

(a) unprocessed Organic Waste, excluding leaf & yard waste, shall be stored within the confines of the Processing Building;
(b) leaf & yard waste shall be stored within the confines of the Processing Building, or in accordance with the requirements of Condition 6.(14) of the Certificate of Approval (Industrial Sewage) for this Site;
(c) Immature Compost in various stages of curing shall be stored within the confines of the Processing Building;
(d) solid Residual Waste shall be stored in lugger bins located within the confines of the Processing Building;
(e) solid putrescible waste generated through activities not relating to the handling and processing of Organic Waste (ie. office, lunch room, etc.) may be stored in a covered bin outdoors and it shall be removed from the Site as required in accordance with *O. Reg 347* and the *EPA* .

At the time of the inspection no waste was observed to be stored outside the Processing Building. All waste and phases of compost were located inside the confines of the Processing Building.

(6)Organic Waste storage duration is limited to the following:
(a) The maximum storage duration of the leaf & yard waste shall not exceed thirty (30) days from the time of its receipt.
(b) The maximum storage duration of the purchased wood amendment materials shall not exceed ninety (90) days from the time of their receipt.

(c) The maximum storage duration of the Organic Waste within the Processing Building prior to loading into the aerated composting tunnels shall not exceed the time period that is required to accumulate enough Organic Waste to fill one (1) composting tunnel.

(d) The Owner shall not store the Residual Waste at the Site in excess of thirty (30) days from the date of its generation, or as directed by the District Manager.

(e) If in the opinion of the District Manager, the duration of waste storage from (a) and/or (b) and/or (d), above, results in odour complaint(s), the Owner, in consultation with the District Manager shall undertake appropriate steps, including reducing waste storage duration, so that odour complaint(s) are eliminated.

The 2011 AR states that the storage duration of the leaf & yard waste, purchased wood amendment materials, organic waste within the Processing Building and Residual waste did not exceed the storage duration limits as outlined by the above condition.

(7) No outside waste storage other than that described in Condition (5), above, is approved under this Certificate.

At the time of the inspection it was noted that waste was not being stored outside other than that described in Condition (5).

(8) The Company shall ensure that all waste storage is undertaken in a manner that does not cause an adverse effect or a hazard to the environment or any person.

At the time of the inspection the IO was informed that no environmental impacts or complaints were received as result of the composting operation at the Site.

(9) In the event that Organic Waste cannot be processed at the Site and the Site is at its approved waste storage capacity, the Owner shall cease accepting additional Organic Waste. Receipt of additional Organic Waste may be resumed once such receipt complies with the waste storage limits approved in this Certificate.

The 2011 AR stated compliance with the above reference condition.

(10) All waste removed from the Site for final disposal shall only be disposed of at a site for which a Provisional Certificate of Approval has been issued by the Ministry and the site is approved to receive this type and quantity of waste.

The 2011 AR stated that all outgoing waste was sent to ministry approved waste disposal sites. The following are the waste disposal sites where waste was sent to in the 2011 operating year:
- Lacombe Environmental Services operating under ECA No. A461303
- City of Ottawa Trail Road Landfill operating under ECA No. A460716

3. SIGNS

(1) Prior to receipt of waste at the Site, the Owner shall ensure that a sign is posted at the entrance to the Site. The sign shall be visible from the main road leading to the Site. The following information shall be included on the sign:

(a) name of the Owner;
(b) this Certificate number;
(c) hours during which the Site is open;
(d) waste types that are approved to be accepted at the Site;
(e) Owner's telephone number (a hotline) to which complaints may be directed;
(f) Owner's twenty-four hour emergency telephone number (if different from above);
(g) a warning against unauthorized access;
(h) a warning against dumping at the Site.

(2) The Owner shall ensure that appropriate signs are posted at the Site clearly identifying the waste and stating warnings about the nature of the waste and any possible hazards.

At the time of the inspection it was noted that the Facility has complied with Condition 3 of the issued ECA by posting a sign at the entrance of the Site outlining the above required information from a-h. No issues were identified with this information.

4. SITE SECURITY

(1) All unloading and loading of waste and all waste processing activities at the Site shall at all times be undertaken by Trained Personnel.

At the time of the inspection the IO requested training logs for the staff that work at the Facility. Training logs were provided to the IO. As part of the training program at the Facility it is required that staff be trained on conditions outlined in the environmental compliance approvals for the Site.

(2) The Owner shall ensure that access to the Site is regulated and that all entrances are secured by lockable gates to restrict access only to authorized personnel when the Site is not open.

At the time of the inspection it was observed that the Site has installed a fence with a lockable gate to restrict access to

the Site.

6. EQUIPMENT AND SITE INSPECTIONS & MAINTENANCE

(1) **Prior to receipt of any waste at the Site, the Owner shall prepare a comprehensive written inspection program which includes inspections of all aspects of the Site's operations including the following:**

(a) **loading/unloading area of the leaf & yard waste storage pad;**
(b) **parking lot area for evidence of run-off from the leaf & yard waste storage pad;**
(c) **Processing Building and the air pollution control equipment;**
(d) **security fence and property line;**
(e) **on-site roads for presence of leaks and drips from the waste delivery trucks;**
(f) **presence of excessive fugitive dust emissions from the on-site roads or the Compost stockpiles;**
(g) **on and off-site litter;**
(h) **presence of vector and vermin.**

At the time of the inspection the IO requested documents and procedures which speaks to the Facility's inspection program. The Facility provided the procedures which address the above condition. The IO also reviewed procedures located in the district file which speaks to maintenance and inspections of the pollution control devices and industrial sewage works system.

(2) **The inspections are to be undertaken daily by Trained Personnel in accordance with the inspection program to ensure that all equipment and facilities at the Site are maintained in good working order at all times and that no off Site impacts are occurring. Any deficiencies detected during these regular inspections must be promptly corrected.**

At the time of the inspection the IO requested training logs for the staff that work at the Facility. Training logs were provided to the IO. As part of the training program at the Facility it is required that staff be trained on conditions outlined in the environmental compliance approvals for the Site.

The Facility also noted in the 2011 AR that no deficiencies were encountered in that operating year.

(3) **The Owner shall develop and implement a preventative maintenance program for all on-Site equipment associated with the processing and managing of waste and control of odour and dust emissions. The preventative maintenance program shall be maintained up-to-date and shall be available for inspection by a Provincial Officer upon request.**

A copy of the preventative maintenance program was provided to the Ottawa District Office and was reviewed during the district file review prior to completing the inspection.

8. NUISANCE IMPACT CONTROL & HOUSEKEEPING

(1) **The Owner shall ensure that all vehicles that have delivered waste to the Site are not leaking or dripping waste when leaving the Site.**

At the time of the inspection a City of Ottawa collection vehicle arrived at the Site. The vehicle appeared not to be leaking nor dripping waste. Upon leaving the Site, no evidence of waste was observed at the exit gate of the Site.

(2) **The Owner shall ensure that the exterior of all trucks delivering waste to the Site is cleaned prior to leaving the Site, as needed, to prevent odours. Truck washing shall occur only in the dedicated wash down area of the processing building.**

At the time of the inspection no truck washing operations were occurring. The City of Ottawa vehicle appear to be recently cleaned and odours could not be detected.

(3) **The Owner shall ensure that there is no queuing or parking of vehicles that are waiting to enter the Site on any roadway that is not a distinct part of the Site.**

At the time of the inspection no vehicles entering the Facility were parked or queuing on roads outside the Site boundary.

(4) Should the Owner become aware that the truck(s) delivering waste to the Site have leaked wastewater on the municipal roadways, the Owner shall immediately notify the owner of the leaking vehicle(s) and the District Manager about the leak problem.

Prior to the inspection, a district file review was completed and the District Manager had not been notified of any wastewater impacts to municipal roadways.

(5) The Owner shall:
(a) take all practical steps to prevent the escape of litter from the Site;
(b) pick up litter around the Site on a daily basis, or more frequently if necessary; and
(c) if necessary, erect litter fences around the areas causing a litter problem.

At the time of the inspection the IO walked a portion of the property and observed no litter issues.

(6) Prior to the receipt of any waste at the Site, the Owner shall:
(a) implement necessary housekeeping procedures to eliminate sources of attraction for vermin and vectors; and
(b) hire a qualified, licensed pest control professional to design and implement a pest control plan for the Site. The pest control plan shall remain in place, and be updated from time to time as necessary, until the Site has been closed and this Certificate has been revoked.

At the time of the inspection the IO requested procedures and records of vermin and vector control. The IO was informed that the Facility retains the services of Holistech and conducts monthly site visits so the Facility can control vermin and vector.

(7) The Owner shall ensure that all on-Site roads and operations/yard areas are regularly swept/washed to prevent dust impacts off-Site.

At the time of the inspection the entrance, roads on-site, and exit were clear with no signs of dust impacts. The Facility retains a company to clean of the asphalt parking area if and when it is required.

(8) (i) The Owner shall store Compost within the confines of the Processing Building, or in accordance with the requirements of Condition 6.(14) of the Certificate of Approval (Industrial Sewage) for this Site.

At the time of the inspection the IO observed compost to be stored within the confines of the Processing Building.

(ii) Notwithstanding the requirements of Condition 8.(8)(i), above, the Owner shall ensure that the Compost stockpiles are not a source of fugitive dust emissions. If the proposed Compost storage features are deemed insufficient to control the fugitive dust emissions from the Compost stockpiles, the Owner shall provide additional covers or spray the stockpiles with water, or use any other method to minimize the fugitive dust emissions.

At the time of the inspection dust was assessed to determine if the operations and procedures currently in place are effectively controlling fugitive dust. It was noted that fugitive dust was being significantly control as no dust was observed.

9. <u>OPERATIONS MANUAL & STAFF TRAINING</u>

(1) The Owner shall prepare an Operations Manual for use by the Site personnel. The Operations Manual shall contain the following:

(a) outline the responsibilities of the Site personnel;
(b) personnel training protocols;
(c) waste receiving and screening procedures;
(d) unloading, handling and storage procedures;

(e) waste processing procedures;
(f) sampling and testing procedures;
(g) Site inspections and recording procedures;
(h) the emergency response procedures;
(i) procedure for handling complaints as described in the Certificate of Approval (Air/Noise) for this Site.

At the time of the inspection the IO requested procedures and manuals as required by the above referenced condition. The Operations Manual developed by the Facility outlines the all the requirements of this condition. A copy of the manual was also available during the district file review.

(2) A copy of this Operations Manual shall be kept at the Site, must be accessible to personnel at all times and must be updated, as required.

(3) (a) All operators of the Site shall be trained with respect to the following:

(i) terms, conditions and operating requirements of this Certificate;
(ii) operation and management of the Site, or area(s) within the Site, as per the specific job requirements of each individual operator, and which may include procedures for receiving, screening and identifying waste, refusal, handling, processing and temporarily storing wastes;
(iii) an outline of the responsibilities of Site personnel including roles and responsibilities during emergency situations;
(iv) the Emergency Response and Contingency Plan including exit locations and evacuation routing, and location of relevant equipment available for emergency situations;
(v) environmental, and occupational health and safety concerns pertaining to the wastes to be handled;
(vi) emergency first-aid information;
(vii) relevant waste management legislation and regulations, including the *EPA* and *O. Reg. 347* ;
(viii) recording procedures as required by this Certificate;
(ix) equipment and site inspection procedures, as required by this Certificate;
(x) nuisance impact control & housekeeping procedures, as required by this Certificate; and
(xi) procedures for recording and responding to public complaints as required by the Certificate of Approval (Air/Noise) for this Site.

At the time of the inspection the IO reviewed a training program for one (1) of the staff at the Facility. The training program reviewed addresses the requirements of this condition. All training programs for staff are kept electronically.

10. <u>EMERGENCY RESPONSE AND CONTINGENCY PLAN</u>

(1) Within six (6) months from the date of this Certificate, the Company shall submit to the District Manager an Emergency Response and Contingency Plan. The Emergency Response and Contingency Plan shall be prepared in consultation with the District Manager, the local Municipality and the Fire Department and as a minimum it shall include the following information:

(a) emergency response procedures to be undertaken in the event of a spill, process upset, power failure, fire or any other emergency situation, including specific clean up methods for wastes expected to be generated from the emergency situation;
(b) a list of equipment and clean up materials available for dealing with the emergency situations;
(c) notification protocol with names and telephone numbers of persons to be contacted, including persons responsible for the Site, the Ministry's District Office and Spills Action Centre, the local Fire Department, the local Municipality, the local Medical Officer of Health, and the Ministry of Labour, and the names and telephone numbers of waste management companies available for emergency response;
(d) procedures and actions to be taken should the incoming Organic Waste not meet the quality criteria specified by this Certificate;
(e) procedures and actions to be taken should the outgoing Residual Waste not meet the quality criteria required by the specified by this Certificate;
(f) procedures and actions to be taken should the composted Organic Waste fail to meet the compost quality criteria specified by the Certificate;
(g) procedures and actions to be taken should the occurrence of the complaints require the Company to suspend the waste processing activities at the Site.

At the time of the file review prior to the inspection, the IO reviewed the "Contingency Plan for Odours, Spills,

Fires, Power Failures and Labour Disruptions" procedure. A copy of the procedure will remain on file at the district office.

12. RECORDS KEEPING

Annual Report

(9) By March 31st following the end of each operating year, the Owner shall prepare and submit to the District Manager and the Public Liaison Committee (PLC), an Annual Report summarizing the operation of the Site covering the previous calendar year. This Annual Report shall include, as a minimum, the following information:

(a) a monthly mass balance of the Organic Waste received, processed and transferred from this Site, including waste type, quantity, sources and/or disposal destinations;
(b) an annual summary mass balance of the Organic Waste received, processed and transferred from this Site, including waste type, quantity, sources and/or disposal destination;
(c) an annual summary of any deficiencies, items of non-compliance or process aberrations that occurred at this Site and any remedial/mitigative action taken to correct them;
(d) a descriptive summary of any spills, incidents or other emergency situations which have occurred at this Site, any remedial measures taken, and the measures taken to prevent future occurrences;
(e) a summary describing any Rejected Waste including quantity, waste type, reasons for rejection and origin of the Rejected Waste;
(f) any environmental and operational problems, that could negatively impact the environment, encountered during the operation of the Site or identified during the facility inspections and any mitigative actions taken;
(g) any changes to the Emergency Response and Contingency Plan, the Operations Manual or the Closure Plan that have been approved by the Director since the last Annual Report;
(h) any recommendations to minimize environmental impacts from the operation of the Site and to improve Site operations and monitoring programs in this regard;
(i) a summary of any complaints received and the responses made, as required by the Certificate of Approval (Air/Noise);
(j) an update on the amount of Financial Assurance which has been provided to the Director;
(k) update on activities of the PLC;
(l) a condition-by-condition analysis of compliance with all Conditions of this Certificate.

As part of the file review process the AR was found to be complete as required. The AR was submitted to the Ottawa District Office in March of 2012.

2.2 FINANCIAL ASSURANCE:

Specifics:

Financial assurance has been submitted by the Facility.

2.3 SITE SERVICE AREA:

Specifics:

In accordance with Condition 2(1) the Site may only accept solid non -hazardous domestic, commercial, institutional or industrial Organic waste for the Province of Ontario and Quebec limited to the Organic Waste listed in Condition 2 of the Approval.

The Facility is currently only accepting organic waste and leaf and yard waste for the City of Ottawa waste collection program.

2.4 APPROVED SITE CAPACITY:

Specifics:

The Site is approved for the following:

" a 10.12-hectare Waste Disposal Site (Processing) serving the Provinces of Ontario and Quebec, for the temporary storage, transfer and processing (composting) of solid non-hazardous, domestic, commercial, institutional or industrial organic waste at a maximum rate of 1,200 tonnes per day and 150,000 tonnes per year of Organic Waste..."

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

No ongoing non-compliance issues were identified during the file review process.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?
No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?
No

Specifics:

Was there any indication of minor administrative non-compliance?
No

Specifics:

5.0 ACTION(S) REQUIRED

No actions are required by Orgaworld Canada Inc.

1.0 INTRODUCTION

Orgaworld Canada Ltd. (referred to as the "Facility"), located at 5123 Hawthorne Road in the City of Ottawa (the "Site), is an aerobic composting facility that is approved to accept solid non-hazardous organic waste as defined in their waste Environmental Compliance Approval for the production of compost. Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the waste certificate of approval and then removed from the site as finished compost. All process air and air from the receiving hall is directed through pollution control equipment. Leachate generated as a result of the composting process gets recirculated, any excess is kept in on-site storage tanks.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa has been collecting the leaf and yard waste commingled with the SSO waste.

The Facility is approved to operate at a production limit of up to 150,000 tonnes per year of organic waste.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. The site visit for the inspection was conducted on December 19th, 2012.

The purpose of this inspection is to assess compliance with the Site's Air Facility Environmental Compliance Approval # 7021-7HQNDE (" ECA") and applicable environmental legislation such as the Environmental Protection Act ("EPA") and Ontario Regulation 419/05. The inspection consisted of a district file review, site visit and discussions with Greg Mariotti, site operations manager and Michael Rooke, Compliance Officer.

An Industrial Sewage Works inspection and non -hazardous waste transfer processing inspection were also carried out at the site. See respective reports for details

1.1 FOCUS OF THE AIR INSPECTION

Is the inspection for the entire facility or is it scoped to part of the facility?

● Entire Facility ○ Part of the Facility

Specifics:

The Air Facility Inspection focused on compliance with the issued ECA which includes all pollution control devices and related performance limits, documentation, reporting, operation/maintenance, complaints recording procedures, and record keeping requirements.

The Facility was issued a Limited Flexibility Environmental Compliance Approval (ECA # 7021-7HQNDE) on September 16, 2009. The inspection will be focused on information and data collected during the 2011 operating year.

1.2 TARGET SECTOR IN ONTARIO REGULATION 419/05, AIR POLLUTION - LOCAL AIR QUALITY

Is the facility in a targeted sector identified in Schedule 4 or Schedule 5 of O. Reg. 419/05?

No, the facility is not in a target sector identified in Schedule 4 or Schedule 5.

Specifics:

2.0 INSPECTION OBSERVATIONS

Specifics:

At the time of the inspection Orgaworld staff provided a tour to the IO which incorporated a detailed overview of the air pollution control devices that treat the emission generated as a result of the composting operations. The Site has several pollution control devices in series to ensure proper treatment of emissions. The system is described below:

1.) Fans are located throughout the building, these fans suck air from the building to the pollution control equipment which creates a negative pressure environment within the building. Air from the building and air from the composting tunnels goes through an ammonia scrubber, then one of two biofilters, then a bioscrubber, then the 40 meter stack.

The Facility continuously monitors the process by a SCADA system. This system is remotely accessed to allow the Facility to adjust the system as required. The system uses sensors to monitor parameters such as water content, air temperature, oxygen content, air pressure, and air flow. When the levels being monitored go outside of the preprogrammed acceptable range then an alarm is triggered and a message is sent to the phones of the staff personnel who have the ability to monitor the situation off-site. The SCADA system gives details of operating parameters in each compost tunnel, in the ammonia scrubber, biofilters, bioscrubber and stack.

Ammonia scrubber:

The sulphuric acid tank is located outside the building. The ammonia scrubber circulates a sulphuric acid solution over a media to scrub ammonia from the air into solution. When the ammonia scrubber gets saturated (pH gets too high) it is replaced. The waste ammonia sulfate gets transferred into one of the leachate tanks on site.

The incoming waste composition in Ottawa is such that the material has been very dry, the Facility operates in a water negative environment in the summer and as such leachate generated in the operation of the Facility gets re-circulated within the process. If the Facility needs to bring in extra water they take it from the stormwater management pond on-site.

There are several odour ports throughout the Facility.

Biofilter:

At the time of inspection the Facility was operating two biofilters. According to the supporting documentation for the application, the biofilter media needs to be replaced every 6 months to a year. The media was last replaced November 25, 2012. The waste media from the biofilter is introduced into the composting process of the Facility.

Bioscrubber:

This is the final step before the stack. According to staff water needs to be added to the bioscrubber every 2 to 3 days. At the bottom of the bioscrubber there should be 50-55 cm of water, an alarm goes off if the levels drop bellow 40 cm.

Stack:

The stack is 40 meters high, there is a sampling port placed outside at the bottom of the stack in order to sample air right before it goes into the stack. There is also a sampling port inside just after the bioscrubber.

2.1 SITE CONDITIONS

Operating
Specifics:

The following site conditions were noted during the time of the inspection:

Noise: At the time of the inspection noise was assessed to determine if the operation of the Facility is generating noise levels which could have potential impacts off-site. It was noted during the inspection that noise levels, both inside and out, did not pose an impact off-site.

Dust: At the time of the inspection dust was assessed to determine if the operations at the Facility (truck traffic, unloading/loading of materials, etc) is causing impacts off-site. It was noted during the inspection that dust did not appear to be generated resulting in no potential off-site impacts.

Odour: Prior to arriving at the Site to conduct this inspection, the IO observed the stack and wind direction to determine if emission from the stack (odours) could be detected downwind of the Facility. Several survey points were visited however no odours were detected downwind.

Odours were also revisited when the IO was completing the Site visit with Facility staff. No odours generated inside the Facility migrated out of the building. This could be due to the Facility operating in a negative pressure system.

After completing the inspection the IO completed a second odour survey downwind of the Facility. It was

noted that odours did not seem to be migrating off-site.

Vibration: At the time of the inspection vibration was assessed to determine if the operation of the Facility is generating vibration levels which could have adverse impacts to surrounding properties. It was noted during the inspection that vibration levels, both inside and out, did not pose a risk to surrounding properties.

2.2 AUTHORIZING, CONTROL AND REGISTRATION DOCUMENTATION FOR AIR/NOISE EMISSIONS

Does the facility have authorizing, control and/or registration documents applicable to this inspection?

● Yes ○ No

Specifics:

Type of Document	Number	Date	Limit*	Notes
Environmental Compliance Approval - Comprehensive	7021-7HQNDE	2009/09/16		

*** Limit in Document**

2.3 EQUIPMENT REQUIRING AUTHORIZING DOCUMENT

Does the facility have the required Environmental Compliance Approval(s)?

If you own, manage or operate a facility with an operation or equipment that emits one or more contaminants into the air as noted under section 9 of the Environmental Protection Act, you are required to have and operate under an Environmental Compliance Approval unless the activity is exempted from the approval process or is eligible for the Environmental Activity and Sector Registry (EASR).

The Environmental Compliance Approval (ECA) replaces the previous Certificate of Approval (Air) commencing October 31, 2011. All existing Certificates of Approval (Air) and their conditions continue to apply. Application for a new Environmental Compliance Approval is needed when you intend to make a change that requires an amendment to the approval.

☐ The facility does not have any required approval(s) for discharge of contaminants to air.
☐ The facility requires an amendment or additional approval for discharge of contaminants to air.
☐ The facility requires an amendment or additional approval for activity(s) other than for discharge of contaminants to air.
☒ The facility has the required approval (s) for discharge of contaminants to air (or is not required to obtain them).

Specifics:

On September 16, 2009, the Facility was issued a Comprehensive Environmental Compliance Approval No. 7021-7HQNDE for the operation of the equipment that emits contaminants into the natural environment. The equipment approved under the ECA does not meet the requirements of the Environmental Activity Sector Registry.

The comprehensive environmental compliance approvals allow companies to make changes to their equipment which discharge contaminants to the natural environment. As part of the approval structure, when changes are made, the Facility must model the emissions to ensure compliance with applicable standards and limits outlined in the approval and Ontario Regulation 419/05. Also, as part of the comprehensive approval, the Facility must submit an annual report outlining operations in the reporting operating year.

2.4 LEGISLATIVE NOTIFICATION REQUIREMENTS

Has the facility met all applicable legislative notification requirements for air emissions?

● Yes ○ No ○ Not Required

Specifics:

2.5 MONITORING AND REPORTING

Has the facility met its assessment requirements?

● Yes ○ No ○ Not Required

Specifics:

As per Condition 10.1, the company is required to conduct source testing every six (6) months after the start-up date and every (6) months thereafter. The start-up date was January 28th, 2010.

Previous source testing events were completed on:
June 2010
December 2010
July 2011
December 2011
November 2012

On February 3, 2011 the Facility requested an amendment to reduce the frequency of source testing per year from every six (6) months to once a year as well as the removal of hydrogen sulfide and mercaptons from the testing parameters. On May 17, 2012 the Facility was granted permission to reduce the source testing requirements. The last source test was completed in November of 2012.

A report on the outcome of the source testing was provided to the ministry on January 3, 2013 and is currently under review. Comments will be provided to the Facility once complete.

The next source testing is scheduled for November 2013.

Has the facility met its reporting requirements?

● Yes ○ No ○ Not Required

Specifics:

On May 28, 2012 the Facility submitted the Written Summary Report for the 2011 operating year (electronic submission)

2.6 EXCEEDANCE OF A LEGAL LIMIT AND/OR GUIDELINE

Is there information that demonstrates an exceedance of a legal limit and/or guideline for air emissions?

○ Yes ● No

Specifics:

Annual Report:

Condition 5 of the ECA requires the Facility to submit a Written Summary Report of activities undertaken in the previous calendar year by May 31 of each year. On May 28, 2012 the Written Summary Report for the 2011 operating years was submitted electronically to the ministry.

The report states that no modifications were made in the 2011 operating year.

2.7 OPERATIONAL AND MAINTENANCE REQUIREMENTS

Has the facility met its operating/maintenance requirements?

● Yes ○ No ○ Not Required

Specifics:

As part of the inspection process, the Inspecting Officer (IO) requested the Operational & Maintenance Manuals as required by the issued ECA.

The following documents were available at the time of the inspection:

- Contingency Plan for Odours, Spills, Fires, Power Failures and Labour Disruptions *(Orgaworld Ltd. - January 2010 - Conestoga-Rovers & Associates)*
- Site Inspection and Monitoring Program *(Orgaworld Ltd. - January 2010 - Conestoga-Rovers & Associates)*
- Operations Manual *(Orgaworld Ltd. - October 2009 - Conestoga-Rovers & Associates)*
- Odour Monitoring Program *(Orgaworld Ltd. - October 2009 - Conestoga Rovers & Associates)*

2.8 RECORD KEEPING REQUIREMENTS

Has the facility met its record keeping requirements?

● Yes ○ No ○ Not Required

Specifics:

Maintenance:

A maintenance schedule and inventory list is kept on site. Maintenance work orders are generated as needed and inspection log sheets are filled out by staff. All paperwork is kept in binders on site and overviewed by the site manager.

Environmental Complaints:

The Facility has developed a document to address any complaint received as a result of the Site's operation. The document outlines the keystone information needed to record details of the complaint as well as follow-up actions taken to address the problem. The Facility records these complaints in a binder located at the Site. A copy of the procedure for recording environmental complaints was provided to the IO at the time of the inspection.

The Facility has not received a complaint as a result of the operations at the Site.

2.9 SPILLS PREVENTION AND CONTINGENCY PLAN

Is the facility required to have a Spill Prevention Contingency Plan (SPCP) under Ontario Regulation 224/07, Spill Prevention and Contingency Plans?

● Yes ○ No

Specifics:

The Facility has developed and implemented a procedure entitled "Contingency Plans for Odours, Spills, Fires, Power Failures and Labour Disruptions". The procedure has been provided to the ministry and was reviewed during the inspection process.

No spills were reported to the ministry for the 2011 operating year.

Is a SPCP developed which includes an analysis of spills to all media – air, land and water?

● Yes ○ No

Specifics:

The procedure in place at the Facility speaks to spills to land, water (which would enter the Facility's Stormwater Management Pond - Industrial Sewage Works), and air.

2.10 BEYOND COMPLIANCE

Are there any Beyond Compliance Projects being implemented at the facility?

○ Yes ● No

Specifics:

N/A

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

No previous or ongoing non-compliance items to address.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?

○ Yes ● No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?

○ Yes ● No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?

○ Yes ● No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?

○ Yes ● No

Specifics:

Was there any indication of minor administrative non-compliance?

○ Yes ● No

Specifics:

5.0 ACTION(S) REQUIRED

No actions are required by the Facility at this time.

6.0 OTHER INSPECTION FINDINGS

None at this time.

7.0 INCIDENT REPORT

1.0 INTRODUCTION

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste, as defined in their waste certificate of approval, for the production of compost. The Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Inside the tunnels, air is blown into the material through the floor and recirculated inside the tunnel then exhausted to the air pollution control equipment. Once the material remains in the tunnels long enough for the temperature to reach 55 degrees Celsius for 3 consecutive days it is cooled down, removed from the tunnels and placed into a screener which separates the material in size fractions. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the waste certificate of approval and then removed from the site as finished compost. All composting activity is undertaken inside the process building. The building is operated under negative pressure, as such all process air and air from the building is directed through the pollution control equipment.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa Source Separated Organics (SSO) collection program and leaf and yard waste program. The City of Ottawa has been collecting the leaf and yard waste co-mingled with the SSO waste.

The facility is approved to operate at a production limit of up to 150,000 tonnes per year of organic waste.

The purpose of this inspection is to assess the sites compliance with the Air Certificate of Approval (CofA) and applicable environmental legislation such as the Environmental Protections Act (EPA) and Reg 419 under the EPA. The inspection consisted of a district file review, site visits and discussions with Greg Mariotti, site operations manager and Henk Van Den Boomen, Orgaworld compost specialist.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. Although the inspection date is listed as starting on October 21st, 2010, the information in this report is also based on site visits done at the facility throughout the year.

A non-hazardous waste transfer processing inspection and an industrial sewage inspection were also carried out at the site. See respective reports for details.

1.1 TARGET SECTOR IN ONTARIO REGULATION 419/05

Is the facility in a target sector identified in Schedule 4 or Schedule 5 of O. Reg. 419/05?

No, the facility is not in a target sector identified in Schedule 4 or Schedule 5.

Specifics:

2.0 INSPECTION OBSERVATIONS

Specifics:
The pollution control equipment currently being used at the facility can be described as follows;

Fans are located throughout the building, these fans suck air from the building to the pollution control equipment, this creates a negative pressure environment within the building. Air from the building and air from the composting tunnels goes through an ammonia scrubber, then one of two biofilters, then a bioscrubber, then the 40 meter stack.

The company is continuously monitoring it's process by a SCADA system. This system is remotely accessed to allow the staff in the Netherlands to tweak the system as needed. The system uses sensors to monitor parameters such as water content, air temperature, oxygen content, air pressure, and air flow. When levels being monitored go outside of pre-programmed acceptable range then an alarm is triggered and a message is sent to the phones of staff personnel who have the ability to monitor the situation off site. The SCADA system gives details of operating parameters in each compost tunnel, in the ammonia scrubber, biofilters, bioscrubber and stack.

Upon entering the building it was apparent that the building was under negative pressure as I could feel air rushing from outside the building.

Ammonia scrubber:

The sulphuric acid tank is located outside the building. At the time of inspection the company has not had to add more sulphuric acid to the tank since it started production. The ammonia scrubber circulates a sulphuric acid solution over a media to scrub ammonia form the air into solution. When the ammonia scrubber gets saturated (pH gets too high) it is replaced. The waste ammonia sulfate gets put in one of the leachate tanks on site.

The incoming waste composition in Ottawa is such that the material has been very dry, the plant operates in a water negative environment and as such, at this time, leachate generated in the operation of the plant gets re-circulated within the plant. The plant needs to bring in extra water and gets it from the stormwater management pond on site.

There are several odour ports throughout the facility. There is an odour port that allows you to sniff the air that is leaving the ammonia scrubber and entering the biofilter.

Biofilter:

At the time of inspection the company was operating two biofilters. The biofilter media is from a local source and comprises of wood roots and trunks. According to the supporting documentation for the application, the biofilter media needs to be replaced every 6 months to a year. At the time of inspection it was indicated that

one of the biofilter tunnel's media was ready to get replaced. The waste media gets brought back inside to get composted.

Since my site visit on October 21st, the company has changed the media of one of the biofilters. The other biofilter media also needs to be replaces, fresh media is on site but the company is waiting for the source test to be finished. The source test is scheduled for December 8th, 2010.

Bioscrubber:

This is the final step before the stack. According to staff water needs to be added to the bioscrubber every 2 to 3 days. At the bottom of the bioscrubber there should be 50-55 cm of water, an alarm goes off if the levels drop bellow 40 cm. The bioscrubber has not been cleaned out since it's commissioning, according to staff there should be no need to clean it out.

Stack:

The stack is 40 meters high, there is a sampling port placed outside at the bottom of the stack in order to sample air right before it goes into the stack. There is also a sampling port inside just after the bioscrubber.

2.1 SITE CONDITIONS

Specifics:

No offsite odours were noted at the time of inspection.

2.2 AUTHORIZING AND CONTROL DOCUMENTATION

Does the facility have authorizing or control documentation in place such as a Certificate of Approval (CofA) ?

Yes

Type of Document	Number	Issue Date	Limit*	Notes
CofA (Air)	7021-7HQNDE	2009/09/16	Yes	

*** Limit in Document**

Specifics:

2.3 EQUIPMENT REQUIRING AUTHORIZING DOCUMENT

Does the facility have the required Certificate(s) of Approval?

- ○ **The facility does not have any required Certificate(s) of Approval (Air).**
- ○ **The facility requires an amendment or additional Certificate(s) of Approval (Air).**
- ○ **The facility requires an amendment or additional Certificate(s) of Approval (other than Air).**
- ● **The facility has the required Certificate(s) of Approval (or is not required to obtain them).**

Specifics:

2.4 LEGISLATIVE NOTIFICATION REQUIREMENTS

Has the facility met all applicable legislative notification requirements for air emissions?

Not Required

Specifics:

2.5 EXCEEDANCE OF A LEGAL LIMIT AND/OR GUIDELINE

Is there information that demonstrates an exceedance of a legal limit and/or guideline for air emissions?

No

Specifics:

*** Type of Exceedance**

2.6 MONITORING AND REPORTING

Has the facility met its assessment requirements?

No

Specifics:
The company is required as per Condition 10.1 to conduct source testing within six (6) months after the start-up date. Source testing was conducted on June 15th, 2010 and the source test report was received at the District Office on August 13th, 2010.
The report indicates that the facility meets the 1 OU requirement.

As per condition 10.1 of the CofA, the facility is required to perform Source Testing every six (6) months thereafter. The next source test should occur before December 15th, 2010. The ministry has accepted the pre-test plan submitted on behalf of the company and the next source test is scheduled for December 8th, 2010.

Has the facility met its reporting requirements?

Not Required

Specifics:

As per condition 5.1 in the CofA the company is required to submit a written summary of activities undertaken in the previous calendar year. This facility has not yet been operating for a full calendar year. **The first report will need to be received by May 31st, 2011 for the 2010 operating year.**

2.7 OPERATIONAL AND MAINTENANCE REQUIREMENTS

Has the facility met its operating/maintenance requirements?

No

Specifics:

In accordance with Condition 6.2 of the CofA the company is required to keep all doors in the enclosed building of the facility fully closed at all times, except when used for necessary personnel or vehicle entrance and exit. At the time of inspection the doors were closed. It should be noted, however, that previous site visits have shown doors being kept open or partly opened. This has been brought up with the company and a marked improvement has been noted on subsequent visits.

Condition 6.1 of the CofA requires the company to create a manual outlining the operating procedures and maintenance programs for all Processes with Significant Environmental Aspects. The required information can be found in the Operations Manual and in the Odour Monitoring Program. **It would not appear, however, that the company has implemented the monitoring program. See action items listed in Section 5.0.**

2.8 RECORD KEEPING REQUIREMENTS

Has the facility met its record keeping requirements?

No

Specifics:

Condition 7 of the CofA details the complaint recording procedures. The company currently logs any complaints received electronically and also prints out a hard copy and leaves it in a binder on site. As of October 21st, 2010 the company has logged 3 complaints for the 2010 operating year. All 3 complaints were regarding odour.

The company is currently working on getting together maintenance plans as well as lists of spare parts for their equipment. There are Operations Manuals for the air pollution control equipment on site, but **a maintenance schedule based on the manuals needs to be created**. **See action items listed in Section 5.0**

2.9 BEYOND COMPLIANCE

Are there any Beyond Compliance Projects being implemented at the facility?

No

Specifics:

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate ?

No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?
No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?
No

Specifics:

Was there any indication of minor administrative non-compliance?
Yes

Specifics:
- maintenance schedule log not being kept

5.0 ACTION(S) REQUIRED

1- Create and implement a maintenance schedule as discussed in Section 2.8 of this report.
2- Create, implement and maintain as spare parts list and inventory.

3- Submit a report of compliance with actions items 1 and 2 listed above to the undersigned officer.
Due: February 4th, 2010.

1.0 INTRODUCTION

For Clarity within this report it should be noted that the Ministry of the Environment has restructured their approvals process. AS of October 31st, 2011, all Certificates of Approval will be referred to as Environmental Compliance Approvals (ECA).

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste, as defined in their waste ECA, for the production of compost. The Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Once the material remains in the tunnels long enough for the temperature to reach 55 degrees Celsius for 3 consecutive days it is cooled down, removed from the tunnels and placed into a screener which separates the material in size fractions. The screener separates the material into 20+ (which includes large pieces of material that have not composted), 12-20 material (which is medium sized material), incidental waste, and compost. The 20+ material is used as inoculate and mixed in with fresh material in the Mixing Hall, or further shredded and run through the screener again. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the certificate of approval and then removed from the site as finished compost. It should be noted that the material sized as 12-20 is also referred to as "10-100" material as that was the original screen size.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa is currently collecting the leaf and yard waste commingled with the SSO waste. It should be noted that the City of Ottawa started commingling

their leaf and yard waste with the SSO organics and sending it to Orgaworld in April 2010.

The purpose of the inspection is to assess the sites compliance with their Waste Certificate of Approval (CofA) and applicable environmental legislation such as the Environmental Protection Act (EPA) and Reg 347 under that same act. The inspection consisted of a District file review, site visit and discussions with Greg Mariotti, site operations manager.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff throughout the year.

An air facility inspection and an industrial sewage inspection were also carried out at the site. See respective reports for details.

2.0 INSPECTION OBSERVATIONS

Certificate of Approval Number(s): ● Yes ○ No
C of A Number(s):
#2766-7HEPSZ issued September 16, 2009
2766-7HEPSZ Notice No. 1 issued October 21, 2010 to allow for a mobile grinding unit to temporarily operate on site

The company currently has an application with the Ministry to request a change in operating hours and for ability to host household hazardous waste days.

2.1 SITE OPERATION:

Specifics:

Throughout the inspection report, the names allocated to the different areas within the processing building as described in Figure 5.1 from the document titled: "Application for a Provisional Certificate of Approval for a Waste Disposal Site" dated June 2008.

General site observations from September 19th, 2011:

Fresh waste was seen piled in the Truck Hall. At the time of inspection there were several trucks depositing waste; waste gets pushed to the side until traffic slows down and then it is moved into the Receiving and Sorting Hall. Fresh material appeared to be mostly leaf and yard waste. It should be noted that the original design plans indicated that waste would be deposited directly into the Receiving Hall, no waste was to be deposited in the Truck Hall. Should odour issues arise the issue will need to be re-assessed.

A shredder is placed at the side of the Receiving and Sorting Hall and is used to shred incoming waste , shredded waste is then mixed with 12-20 inoculate and placed directly in one of the compost tunnels or placed in the mixing hall. At the time of inspection, there was mixed waste and 12-20 material in the Mixing Hall, there was also 12-20 material piled in the Receiving and Sorting Hall.

Compost tunnels #1, 3, 4 and 5 were full and in different stages of composting. Tunnel #2 was getting screened.

Tunnels #7 and 8 are being used to store 12-20 material.

The Compost Curing Hall has been divided into bunkers with the use of concrete blocks; this better ensures there is no cross contamination between piles of compost in different stages of curing.
Finished compost is still being stored at the Tomlinson site located in back of 3200 Rideau Rd. but the company is no longer planning on adding more compost to this site, they have an arrangement with a farmer in St-Isidore to store compost at his site.

Negative pressure is maintained inside the building by the use of fans sucking air into the ventilation system that leads to the pollution control equipment. Sensors are placed by the fans to measure air pressure and the SCADA system monitors and controls fan speed. During a site visit it was noted that the fan in the receiving Hall had an actual pressure set point of 1 Pa even thought the system had a programmed setpoint of -20Pa. The fan 02 screening hall

had an actual pressure point of -1Pa but a programmed setpoint of -20Pa. It should be noted that the sensors are placed to monitor the difference in negative pressure between two sections of the building but not between the inside and outside of the building. Although I have not noted an absence in negative pressure in the building during my site visits as outdoor air is felt rushing into the building when the doors are open, the current monitoring system does not seems be able to accurately reflect and monitor for negative pressure inside the building.
See action items in Section 5.0

Observations regarding some conditions in the ECA:

Condition 2. Service are, approved waste types, rates & storage
- Tonnage records were reviewed, no non compliances were noted. It should be noted, however, that there seem to be discrepancies between the 2010 annual summary mass balance listed in the 2010 annual report and the 2010 mass balance calculated from the excel spreadsheet supplied by the company. **Please see action items listed in Section 5.0 of this report.**

Condition 7 Quality criteria, testing & monitoring
- the company tests incoming waste on a monthly basis.
- monitoring of the composting material inside the tunnels is done electronically through a SCADA system.
- The Ottawa District Office has not received any odour complaints from the site since those documented in the previous inspection report.
- The company samples their compost. Some sample results were submitted and verified, the following issues were noted:

- Tunnel 8 compost collected Dec 10th, 2010	Exceedence in Molybdenum
- Bunker #1 compost collected Feb 25, 2011	Exceedence in Fecal Coliform
- Biofilter #3 compost collected April 18th, 2011	Not tested for PCB's
- Bunker #2 compost collected July 27th, 2011	Exceedence in Chromium, Nickel, Selenium

See action items listed in Section 5.0 of this report.

The company has submitted an Odour Monitoring Program in accordance with condition 7(13) of the approval. Pages 7- 11 of the monitoring plan make reference to monitoring requirements for the pollution control equipment. At the time of inspection it was not confirmed whether or not the company is performing the maintenance and monitoring requirements as outlined in the Odour Monitoring Program. Daily, weekly and monthly maintenance inspection sheets were supplied but they dealt with operational equipment, not the pollution control equipment. The Odour Monitoring Program indicates that all results of the monitoring program are to be entered into the "odour system monitoring report" spreadsheet.
See Section 5.0 Action Items

Condition 8 Nuisance impact control & housekeeping
- The company calls in a sweeping company to clean of the asphalt parking area if and when it gets dirty.
- The company has an agreement with Holistech to handle vermin an vector, they come in once a month.

Condition 12 Records keeping
- The company has submitted their 2010 annual report. which includes a condition by condition assessment of conditions in the certificate of approval.

2.2 FINANCIAL ASSURANCE:

Specifics:

Financial assurance has been received by the company.
According to Condition 1(20) the company is required to have Financial Assurance of $727,700. Should the company increase their Maximum Approval Waste Processing Capacity to 150,000 tonnes they will need to increase their financial assurance to $1,018,000.

2.3 SITE SERVICE AREA:

Specifics:

In accordance with Condition 2(1) the site may only accept solid non -hazardous domestic, commercial, institutional or

industrial Organic waste for the Province of Ontario and Quebec limited to the Organic Waste listed in Condition 2 of the Approval.

The facility is currently only accepting organic waste and leaf and yard waste for the City of Ottawa waste collection program.

2.4 APPROVED SITE CAPACITY:

Specifics:

Tonnage record shave been reviewed from September 2010 to July 14th 2011. No exceedences were noted.

Tonnages received is measured by a scale located on site.
The site has not had to reject a load of waste.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

No on-going previous issues of non-compliance.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?
Yes

Specifics:
Exceedences in finished compost criteria.

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?
No

Specifics:

Was there any indication of minor administrative non-compliance?
Yes

Specifics:
Discrepancy in tonnage amounts.
Monitoring and maintenance of pollution control equipment.

5.0 ACTION(S) REQUIRED

1. Review and provide an update on the methods used to monitor negative pressure inside the building.

2. Submit a detailed explanation as to how the finished compost is sampled. The explanation should include how the company handled the exceedences noted in Section 2.1 of this report.

3. Explain discrepency in tonnage amounts between the excell spreadsheet and the 2010 annual report.

4. Submit confirmation that monitoring and maintenance of the pollution control equipment is being conducted in accordance with the Odour Monitoring Program dated October 2009. Include odour system monitoring report spreadsheets for the month of June, 2011 for the ammonium scrubber, the biofilter and the bioscrubber.

Submit all information required above to

1.0 INTRODUCTION

For Clarity within this report it should be noted that the Ministry of the Environment has restructured their approvals process. As of October 31st, 2011, all Certificates of Approval will be referred to as Environmental Compliance Approvals (ECA).

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste, as defined in their waste ECA, for the production of compost. The Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Inside the tunnels, air is blown into the material through the floor and recirculated inside the tunnel then exhausted to the air pollution control equipment. Once the material remains in the tunnels long enough for the temperature to reach 55 degrees Celsius for 3 consecutive days it is cooled down, removed from the tunnels and placed into a screener which separates the material in size fractions. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the waste ECA and then removed from the site as finished compost. All composting activity is undertaken inside the process building. The building is operated under negative pressure, as such all process air and air from the building is directed through the pollution control equipment.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa Source Separated Organics (SSO) collection program and leaf and yard waste program. The City of Ottawa has been collecting the leaf and yard waste commingled with the SSO waste.

The facility is approved to operate at a production limit of up to 150,000 tonnes per year of organic waste.

The purpose of this inspection is to assess the sites compliance with the Air ECA and applicable environmental legislation such as the Environmental Protections Act (EPA) and Reg 419 under the EPA. The inspection consisted of a district file review, site visits and discussions with Greg Mariotti, site operations manager.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff throughout the year. The visual site inspection was conducted on Sept 19th and a review of paperwork was conducted on the 30th of September.

A non-hazardous waste transfer processing inspection and an industrial sewage inspection were also carried out at the site. See respective reports for details.

1.1 TARGET SECTOR IN ONTARIO REGULATION 419/05

Is the facility in a target sector identified in Schedule 4 or Schedule 5 of O. Reg. 419/05?

No, the facility is not in a target sector identified in Schedule 4 or Schedule 5.

Specifics:

2.0 INSPECTION OBSERVATIONS

Specifics:

The pollution control equipment currently being used at the facility can be described as follows;

Fans are located throughout the building, these fans suck air from the building to the pollution control equipment, this creates a negative pressure environment within the building. Air from the building and air from the composting tunnels goes through an ammonia scrubber, then one of two biofilters, then a bioscrubber, then the 40 meter stack.

The company is continuously monitoring it's process by a SCADA system. This system is remotely accessed to allow to remotely tweak the system as needed. The system uses sensors to monitor parameters such as water content, air temperature, oxygen content, air pressure, and air flow. When levels being monitored go outside of preprogrammed acceptable range then an alarm is triggered and a message is sent to the phones of staff personnel who have the ability to monitor the situation off site. The SCADA system gives details of operating parameters in each compost tunnel, in the ammonia scrubber, biofilters, bioscrubber and stack.

Ammonia scrubber:

The sulphuric acid tank is located outside the building. The ammonia scrubber circulates a sulphuric acid solution over a media to scrub ammonia from the air into solution. When the ammonia scrubber gets saturated (pH gets too high) it is replaced. The waste ammonia sulfate gets put in one of the leachate tanks on site.

The incoming waste composition in Ottawa is such that the material has been very dry, the plant operates in a water negative environment in the summer and as such leachate generated in the operation of the plant gets re-circulated within the plant. If the plant needs to bring in extra water they take it from the stormwater management pond on site.

There are several odour ports throughout the facility.

Biofilter:

At the time of inspection the company was operating two biofilters. According to the supporting documentation for the application, the biofilter media needs to be replaced every 6 months to a year. The media was last replaced around November 2010 and is scheduled to be replaced around November 2011. The waste media gets brought back inside to get composted.

Bioscrubber:

This is the final step before the stack. According to staff water needs to be added to the bioscrubber every 2 to 3 days. At the bottom of the bioscrubber there should be 50-55 cm of water, an alarm goes off if the levels drop bellow 40 cm.

Stack:

The stack is 40 meters high, there is a sampling port placed outside at the bottom of the stack in order to sample air right before it goes into the stack. There is also a sampling port inside just after the bioscrubber.

2.1 SITE CONDITIONS

Specifics:

No offsite odours were noted at the time of inspection.

2.2 AUTHORIZING AND CONTROL DOCUMENTATION

Does the facility have authorizing or control documentation in place such as a Certificate of Approval (CofA) ?

Yes

Type of Document	Number	Issue Date	Limit*	Notes
CofA (Air)	7021-7HQNDE	2009/09/16	Yes	

*** Limit in Document**

Specifics:

2.3 EQUIPMENT REQUIRING AUTHORIZING DOCUMENT

Does the facility have the required Certificate(s) of Approval?

- ○ **The facility does not have any required Certificate(s) of Approval (Air).**
- ○ **The facility requires an amendment or additional Certificate(s) of Approval (Air).**
- ○ **The facility requires an amendment or additional Certificate(s) of Approval (other than Air).**
- ● **The facility has the required Certificate(s) of Approval (or is not required to obtain them).**

Specifics:

2.4 LEGISLATIVE NOTIFICATION REQUIREMENTS

Has the facility met all applicable legislative notification requirements for air emissions?

Yes

Specifics:

2.5 EXCEEDANCE OF A LEGAL LIMIT AND/OR GUIDELINE

Is there information that demonstrates an exceedance of a legal limit and/or guideline for air emissions?

No

Specifics:

The Company has submitted a Written Summary for Reporting Year 2010 dated May 27, 2011. The report includes an updated Emission Summary Table that indicates that contaminants remain bellow their respective POIs.

*** Type of Exceedance**

2.6 MONITORING AND REPORTING

Has the facility met its assessment requirements?

Yes

Specifics:

As per Condition 10.1, the company is required to conduct source testing every six (6) months after the start-up date and every (6) months thereafter. The start-up date was January 28th, 2010.

Source testing was conducted on:
June 15th 2010
December 8th, 2010
July 6th, 2011

The next source testing has been scheduled for December 6th, 2011.

Has the facility met its reporting requirements?

Yes

Specifics:

As per condition 5.1 of the ECA, the company is required to submit a written summary of activities undertaken in the previous calendar year. The report needs to be provided to the Ministry by **March 31st of each year**.

The 2010 written summary is dated May 27th, 2011 and was received by the Ottawa District Office on May 30th, 2011. It should be noted that the written summary for 2010 was submitted late.

2.7 OPERATIONAL AND MAINTENANCE REQUIREMENTS

Has the facility met its operating/maintenance requirements?

Yes

Specifics:

Condition 6 of the ECA details the operational and maintenance requirements for the plant.

At the time of inspection the Site Supervisor conducts daily checks in accordance with a daily check list. A blank copy of this check list was supplied at the time of inspection, filled out check lists are kept on site and were reviewed at the time of inspection.

Several other check lists and inspection sheets are being filled out, all to do with operating equipment on site.

Monitoring of building negative pressure and the operation and maintenance requirements for the pollution control requirement are addressed under Section 2.1 of the non-hazardous waste transfer processing inspection.

2.8 RECORD KEEPING REQUIREMENTS

Has the facility met its record keeping requirements?

Yes

Specifics:

The company logs complaints and places a copies of the complaints in a binder on site. There have not been any complaints logged by the ministry or the company since the previous inspection.

A maintenance schedule and inventory list is kept on site. Maintenance work orders are generated as needed and inspection log sheets are filled out by staff. All paperwork is kept in binders on site and overviewed by the site manager.

2.9 BEYOND COMPLIANCE

Are there any Beyond Compliance Projects being implemented at the facility?

No

Specifics:

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

No on-going issues of non-compliance related to air.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?

No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?

No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?

No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?

No

Specifics:

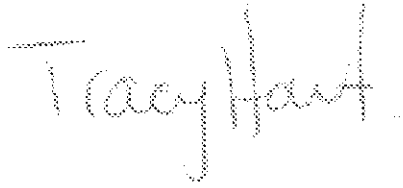
Was there any indication of minor administrative non-compliance?
No

Specifics:

5.0 ACTION(S) REQUIRED

No actions required at this time.

6.0 OTHER INSPECTION FINDINGS



No other inspection findings at this time.

Region:	Eastern		

1.0 INTRODUCTION

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste as defined in their waste certificate of approval for the production of compost. Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Parameters being monitored include humidity levels. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the waste certificate of approval and then removed from the site as finished compost. All process air and air from the receiving hall is directed through pollution control equipment. Leachate generated as a result of the composting process gets recirculated, any excess is kept in storage tanks.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa has been collecting the leaf and yard waste co-mingled with the SSO waste.

The facility is approved to operate at a production limit of up to 150,000 tonnes per year of organic waste.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. Although the inspection date is listed as starting November 25th, 2010, the information in this report is also based on site visits done at the facility throughout the year.

The purpose of this inspection is to assess the sites compliance with their Industrial Sewage Works Certificate of approval and applicable environmental legislation such as the Ontario Water Resources Act (OWRA). The inspection consisted of a d
district file review, site visit and discussions with Greg Mariotti, site operations manager.

An air facility inspection and non -hazardous waste transfer processing inspection were also carried out at the site. See respective reports for details.

2.0 INSPECTION OBSERVATION

Facility MEWS (Works) Number:
Not applicable

Sector Type:
Other

Specify Other:
Composting facility

Effluent Type:
Storm Water

Receiver Type:
Surface Water

Name of Receiver:
Findlay Creek

Is there a sensitive receptor on/in the receiver?
No

Certificate of Approval Number(s):
Yes
C of A Number(s): 7032-88XPRA issued September 7, 2010.

The original CofA was #9465-7NVRWT issued September 16, 2009. This CofA was amended to reflect changes in the monitoring wells.

2.1 WASTEWATER TREATMENT PROCESS DESCRIPTION

Stormwater is collected in an on-site open ditch system leading to a stormwater management pond that discharges off site to the Hawthorne Industrial Park ditch system which eventually leads to Findlay Creek.

Process water generated inside the building gets stored in leachate holding tanks buried on the East side of the building. Should the facility need to use water in their process (wetting the composting material) they use the leachate from the storage tanks and/or water from the stormwater pond. Should the leachate tanks need to be emptied the company has been contacting Lacombe to pick up and dispose of the leachate. The HWIN generator number for the site is ON3338779, and indicates that the leachate is classified as waste class 270L. According to company officials the facility is operating in a water negative environment, however, as a result of several fires at the facility the leachate tanks have filled up and needed to get pumped our on several occasions.

It was noted that the company has altered their stormwater system as a result of the accumulation of compost and ground-water infiltration along the ditch across from the compost curing area loading doors. The company has altered their sewage works by lining the ditch with clay and stones and installing a chamber with a pump directing some of the stormwater back to the leachate storage tanks.
Section 53 (1) of the OWRA states that no person shall establish, alter, extend or replace new or existing sewage works except under and in accordance with an approval granted by a Director.
See Section 5.0 Actions required

The company also has a sump pump pumping groundwater infiltration from their pumping station to the parking lot. The maximum pumping capacity for the system will need to be verified, should the pumping capacity of the system exceed 50,000 Liters of water a day a Permit to Take Water from the Ministry of the Environment will be needed. This discharge water should also be noted in the S53 approval amendment application required above.
See Section 5.0 Actions required

2.2 EFFLUENT SUMMARY REPORT

What are the facility's effluent limits based on?
None

Does the facility comply with its limits?
Yes

The Certificate of Approval does not refer to any exceedance limits but refers to trigger parameters. Should the stormwater exceed any of the trigger parameters it would be considered leachate contaminated stormwater and would not be allowed to be discharged from the stormwater management pond.The stormwater management pond can only be discharged when sampling shows that the water does not exceed trigger levels listed in Table 2 of the Certificate.

Table 2
Trigger Parameters

Parameter	Trigger Level (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

The company is required to take monthly samples of stormwater pond. Monthly sample results were reviewed from March to October 2010. It was noted that twice the sample results exceeded the trigger limits for E-coli and twice the sample results exceed the trigger limit for Total Suspended Solids.

2.3 SEWAGE TREATMENT WORKS CAPACITY ASSESSMENT

Flow (m^3/day)	Year 1	Year 2	Year 3
Average daily flow	0.00	0.00	0.00
Maximum daily flow	0.00	0.00	0.00
Capacity Design	0.00	0.00	0.00
% of capacity (based on average daily flow)	0.00	0.00	0.00

The Certificate of approval does not require flow measurement nor list any design capacity. In accordance to condition 6(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation. The owner is also required to maintain a log book to record the results of these inspections.

At the time of inspection it was noted that the southern part of the berm had breached and water had

overflowed outside of the pond. This was brought to the attention of the company. It is unclear when the breach occurred as the company was not aware of the breach and had no records of previous site inspections. The berm has since been fixed.

The pond needed to be discharged in December to give enough freeboard for the spring thaw. Sample results for December indicated exceedences of the TSS trigger parameters. The company has indicated that they need to discharge and have submitted a report, dated December 15, 2010, in accordance with Condition 6(10) of their CofA.

2.4 SAMPLING REQUIREMENTS

What are the facility's sampling requirements based on?
Certificate of Approval/Permit

Does the facility meet sampling requirements?
Yes

Table 1 - Effluent Monitoring
SWM Pond

General Parameters	Inorganic	Field Parameters
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

The company has been sampling the pond once a month as well as prior to any discharge.

2.5 REPORTING REQUIREMENTS

What are the facility's reporting requirements based on?
Certificate of Approval/Permit

Does the facility meet reporting requirements?
Yes

In accordance with Condition 6(10) Orgaworld is required to notify the District Manger orally, as soon as

possible, and in witting within seven (7) days of the discharge to receiving surface water of leachate contaminated sewage. The breach of the pond is considered a discharge, the company had not sampled prior to the breach and therefore was not able to determine if the spilled water was leachate contaminated. Concern is also raised as the previous sampling results indicated that the sewage water exceeded the E-coli trigger parameter.

Pond water that breached and pooled on site was sampled. Sample results indicate an exceedence in the TSS trigger parameters listed in the certificate of approval as well as the E-coli parameter. Mitigative action has been described by the company in the report dated December 15, 2010

Condition 4 of the certificate requires the Owner to submit to the District manager a set of as constructed drawings within one year of the Substantial Completion of the Work. These drawing have not yet been submitted, the drawings submitted should reflect the alterations made to the system noted in Section 2.1 of this report.
See Action Items listed in Section 5.0

2.6 FLOW MEASUREMENT

Flow measurements are not a requirement in the Certificate of Approval

2.7 MINISTRY SAMPLE RESULTS

Were Ministry samples collected during the inspection??
No

Reason:
Facility was not discharging at the time of inspection.

The facility was not discharging at the time of inspection therefore no samples were taken. Sample results were reviewed of their monthly samples.

2.8 FINANCIAL ASSURANCE

The facility holds financial assurance in accordance with Waste Certificate of Approval #2766-7HEPSZ

2.9 SPILL PREVENTION AND CONTINGENCY PLANS

Is the facility required to have a Spill Prevention and Contingency Plan (SPCP) as required by Ontario Regulation 224/07?
No

Has the facility had any spills since the last inspection?
Yes

Were all the spills reported to the ministry?
Yes

Does the facility's operations or spill history suggest that a SPCP be developed?
No

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

4.0 SUMMARY OF INSPECTION FINDINGS

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment?
Yes

Specifics:

Alteration of sewage works without approval.

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material?
Yes

Specifics:

Breach of the berm

Was there any indication of minor administrative non-compliance?
No

Specifics:

5.0 ACTION(S) REQUIRED

1- Submit to the Ministry of the Environment a complete application for an amendment to the Sewage Works Certificate of Approval # 7032-88XPRAto reflect the alterations made to the system.
Due by March 18th, 2010.

2- Submit to the undersigned, a report detailing the maximum pumping capacity of the sump pump at the site.
Due by January 21st, 2010

1.0 INTRODUCTION

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste as defined in their waste certificate of approval for the production of compost. Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Parameters being monitored include humidity levels. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the waste certificate of approval and then removed from the site as finished compost. All process air and air from the receiving hall is directed through pollution control equipment. Leachate generated as a result of the composting process gets recirculated, any excess is kept in storage tanks.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa has been collecting the leaf and yard waste co-mingled with the SSO waste.

The facility is approved to operate at a production limit of up to 150,000 tonnes per year of organic waste.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. Although the inspection date is listed as starting November 25th, 2010, the information in this report is also based on site visits done at the facility throughout the year.

The purpose of this inspection is to assess the sites compliance with their Industrial Sewage Works Certificate of approval and applicable environmental legislation such as the Ontario Water Resources Act (OWRA). The inspection consisted of a d
district file review, site visit and discussions with Greg Mariotti, site operations manager.

An air facility inspection and non -hazardous waste transfer processing inspection were also carried out at the site. See respective reports for details.

2.0 INSPECTION OBSERVATION

Facility MEWS (Works) Number:
Not applicable

Sector Type:
Other

Specify Other:
Composting facility

Effluent Type:
Storm Water

Receiver Type:
Surface Water

Name of Receiver:
Findlay Creek

Is there a sensitive receptor on/in the receiver?
No

Certificate of Approval Number(s):
Yes
C of A Number(s): 7032-88XPRA issued September 7, 2010.

The original CofA was #9465-7NVRWT issued September 16, 2009. This CofA was amended to reflect changes in the monitoring wells.

2.1 WASTEWATER TREATMENT PROCESS DESCRIPTION

Stormwater is collected in an on-site open ditch system leading to a stormwater management pond that discharges off site to the Hawthorne Industrial Park ditch system which eventually leads to Findlay Creek.

Process water generated inside the building gets stored in leachate holding tanks buried on the East side of the building. Should the facility need to use water in their process (wetting the composting material) they use the leachate from the storage tanks and/or water from the stormwater pond. Should the leachate tanks need to be emptied the company has been contacting Lacombe to pick up and dispose of the leachate. The HWIN generator number for the site is ON3338779, and indicates that the leachate is classified as waste class 270L. According to company officials the facility is operating in a water negative environment, however, as a result of several fires at the facility the leachate tanks have filled up and needed to get pumped our on several occasions.

It was noted that the company has altered their stormwater system as a result of the accumulation of compost and ground-water infiltration along the ditch across from the compost curing area loading doors. The company has altered their sewage works by lining the ditch with clay and stones and installing a chamber with a pump directing some of the stormwater back to the leachate storage tanks.
Section 53 (1) of the OWRA states that no person shall establish, alter, extend or replace new or existing sewage works except under and in accordance with an approval granted by a Director.
See Section 5.0 Actions required

The company also has a sump pump pumping groundwater infiltration from their pumping station to the parking lot. The maximum pumping capacity for the system will need to be verified, should the pumping capacity of the system exceed 50,000 Liters of water a day a Permit to Take Water from the Ministry of the Environment will be needed. This discharge water should also be noted in the S53 approval amendment application required above.
See Section 5.0 Actions required

2.2 EFFLUENT SUMMARY REPORT

What are the facility's effluent limits based on?
None

Does the facility comply with its limits?
Yes

The Certificate of Approval does not refer to any exceedance limits but refers to trigger parameters. Should the stormwater exceed any of the trigger parameters it would be considered leachate contaminated stormwater and would not be allowed to be discharged from the stormwater management pond.The stormwater management pond can only be discharged when sampling shows that the water does not exceed trigger levels listed in Table 2 of the Certificate.

Table 2
Trigger Parameters

Parameter	Trigger Level (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

The company is required to take monthly samples of stormwater pond. Monthly sample results were reviewed from March to October 2010. It was noted that twice the sample results exceeded the trigger limits for E-coli and twice the sample results exceed the trigger limit for Total Suspended Solids.

2.3 SEWAGE TREATMENT WORKS CAPACITY ASSESSMENT

Flow (m^3/day)	Year 1	Year 2	Year 3
Average daily flow	0.00	0.00	0.00
Maximum daily flow	0.00	0.00	0.00
Capacity Design	0.00	0.00	0.00
% of capacity (based on average daily flow)	0.00	0.00	0.00

The Certificate of approval does not require flow measurement nor list any design capacity. In accordance to condition 6(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation. The owner is also required to maintain a log book to record the results of these inspections.

At the time of inspection it was noted that the southern part of the berm had breached and water had

overflowed outside of the pond. This was brought to the attention of the company. It is unclear when the breach occurred as the company was not aware of the breach and had no records of previous site inspections. The berm has since been fixed.

The pond needed to be discharged in December to give enough freeboard for the spring thaw. Sample results for December indicated exceedences of the TSS trigger parameters. The company has indicated that they need to discharge and have submitted a report, dated December 15, 2010, in accordance with Condition 6(10) of their CofA.

2.4 SAMPLING REQUIREMENTS

What are the facility's sampling requirements based on?
Certificate of Approval/Permit

Does the facility meet sampling requirements?
Yes

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganic**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

The company has been sampling the pond once a month as well as prior to any discharge.

2.5 REPORTING REQUIREMENTS

What are the facility's reporting requirements based on?
Certificate of Approval/Permit

Does the facility meet reporting requirements?
Yes

In accordance with Condition 6(10) Orgaworld is required to notify the District Manger orally, as soon as

possible, and in witting within seven (7) days of the discharge to receiving surface water of leachate contaminated sewage. The breach of the pond is considered a discharge, the company had not sampled prior to the breach and therefore was not able to determine if the spilled water was leachate contaminated. Concern is also raised as the previous sampling results indicated that the sewage water exceeded the E-coli trigger parameter.

Pond water that breached and pooled on site was sampled. Sample results indicate an exceedence in the TSS trigger parameters listed in the certificate of approval as well as the E-coli parameter. Mitigative action has been described by the company in the report dated December 15, 2010

Condition 4 of the certificate requires the Owner to submit to the District manager a set of as constructed drawings within one year of the Substantial Completion of the Work. These drawing have not yet been submitted, the drawings submitted should reflect the alterations made to the system noted in Section 2.1 of this report.
See Action Items listed in Section 5.0

2.6 FLOW MEASUREMENT

Flow measurements are not a requirement in the Certificate of Approval

2.7 MINISTRY SAMPLE RESULTS

Were Ministry samples collected during the inspection??
No

Reason:
Facility was not discharging at the time of inspection.

The facility was not discharging at the time of inspection therefore no samples were taken. Sample results were reviewed of their monthly samples.

2.8 FINANCIAL ASSURANCE

The facility holds financial assurance in accordance with Waste Certificate of Approval #2766-7HEPSZ

2.9 SPILL PREVENTION AND CONTINGENCY PLANS

Is the facility required to have a Spill Prevention and Contingency Plan (SPCP) as required by Ontario Regulation 224/07?
No

Has the facility had any spills since the last inspection?
Yes

Were all the spills reported to the ministry?
Yes

Does the facility's operations or spill history suggest that a SPCP be developed?
No

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

4.0 SUMMARY OF INSPECTION FINDINGS

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment?
Yes

Specifics:

Alteration of sewage works without approval.

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material?
Yes

Specifics:

Breach of the berm

Was there any indication of minor administrative non-compliance?
No

Specifics:

5.0 ACTION(S) REQUIRED

1.0 INTRODUCTION

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste, as defined in their waste certificate of approval, for the production of compost. The Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Once the material remains in the tunnels long enough for the temperature to reach 55 degrees Celsius for 3 consecutive days it is cooled down, removed from the tunnels and placed into a screener which separates the material in size fractions. The screener separates the material into 100+ (which includes large pieces of material that have not composted -branches, large pieces of incidental plastic), 10-100 material (which is medium sized material), incidental waste, and compost. The 100+ material might get sent to landfill or sent back to the shredder and enter the compost stream at the front of the line. The 10-100 material is used as inoculate and mixed in with fresh material in the Mixing Hall. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the certificate of approval and then removed from the site as finished compost.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa is currently collecting the leaf and yard waste co-mingled with the SSO waste. It should be noted that the City of Ottawa started co-mingling their leaf and yard waste with the SSO organics and sending it to Orgaworld in April 2010.

The purpose of the inspection is to assess the sites compliance with their Waste Certificate of Approval (CofA) and applicable environmental legislation such as the Environmental Protection Act (EPA) and Reg 347 under that same act. The inspection consisted of a District file review, site visit and discussions with Greg Mariotti, site operations manager.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. Although the time of inspection is listed as September 20th, 2010, the information in this report is also based on site visits done at the facility throughout the year.

An air facility inspection and an industrial sewage inspection were also carried out at the site. See respective reports for details.

2.0 INSPECTION OBSERVATIONS

Certificate of Approval Number(s): ● Yes ○ No
C of A Number(s): 2766-7HEPSZ, issued September 16th, 2009

2.1 SITE OPERATION:

Throughout this inspection report, the names allocated to the different areas within the processing building are as described in Figure 5.1 from the document titled: "Application for a Provisional Certificate of Approval for a Waste Disposal Site" dated June 2008.

General site observations from Sept 20th, 2010 :

10-100 material was piled in the Truck Hall, there was also some "fresh" waste that had recently been dropped off. The fresh material appeared to consist mostly of leaf and yard waste, the odd plastic bag was noted. Fresh material was also seen piled in the Receiving and Sorting Hall, a small amount of 10-100 material was seen in the eastern corner of the Receiving Hall. The Mixing Hall was approximately 3/4 full of 10-100 material. Tunnel #4 was being emptied, the front end loader was taking material from tunnel 4 to the screener.

Orgaworld is currently operating 6 compost tunnels. At the time of inspection tunnel #4 was being emptied. Tunnels #7 and 8 are shells, one is being used to store 10-100 material the other is being used to store curing compost.

There are two operating biofilters at the site and a third shell of a biofilter tunnel. Orgaworld has installed doors on the biofilter tunnel shell and has connected duct work to create a negative pressure in the tunnel and plans on using this as storage for 10-100 material or curing compost. This biofilter shell is not currently being monitored by the SCADA system.

According to staff, the increase in leaf and yard waste co-mingled with SSO has caused some operational challenges for Orgaworld as the material does not break down as easily. As a result Orgaworld has been accumulating a lot more 10-100 material than was expected. Orgaworld is selling this 10-100 material to some farmers as mulch.

At the start of operations the amount of SSO received was, on average, approximately 82 tonnes per operating day. The City of Ottawa decided to collect the City's leaf and yard waste co-mingled with the SSO waste. This greatly increased the volume and tonnage of material received. As an example, the site received, on average, approximately 292 tonnes per operating day in June, 2010.

On my site visit of September 20th, 2010, compost was being removed for the compost Curing Hall and loaded onto a truck. The compost will be brought to Orgaworlds compost storage site located in back of 3200 Rideau Rd, Ottawa. It should be noted that, as of November 29th, 2010 there is approximately 7,600 tonnes of compost at the storage site. Orgaworld is leasing this site from Tomlinson to store finished compost until buyers are found and ready to accept the compost.

At the time of inspection, the bay doors to the Processing Building were closed with the exception of one door from the compost curing hall because compost was being removed from the hall.

There were three piles of 10-100 material located outside the facility, these piles were side by side on the eastern side of the building. The piles were outside as a result of three separate fires that occurred inside the building. There has also been a fourth fire but the material was never brought outside. The company has been instructed to remove the material once it is deemed safe. Since then the material has been removed

from the site and sold as mulch.

Observations regarding some conditions in the CofA:

Condition 2. Service area, approved waste types, rates & storage.
- It should be noted that the company has appealed Conditions 2(i) and 2(ii) of the certificate of approval to the ERT. The Tribunal has not yet made a decision.
- Tonnage records were reviewed, no non compliances were noted.
- There have been some issues with outside storage of waste on site. The company has stored material outside as a result of 4 fires that occurred during the summer. This material has since been removed and the company has submitted a detailing the events and measures taken to prevent reoccurrence.

Condition 3. Signs
- Orgaworld has posted a sign at their front gate that complies with the condition.

Condition 5 Site Operations
- According to company officials no waste has been rejected.

Condition 6 Equipment and site inspections & maintenance
- Daily site inspections are conducted and a record is produced.
- The company has not yet created and implemented a preventative maintenance program for all on -Site equipment. See Air Inspection report for further action to be undertaken.

Condition 7 Quality criteria, testing & monitoring
- Every quarter there is an audit done of incoming SSO waste with the City of Ottawa. The company also does their own sampling of incoming waste.
- Finished compost sample results were reviewed, no non compliance issues were noted.
- Monitoring of the composting material is done electronically through a SCADA system.
- The odour monitoring program was received on October 30th, 2009. Since the start up of the operation the Ministry has received 3 odour complaints for the company. While it was not possible to conclusively determine the source of the odours, it is believed that the source is the pile of finished compost being stored at the compost storage site on Rideau.

Condition 8 Nuisance impact control & housekeeping
- A pressure washer is available inside the Truck hall in the event the trucks need to get cleaned.
- The company calls in a sweeping company to clean off the asphalt parking area if and when it gets dirty.
- the company has an agreement with an extermination company to handle vermin and vector.

Condition 9 Operations manual & staff training
- The Operations manual was received October 30th, 2009.

Condition 10 Emergency response and contingency plan
- The contingency plan was received on October 30th, 2009
- The plan in kept at the front office in a cabinet and is accessible to all employees.

Condition 12 Records keeping
- The company keeps an active excel sheet detailing the movement of waste through the process.
- The first annual report is due March 31, 2011

2.2 FINANCIAL ASSURANCE:

Financial assurance has been received by the company.
According to Condition 1(20) the company is required to have Financial Assurance of $727, 700. Should the

company increase their Maximum Approved Waste Processing Capacity to 150, 000 tonnes they will need to increase their financial assurance to $1,018,000.

2.3 SITE SERVICE AREA:

In accordance with Condition 2(1) the site may only accept solid non-hazardous domestic, commercial, institutional or industrial Organic Waste for the Province of Ontario and Quebec limited to the Organic Waste listed in Condition 2 of the Approval.

Site observations:

The facility is currently only accepting organic waste and leaf and yard waste from the City of Ottawa waste collection program.

2.4 APPROVED SITE CAPACITY:

Tonnage records have been reviewed from January 28th, 2010 to September 18th, 2010. No exceedences were noted.

Weight of the waste received is measured by a scale located on site. The data is inputted in two computerized databases, one for Orgaworld and the other for the City of Ottawa.

The Site has never had to reject a load of waste.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

This is the first time this facility is inspected by the Ministry.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry 's mandate ?

No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?

No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?

No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?

No

Specifics:

Was there any indication of minor administrative non-compliance?

No

1.0 INTRODUCTION

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste, as defined in their waste certificate of approval, for the production of compost. The Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. Once the material remains in the tunnels long enough for the temperature to reach 55 degrees Celsius for 3 consecutive days it is cooled down, removed from the tunnels and placed into a screener which separates the material in size fractions. The screener separates the material into 100+ (which includes large pieces of material that have not composted -branches, large pieces of incidental plastic), 10-100 material (which is medium sized material), incidental waste, and compost. The 100+ material might get sent to landfill or sent back to the shredder and enter the compost stream at the front of the line. The 10-100 material is used as inoculate and mixed in with fresh material in the Mixing Hall. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the certificate of approval and then removed from the site as finished compost.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa is currently collecting the leaf and yard waste co-mingled with the SSO waste. It should be noted that the City of Ottawa started co-mingling their leaf and yard waste with the SSO organics and sending it to Orgaworld in April 2010.

The purpose of the inspection is to assess the sites compliance with their Waste Certificate of Approval (CofA) and applicable environmental legislation such as the Environmental Protection Act (EPA) and Reg 347 under that same act. The inspection consisted of a District file review, site visit and discussions with Greg Mariotti, site operations manager.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. Although the time of inspection is listed as September 20th, 2010, the information in this report is also based on site visits done at the facility throughout the year.

An air facility inspection and an industrial sewage inspection were also carried out at the site. See respective reports for details.

2.0 INSPECTION OBSERVATIONS

Certificate of Approval Number(s): ● Yes ○ No
C of A Number(s): 2766-7HEPSZ, issued September 16th, 2009

2.1 SITE OPERATION:

Throughout this inspection report, the names allocated to the different areas within the processing building are as described in Figure 5.1 from the document titled: "Application for a Provisional Certificate of Approval for a Waste Disposal Site" dated June 2008.

General site observations from Sept 20th, 2010 :

10-100 material was piled in the Truck Hall, there was also some "fresh" waste that had recently been dropped off. The fresh material appeared to consist mostly of leaf and yard waste, the odd plastic bag was noted. Fresh material was also seen piled in the Receiving and Sorting Hall, a small amount of 10-100 material was seen in the eastern corner of the Receiving Hall. The Mixing Hall was approximately 3/4 full of 10-100 material. Tunnel #4 was being emptied, the front end loader was taking material from tunnel 4 to the screener.

Orgaworld is currently operating 6 compost tunnels. At the time of inspection tunnel #4 was being emptied. Tunnels #7 and 8 are shells, one is being used to store 10-100 material the other is being used to store curing compost.

There are two operating biofilters at the site and a third shell of a biofilter tunnel. Orgaworld has installed doors on the biofilter tunnel shell and has connected duct work to create a negative pressure in the tunnel and plans on using this as storage for 10-100 material or curing compost. This biofilter shell is not currently being monitored by the SCADA system.

According to staff, the increase in leaf and yard waste co-mingled with SSO has caused some operational challenges for Orgaworld as the material does not break down as easily. As a result Orgaworld has been accumulating a lot more 10-100 material than was expected. Orgaworld is selling this 10-100 material to some farmers as mulch.

At the start of operations the amount of SSO received was, on average, approximately 82 tonnes per operating day. The City of Ottawa decided to collect the City's leaf and yard waste co-mingled with the SSO waste. This greatly increased the volume and tonnage of material received. As an example, the site received, on average, approximately 292 tonnes per operating day in June, 2010.

On my site visit of September 20th, 2010, compost was being removed for the compost Curing Hall and loaded onto a truck. The compost will be brought to Orgaworlds compost storage site located in back of 3200 Rideau Rd, Ottawa. It should be noted that, as of November 29th, 2010 there is approximately 7,600 tonnes of compost at the storage site. Orgaworld is leasing this site from Tomlinson to store finished compost until buyers are found and ready to accept the compost.

At the time of inspection, the bay doors to the Processing Building were closed with the exception of one door from the compost curing hall because compost was being removed from the hall.

There were three piles of 10-100 material located outside the facility, these piles were side by side on the eastern side of the building. The piles were outside as a result of three separate fires that occurred inside the building. There has also been a fourth fire but the material was never brought outside. The company has been instructed to remove the material once it is deemed safe. Since then the material has been removed

from the site and sold as mulch.

Observations regarding some conditions in the CofA:

Condition 2. Service area, approved waste types, rates & storage.
- It should be noted that the company has appealed Conditions 2(i) and 2(ii) of the certificate of approval to the ERT. The Tribunal has not yet made a decision.
- Tonnage records were reviewed, no non compliances were noted.
- There have been some issues with outside storage of waste on site. The company has stored material outside as a result of 4 fires that occurred during the summer. This material has since been removed and the company has submitted a detailing the events and measures taken to prevent reoccurrence.

Condition 3. Signs
- Orgaworld has posted a sign at their front gate that complies with the condition.

Condition 5 Site Operations
- According to company officials no waste has been rejected.

Condition 6 Equipment and site inspections & maintenance
- Daily site inspections are conducted and a record is produced.
- The company has not yet created and implemented a preventative maintenance program for all on -Site equipment. See Air Inspection report for further action to be undertaken.

Condition 7 Quality criteria, testing & monitoring
- Every quarter there is an audit done of incoming SSO waste with the City of Ottawa. The company also does their own sampling of incoming waste.
- Finished compost sample results were reviewed, no non compliance issues were noted.
- Monitoring of the composting material is done electronically through a SCADA system.
- The odour monitoring program was received on October 30th, 2009. Since the start up of the operation the Ministry has received 3 odour complaints for the company. While it was not possible to conclusively determine the source of the odours, it is believed that the source is the pile of finished compost being stored at the compost storage site on Rideau.

Condition 8 Nuisance impact control & housekeeping
- A pressure washer is available inside the Truck hall in the event the trucks need to get cleaned.
- The company calls in a sweeping company to clean off the asphalt parking area if and when it gets dirty.
- the company has an agreement with an extermination company to handle vermin and vector.

Condition 9 Operations manual & staff training
- The Operations manual was received October 30th, 2009.

Condition 10 Emergency response and contingency plan
- The contingency plan was received on October 30th, 2009
- The plan in kept at the front office in a cabinet and is accessible to all employees.

Condition 12 Records keeping
- The company keeps an active excel sheet detailing the movement of waste through the process.
- The first annual report is due March 31, 2011

2.2 FINANCIAL ASSURANCE:

Financial assurance has been received by the company.
According to Condition 1(20) the company is required to have Financial Assurance of $727, 700. Should the

company increase their Maximum Approved Waste Processing Capacity to 150, 000 tonnes they will need to increase their financial assurance to $1,018,000.

2.3 SITE SERVICE AREA:

In accordance with Condition 2(1) the site may only accept solid non-hazardous domestic, commercial, institutional or industrial Organic Waste for the Province of Ontario and Quebec limited to the Organic Waste listed in Condition 2 of the Approval.

Site observations:

The facility is currently only accepting organic waste and leaf and yard waste from the City of Ottawa waste collection program.

2.4 APPROVED SITE CAPACITY:

Tonnage records have been reviewed from January 28th, 2010 to September 18th, 2010. No exceedences were noted.

Weight of the waste received is measured by a scale located on site. The data is inputted in two computerized databases, one for Orgaworld and the other for the City of Ottawa.

The Site has never had to reject a load of waste.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

1.0 INTRODUCTION

For Clarity within this report it should be noted that the Ministry of the Environment has restructured their approvals process. As of October 31st, 2011, all Certificates of Approval will be referred to as Environmental Compliance Approvals (ECA).

The facility is an aerobic composting facility that is approved to accept solid non-hazardous organic waste as defined in their waste ECA for the production of compost. Organic waste is brought to the facility, shredded, mixed and placed inside composting tunnels. Conditions within the tunnels are monitored and changed to ensure optimum conditions that promote aerobic composting. The compost size material gets placed in the compost curing area where it is required to cure for 21 days, tested to ensure it meets all requirements under the waste certificate of approval and then removed from the site as finished compost. All process air and air from the receiving hall is directed through pollution control equipment. Leachate generated as a result of the composting process gets recirculated, any excess is kept in on-site storage tanks.

Orgaworld Canada Ltd. first started accepting organic material at their site on January 28th, 2010. The Site is currently only receiving waste from the City of Ottawa source separated organics (SSO) collection program and leaf and yard waste program. The City of Ottawa has been collecting the leaf and yard waste commingled with the SSO waste.

The facility is approved to operate at a production limit of up to 150,000 tonnes per year of organic waste.

The following inspection report relies on information found in the district file, site observations and information gathered from conversations with Orgaworld staff. The site visit for the inspection was

conducted on September 19th and a follow visit was conducted on September 30th to review paperwork requirements.

The purpose of this inspection is to assess the sites compliance with their Industrial Sewage Works ECA and applicable environmental legislation such as the Ontario Water Resources Act (OWRA). The inspection consisted of a district file review, site visit and discussions with Greg Mariotti, site operations manager.

An air facility inspection and non -hazardous waste transfer processing inspection were also carried out at the site. See respective reports for details

2.0 INSPECTION OBSERVATION

Facility MEWS (Works) Number:
N/A

Sector Type:
Other

Specify Other:
Composting facility

Effluent Type:
Storm Water

Receiver Type:
Surface Water

Name of Receiver:
Findlay Creek

Is there a sensitive receptor on/in the receiver?
Yes

Select the most important type of sensitive receptor.
Receiving Water

Certificate of Approval Number(s):
Yes
C of A Number(s): 7251-8GKRPD issued May 30th, 2011

The current certificate was issued to include alterations to the outdoor stormwater drainage including the addition of a submersible pump, storage tanks and aerators on the pond.

Previous ECA's:

1- # 9465-7NVRWT issued September 16th, 2009
2- # 7032-88XPRA issued September 7th, 2010 - was issued to reflect changes in the on site monitoring wells.

2.1 WASTEWATER TREATMENT PROCESS DESCRIPTION

Stormwater is collected in an on-site open ditch system leading to a stormwater management pond that discharges off site to the Hawthorne Industrial Park ditch system which eventually leads to Findlay Creek.

Process water generated inside the building gets stored in leachate holding tanks buried on the East side of the building. Should the facility need to use water in their process (wetting the

composting material) they use the leachate from the storage tanks and/or water from the stormwater pond. Should the leachate tanks need to be emptied the company has been contacting Lacombe to pick up and dispose of the leachate. The HWIN generator number for the site is ON3338779, and indicates that the leachate is classified as waste class 270L. According to company officials the facility operates in a water negative environment in the summer but has found that they collect excess leachate in the winter.

2.2 EFFLUENT SUMMARY REPORT

What are the facility's effluent limits based on?
Certificate of Approval/Permit, None

Does the facility comply with its limits?
Yes

The ECA does not refer to any exceedance limits but refers to trigger parameters. Should the stormwater exceed any of the trigger parameters it would be considered leachate contaminated stormwater and would not be allowed to be discharged from the stormwater management pond.The stormwater management pond can only be discharged when sampling shows that the water does not exceed trigger levels listed in Table 2 of the Certificate.

Table 2
Trigger Parameters

Parameter	Trigger Level (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

Condition 5(1) of the ECA requires the company to sample the effluent on a monthly basis for the parameters listed in Table 1. Results from sampling done from March to September 2011 were submitted. The following issues were noted:

- April sampling: exceedence of Total Suspended Solids
  no pH reading
- May sampling: not tested for ammonia
  not tested for nitrates
  no pH reading
- June sampling: no pH reading
- July sampling: exceedence of Ecoli

- September sampling: exceedence of Total Suspended Solids

According to file review the pond was discharged in March and April of 2011. The Ministry was contacted prior to discharge in April as the TSS trigger parameters was exceeded by 1mg/L. At the time of inspection, Greg also indicated that he plans on discharging this fall in order to ensure adequate storage space during the following spring snow melt.
See Section 5.0 Action Items

The ECA was amended on May 30th, 2011 to include the installation of aerators in the pond. These aerators were not installed at the time of inspection.

2.3 SEWAGE TREATMENT WORKS CAPACITY ASSESSMENT

Flow (m^3/day)	Year 1	Year 2	Year 3
Average daily flow	0.00	0.00	0.00
Maximum daily flow	0.00	0.00	0.00
Capacity Design	0.00	0.00	0.00
% of capacity (based on average daily flow)	0.00	0.00	0.00

The ECA does not require flow measurement nor list any design capacity. In accordance to condition 6(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation. The owner is also required to maintain a log book to record the results of these inspections.

Daily site inspection records were reviewed at the time of inspection and were found to include pond site inspection findings.

2.4 SAMPLING REQUIREMENTS

What are the facility's sampling requirements based on?
Certificate of Approval/Permit

Does the facility meet sampling requirements?
Yes

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganic**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature

Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

2.5 REPORTING REQUIREMENTS

What are the facility's reporting requirements based on?
Certificate of Approval/Permit

Does the facility meet reporting requirements?
Yes

As per condition 10(3) of the ECA the facility submitted a performance report for 2010.

2.6 FLOW MEASUREMENT

Flow measurements are not required in the ECA.

2.7 MINISTRY SAMPLE RESULTS

Were Ministry samples collected during the inspection?
No

Reason:
Facility was not discharging at the time of inspection

2.8 FINANCIAL ASSURANCE

The facility holds financial assurance in accordance with Waste ECA #2766-7HEPSZ.

2.9 SPILL PREVENTION AND CONTINGENCY PLANS

Is the facility required to have a Spill Prevention and Contingency Plan (SPCP) as required by Ontario Regulation 224/07?
No

Has the facility had any spills since the last inspection?
No

Were all the spills reported to the ministry?
N/A

Does the facility's operations or spill history suggest that a SPCP be developed?
No

Comments:
The facility has spill kits on site and has submitted a contingency plan for odours, spills, fires, power failures and labour disruptions.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

The company has received an amendment to their ECA reflecting the alterations seen during the previous inspections. The Company has also disconnected their sump pump therefore no longer potentially requiring a permit to take water.

4.0 SUMMARY OF INSPECTION FINDINGS

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?

No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material?

No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment?

No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material?

No

Specifics:

Was there any indication of minor administrative non-compliance?

Yes

Specifics:

Insufficient stormwater effluent monitoring.

5.0 ACTION(S) REQUIRED

1. Submit a report on the effluent monitoring explaining why the parameters noted in Section 2.2 of this report were not sampled for.

Submit all information required above to

Dear Sir:

RE: Implementation of Ontario Compost Quality Standards – Maturity & Foreign Matter
Orgaworld Ottawa Facility, 5123 Hawthorne Road, Ottawa
Environmental Compliance Approval No. 2766-7HEPSZ

On July 25, 2012 the Ministry of the Environment and Climate Change (MOECC) released revised standards for aerobic composting of organic waste materials in the province of Ontario entitled *Ontario Compost Quality Standards* ("Standards"). The Standards update and replace the *Interim Guideline for the Production and Use of Aerobic Compost in Ontario*, first released in November 1991, and last updated in 2004.

The Standards outline new categories of compost (AA, A, and B) with specific requirements for metals, quality of feedstock, pathogens, foreign matter and maturity. The MOECC implemented Phase I (metals, quality of feedstock and pathogens) of the Standards on January 1, 2013 with Phase II (maturity and foreign matter) to be implemented on July 1, 2015.

In preparation of the upcoming implementation date, the MOECC would like to engage Orgaworld Canada Ltd. in how the requirements of the Standards will be met.

By **May 1, 2015**, please submit an action plan outlining how the Orgaworld Ottawa Facility will comply with the implementation of Phase II of the Standards on July 1, 2015. The action plan should include, but not necessarily be limited to, the following:

1. Process and/or operational changes to the current operations at the Orgaworld Ottawa Facility that may be necessary;
2. Environmental Compliance Approval amendments required to reflect any required process changes or modifications;
3. Options to manage processed organic waste not meeting the *Ontario Compost Quality Standards*; and
4. Timelines associated with the actions necessary for the Orgaworld Ottawa Facility to be compliant with the Phase II *Ontario Compost Quality Standards*.

Please contact me if you have any questions or concerns with the above request and the implementation of Phase II of the Standards. A meeting can be arranged in the event Orgaworld Canada Ltd. would like to discuss this subject in further detail.

Sincerely,

Kyle Straberger

Kyle Straberger
Environmental Officer

Soil Management in Ontario

Internal Questions and Answers

July 18, 2014

Key Messages:

- Creating opportunities to build or renew infrastructure and redevelop brownfields sites benefits Ontario's economy. Effective, sustainable soil management practices are important to maintaining a healthy economy and environment.
- The Ministry of the Environment and Climate Change encourages the reuse of excess soil for beneficial uses as long as it can be done in a way that protects human health and the environment.
- The ministry has finalized a best practices guide for how to manage excess soil on large-scale projects to help provide clarity to site owners, developers and contractors and promote a consistent approach.
- While municipalities and Conservation Authorities are the main permitting agencies for soil management activities, the ministry is helping by releasing a guidance document that outlines best management practices for managing excess soil.
- The ministry consulted extensively with the public and stakeholders and carefully considered the feedback received through the Environmental Bills of Rights Registry prior to finalizing the guide.
- The Best Management Practices provides essential guidance on many aspects of excess soil management. Going forward, we will be reviewing the need for further policy for managing soil in ways that ensure public health and the environment are protected.

Questions and Answers for the District/Area Offices:

Enforcement

1. How will ministry staff enforce the Management of Excess Soil – A Guide for Best Management Practices?

Currently all soil management activities brought to the ministry's attention are assessed on a. case-by-case basis, using site specific information. The applicability of the guide will also be assessed on a case-by-case basis.

If the ministry determines there is a potential environmental concern, the ministry will examine each situation to understand how the guidance was applied or how it can be applied to the specific site.

District Engineers or Regional Technical Support staff may need to be consulted to assist in determining and/or verifying (based on the information that is provided by the Qualified

Person) if there is a potential for, or a confirmed adverse effect, associated with the excess soil management activity.

If there is a confirmed or potential for an adverse effect, ministry staff will ensure the site owners take appropriate actions to mitigate the impacts using the ministry's Compliance Policy – Applying Abatement and Enforcement Tools (May 2007).

2. **What tools are available to enforce the Management of Excess Soil – A Guide for Best Management Practices?**

All current abatement tools, such as both voluntary and mandatory abatement, following the ministry's Compliance Policy and Informed Judgement Matrix are available to Environmental Officers to address non-compliance situations.

If voluntary or mandatory abatement tools, such as letters or Orders are used to follow up on, or address issues or concerns regarding excess soil management activities, Environmental Officers are encouraged to incorporate language from the guide, as appropriate.

This will ensure a consistent approach is being utilized by District/Area offices across the province.

3. **Can an Environmental Officer order someone to follow the Management of Excess Soil – A Guide for Best Management Practices, or reference the document in an Order?**

Management of Excess Soil – A Guide for Best Management Practices is a guidance document that highlights the ministry's expectations of stakeholders when they are engaging in excess soil management activities from large-scale projects. While these expectations were created to help ensure compliance with ministry legislation, the document itself is not legally enforceable.

The authority to issue an Order is still dependent upon identifying legislative contraventions based on site specific information, or the need for preventative measures. The language and concepts found in the guide can be incorporated into an Order, but only in instances where the site specific information establishes the context for incorporating the guidance into that Order.

Generally there are three legislative areas that can address concerns regarding excess soil management activities:

- Contraventions of the general prohibition clauses for the discharge or presence of contaminants in the natural environment that cause or may cause an adverse effect under the Environmental Protection Act and Ontario Water Resources Act;
- Preventative measures to ensure there is no future adverse effect (under the Environmental Protection Act); and
- Contraventions of the general waste management provisions found in O. Reg. 347, General Waste Management Regulation and the Environmental Protection Act.

District/Area Offices can consult the Central Region Program Services Unit or their

Regional Counsel for advice when taking compliance actions or referencing the guide within an Order.

4. Can the ministry order a landowner to get a Record of Site Condition if they have received soil at the site?

Records of Site Condition are only required when a property is changing to a more sensitive property use. The ministry does not order landowners to obtain a Record of Site Condition unless it is legally required under the *Environmental Protection Act*.

Managing Soil as a Waste

5. When should excess soil be managed as a waste?

The determination of whether excess soil should be managed as a waste can only be made on a case-by-case basis.

For excess soil that is being transported from a ministry-approved waste management site (such as a transfer / processing site or soil remediation facility), the Environmental Officer should refer to the site's Environmental Compliance Approval for conditions related to where the excess soil can go when it leaves the site.

If soil is found to be inappropriate for re-use at a site or the excess soil has no beneficial re-use and is destined for final disposal, the soil should be managed as a waste.

The Management of Excess Soil – A Guide for Best Management Practices provides stakeholders with the best management practices the ministry considers reasonable for managing excess soil as a resource.

If it is unclear whether a proponent is managing excess soil in accordance with the guide, your District/Area Office management team and the Central Region Program Services Unit can assist in determining if the soil from a site is being managed in an appropriate manner.

Temporary Soil Storage and Receiving Sites

6. What procedures should the District/Area Office follow related to a proponent establishing a Temporary Soil Storage Site?

Before a District/Area Office offers guidance to a proponent planning to establish a Temporary Soil Storage Site, the proponent should confirm that they have already contacted the appropriate permitting body, such as the municipality or conservation authority.

The permitting authority will advise the proponent whether the proposed site is appropriate for use as a Temporary Storage Site, and may also suggest or provide the proponent with site-specific conditions.

If the permitting authority is satisfied with the establishment of the site, the ministry should direct the proponent to follow the Management of Excess Soil – A Guide for Best

Management Practices for the operation of the site.

If appropriate, ministry staff can issue a preventative measures Order under Section 18 or 157.1 of the Environmental Protection Act to establish the conditions of the site so that they can be legally enforced. Prior to using an Order, ministry staff should consult with Regional Counsel.

7. How can the ministry establish financial assurance for Temporary Soil Storage Sites and Receiving Sites?

If the ministry determines that financial assurance is required, the District or Regional Office can issue an Order under *the Environmental Protection Act*. The Order should take into account the specific characteristics of the site to determine the amount of financial assurance required.

Risk Assessments

8. Is a risk assessment required for a proponent to assess the quality of soil being received at a site?

No, a risk assessment is not required for all sites receiving soil.

A Qualified Person is hired to make decisions for excess soil management and should be someone who can exercise professional judgment based on their experience. This is so that they can advise on appropriate reuse options for the excavated or excess soil, based on the appropriate soil analysis and characterization.

If the risk assessment is to be conducted and a Record of Site Condition is filed, the guide does not apply, and the soil management requirements highlighted under Part XII of Ontario Regulation 153/04 take precedent.

District/Area Office Training

9. Will there be any additional support and training for ministry staff related to the Excess Soil Management – A Guide for Best Management Practices?

Please contact Jonathan Fernandes, Central Region Program Services Unit at 416-326-5686 or jonathan.fernandes@ontario.ca for further assistance, clarification and interpretation of the document.

Central Region's Program Services Unit staff offer training sessions coordinated through the District/Area Office management teams. Contact your local District/Area Office for more information.

District/Area Office

1. What is included in the Excess Soil Management – A Guide for Best Management Practices?

While municipalities and Conservation Authorities are the main permitting agencies for soil

management activities, the ministry has developed a guide that highlights best practices for excess soil management activities.

The document provides guidance on how to handle excess soil generated from large-scale projects that is transported to sites where it can be reused for a beneficial purpose.

Excess soil management options in the guide include:

- direct reuse at the site where the soil was excavated
- on or offsite treatment of soil for reuse
- reusing excess soil at a construction or development site where imported soil is required for purposes such as site alteration, filing in depressions/excavations or re-grading
- managing excess soil at a ministry-approved soil recycling, processing or treatment facility
- reusing excess soil at a commercial fill site; or
- use as daily cover at a ministry-approved waste disposal site.

2. Why did the government develop the new guidance?

The guide was developed in response to concerns from stakeholders such as municipalities, conservation authorities, the construction industry, environmental consulting firms, and environmental non-governmental organizations.

While municipalities and Conservation Authorities are the main permitting agencies for soil management activities, the ministry has developed a guide that highlights best practices for excess soil management activities.

The guide will assist in establishing a consistent approach to managing excess soil for beneficial uses as well as avoid unnecessary disposal of soil in landfills.

3. What will change from what's currently being done?

The ministry provides guidance on excess soil management activities on a case-by-case basis.

The Best Management Practices guide details the ministry's expectations for those who manage excess soil to help ensure a consistent approach across the ministry.

The guide also encourages reuse for beneficial purposes to prevent excess soil from being unnecessarily disposed of in landfills.

4. Who will be affected by the proposed new soil management guidance?

Anyone engaging in excess soil management activities is responsible for ensuring excess soil is managed in an environmentally sound manner and according to all regulatory requirements. This includes municipalities, developers and owners of source and receiving sites.

5. How will the Best Management Practices help industry involved in the redevelopment of a site?

The Best Management Practices guide details the ministry's expectations for those who manage excess soil to help ensure a consistent approach across the ministry. The document can be used by site owners, developers and contractors as well as municipalities, government ministries and agencies.

The guidance document may help industry reduce trucking and disposal costs in the longer term by encouraging beneficial reuse of excess soil rather than disposal in landfill sites.

Municipalities and Conservation Authorities are encouraged to incorporate these best practices when issuing permits and approvals to assist those managing excess soil in a consistent manner.

6. Why does the Excess Soil Management – A Guide for Best Management Practices focus on large-scale projects when the majority of soil management in Ontario is related to small-scale projects?

The proposed best management practices are not intended to apply to:

- small-scale construction projects, such as small parking lots, recreational paths, and playgrounds.
- maintenance and construction activities at single-dwelling residential properties such as building a swimming pool or landscaping activities; or
- activities associated with small-scale municipal road work or sewer and water main construction such as minor or localized repairs of underground utilities.

Anyone can use the Best Management Practices concepts for construction projects that generate excess soil. Homeowners are not expected to incur the cost of retaining a Qualified Person for small-scale projects. That is why the focus is on large-scale projects.

7. Why isn't the government developing a full policy to address all soil management activities in Ontario?

The Best Management Practices guide is intended to advise municipalities and others on the types of requirements to be considered when developing provisions for managing excess soil.

This guidance can be used to inform municipal by-laws, municipal site alteration permits and contracts involving the movement of excess soil.

The ministry also will review the need for further policy for managing excess soil in ways that ensure public health and the environment are protected.

Municipalities and Conservation Authorities have the authority to develop by-laws and issue permits for soil management activities.

8. How will the ministry encourage use of the best management practices?

While drafting the best management practices, the ministry consulted a broad range of stakeholder groups including municipalities, roads associations, waste associations, the engineering community and developers.

The ministry will encourage the use of these best practices by posting of our guide on our ministry website and outreach activities with anyone who is involved in soil management. We will also coordinate an implementation plan that includes compliance information and additional guidance and support.

The ministry will provide support to stakeholders to ensure the best management practices guide along with any relevant ministry legislation is being interpreted and applied appropriately. This includes the potential for ministry staff to conduct site visits at construction sites where excess soil is being generated.

9. When will a broader policy framework for soil management be developed?

We will be reviewing the need for further policy for managing soil in ways that ensure public health and the environment are protected.

In the meantime, the ministry encourages the use of the Best Management Practices guide for anyone involved in managing excess soil.

Any future policy development will build on the best management practices, what we heard when we consulted on it, and ongoing engagement with the public, stakeholders and other ministries.

10. Who enforces soil management?

In most cases, municipalities and conservation authorities oversee soil management by issuing permits and approvals to assist those managing excess soil in a manner consistent with the rules of the jurisdiction.

They also enforce compliance with the permits and approvals they issue.

11. How will the new Best Management Practices for soil management be enforced?

The Best Management Practices document sets out the ministry's expectations for managing excess soil generated from large-scale projects.

Where environmental concerns are identified at a site, the ministry may assess all soil management activities. This includes those occurring at the excavation site, during transportation or at sites where the soil is received. The ministry may take action as required.

Anyone handling excess soil must meet all current provincial laws as they apply, as well as any applicable bylaws and permitting requirements established by local municipalities and/or conservation authorities.

These best practices are intended to complement existing approvals under

provincial legislation and municipal bylaws.

Municipalities and Conservation Authorities are encouraged to consider the concepts set out in the guide when issuing permits or licenses, or establishing soil management by-laws or policies, and to make use of them as appropriate. Municipalities and Conservation Authorities may also initiate their own compliance activities based on their jurisdictional authority.

12. Who is responsible during the planning stage of a project?

Municipalities have the authority to determine where soil can be used in their jurisdictions.

Soil conservation and management should be integrated into all aspects of the planning and development process, from the initial concept through permitting, construction, transportation and reuse of excess soil.

The ministry encourages municipalities, conservation authorities and other regulatory bodies to address soil management activities from a planning perspective to complement these best management practices.

13. Why has the ministry accepted to undertake a review of the need for additional policy related to the management of compromised soil?

The ministry has developed the Best Management Practices guide to encourage a consistent approach to the management of excess soil. The ministry will be reviewing the need for further policy for managing soil in ways that ensure public health and the environment are protected. This review will build on the Best Practices, assessing the need for additional policy to support implementation of soil management in a manner consistent with the recommendations set out in the Best Practices guide.

14. Will additional guidance be available?

The ministry is coordinating an outreach and implementation plan that will include additional support and guidance for anyone involved in or responsible for managing excess soil.

The ministry is also supporting industry as they lead the development of complementary industry codes of practice for their sector.

The ministry will also be seeking opportunities to work with stakeholders to develop and promote the best management practices.

15. Does the Best Management Practices Guide consider invasive species?

The guide highlights that considerations should be given to controlling the introduction and spread of invasive species during all excess soil management activities. Please refer to the Ontario Invasive Species Strategy Plan 2012 and the Ontario Invading Species Awareness Program developed by the Ministry of Natural Resources and Forestry for more information.

16. Does the Best Management Practices Guide include compost?

Compost does not meet the definition of soil as described in the guide and is not intended to be addressed by these best management practices. The ministry has developed Compost Quality Standards and a Guideline for the Production of Compost in Ontario that includes best management practices.

17. When will the ministry address other soil management issues, including road building, pits and quarries?

These specific issues require longer-term consultation and policy development involving other ministries and jurisdictions.

For example, the Ministry of Natural Resources regulates quarries and gravel pits in Ontario. The ministry provides input to the Ministry of Natural Resources on how these materials can be managed on a case-by-case basis. Soil management activities at road construction projects may involve both the municipalities and the Ministry of Transportation. These activities will also be reviewed by the ministry on a case-by-case basis.

18. Why isn't Ontario adopting a soil mapping and soil reuse strategy to promote soil banking like the Netherlands?

The Netherlands has a regulatory framework for soil management which provides clear rules for where excess soil can be placed. The country is divided or mapped out into "soil zones" that allow soil to be moved within its zone so that the same types of soil remain within their specified zones. The Netherlands is not comparable to Ontario with respect to size or geography or the history which lead to their comprehensive soil policy.

The ministry wants to see excess soil put to beneficial uses where possible and not end up in landfill sites. That is why we are providing the Best Management Practices guide to stakeholders.

Soil banking is considered an option for soil management. Considerations for soil mapping may be discussed as part of a broader policy review related to soil management.

19. Does the proposed Best Management Practices document provide standards for receiving soil?

The Best Management Practices provide guidance for Qualified Persons to determine whether the excess soil is suitable for reuse or disposal. This is based on a site-specific evaluation of the receiving site by the Qualified Person to determine what concentration of contaminants is appropriate.

20. How will the Best Management Practices help landowners receiving excess soil such as municipalities?

The Best Management Practices guide requires a Qualified Person to oversee excess soil management activities at the source site. This will help ensure that soil going to receiving sites is of acceptable quality and will not cause an adverse effect in the local community.

Municipalities can use the Best Management Practices for their procurement activities. This includes road building and issuing approvals or permits.

21. How is "soil" defined in this guidance? Does this apply to asphalt and concrete or other aggregate products?

Soil is defined as naturally-occurring mineral particles and material resulting from the natural breakdown of rock or organic matter. The soil particles are smaller than two millimeters, or pass the U.S. Number 10 sieve.

The guide is not intended to apply to other materials such as engineered fill products, asphalt, concrete and reused or recycled aggregate products.

22. Why doesn't the ministry just refer to the existing standards? What is the difference?

Generic brownfield standards were developed using technical assumptions in order to meet specific objectives, for the filing of a Record of Site Condition.

Ontario's brownfield standards are not intended to address overall soil management activities in Ontario. They were created using scientific models and a policy framework designed for the clean-up of brownfields. There are several factors used in the development of these standards that do not apply to the management of excess soil. These standards may not be appropriate for overall soil management and would require a site specific evaluation to determine their appropriateness.

The best practices provide guidance to Qualified Persons on the considerations that must be taken into account when applying these brownfields standards to overall soil management activities, such as assessing the acceptability of the use of the standards at sites receiving excess soil.

23. How much time/effort is needed to develop soil management standards?

Developing new standards requires clear policy objectives and principles, in addition to the time required to undertake a sound scientific process. The development of standards also requires time to consult extensively with stakeholders.

The ministry will examine options for the development of standards as part of the review for the need for further policy for managing soil in ways that ensure public health and the environment are protected.

In the meantime, the ministry has developed the best practices guide for managing excess soil on large-scale projects to promote a consistent approach by site owners, developers and contractors.

24. Why doesn't the Best Management Practices make specific reference to the

assessment of soil types at receiving sites to see if they are appropriate for reuse?

The Best Management Practices guide advises that all assessment work should be conducted by a Qualified Person.

Qualified Persons have the expertise to determine when soil brought to the property is appropriate for reuse and does cause an adverse effect. The Qualified Person's assessment would also examine the compatibility of soil types as part of their standard assessment work.

The Qualified Person may need to consult with other experts to decide on the intended beneficial reuse of soil, such as an agrologist if soil is to be used for an agricultural purpose.

25. Why doesn't the guidance in the best practices reflect Ontario's brownfields regulation?

Ontario's brownfields legislation applies to sites that are being redeveloped to a more sensitive property use, such as a former industrial site being redeveloped for a new residential subdivision.

The regulatory framework and standards under the brownfields legislation were developed to ensure the site is appropriate for the intended new property use, and was not intended to apply to overall soil management activities.

Sites that are accepting excess soil and are planning to submit a Record of Site Condition for filing under the brownfields legislation must follow the soil management provisions within that legislation.

The best management practices are not legal requirements and do not apply to anything related to the filing of a Record of Site Condition.

26. Are there areas in the ministry where placing soil should be banned (e.g. Oak Ridges Moraine)?

The ministry encourages the reuse of excess soil for beneficial uses as long as it can be done in a way that protects human health and the environment.

Placing large amounts of excess soil should be done knowing where the soil came from, the quality of that soil and whether that quality of soil is appropriate for the location at which it is being placed. There should be no adverse effect on the site where the soil is placed.

The ministry will continue to work with stakeholders to advise on managing excess soil, including near environmentally sensitive areas. Decisions on where excess soil can be reused will be made on a case-by-case basis.

27. Why doesn't the ministry stipulate where soil can go?

The placement of excess soil may be subject to a number of restrictions imposed by the

ministry, a municipality, conservation authority or as a result of contractual arrangements.

Depending on the circumstances, the province's waste management provisions or regulations for the redevelopment of brownfield sites will apply.

Municipal by-laws may further restrict where and what quality of soil is placed at a property, and Conservation Authorities further regulate site alteration within their regulated areas. It is also appropriate for the receiving property owner to understand the quality of soil received and to ensure that no adverse effect results.

The ministry encourages the reuse of excess soil in a sustainable manner. The ministry has developed a Best Management Practices guide to help those who generate or receive soil decide on how best to manage that excess soil.

28. Will the government allow there to be a certain level of contamination on clean properties as part of a soil management policy?

The Best Management Practices guide advises that assessment work should be conducted for each receiving site by a Qualified Person.

Qualified Persons have the expertise to determine that the excess soil brought to the property is appropriate for reuse and will not cause an adverse effect to the property.

The Qualified Person's assessment would include soil quality and compatibility of soil type as part of their standard assessment work.

In general, those managing excess soil should seek out sites that are of compatible land-use types. Where possible, those managing excess soil should avoid the introduction of new contaminants at the receiving site and take measures to avoid increasing the concentration of an existing contaminant at a receiving site.

29. Provinces like Quebec mandate soil treatment prior to reuse. Why doesn't Ontario do the same?

The ministry encourages soil treatment if necessary to enable excess soil to be reused. The ministry will continue to promote innovative approaches to soil treatment.

30. Why doesn't the ministry ensure that municipalities use a consistent approach?

While the ministry is not developing a model by-law, the best practices are intended to complement municipal by-laws, such as site alteration, noise and traffic by-laws.

Municipalities are encouraged to consider the concepts set out in the best practices when issuing permits or licenses, or establishing by-laws or policies for soil management, and to make use of them as appropriate.

31. What's wrong with sending soil to landfill? Can't it be used as cover?

Yes – some excess soil can be used by landfill sites as cover material. The ministry is encouraging the reuse of excess soil to keep soil that can be reused from taking up space in landfill sites.

The ministry encourages the reuse of excess soil for beneficial uses as long as it can be done in a way that protects human health and the environment.

32. What's wrong with accepting a small amount of soil on my farm property if it does not cause an adverse effect?

The ministry encourages the reuse of excess soil provided that its reuse does not cause an adverse effect or impair water quality. Placing a small amount of soil on farm property is acceptable as long as the quality is appropriate and it does not cause an adverse effect.

Property owners accepting soil should consult their local municipality to determine if a permit is required.

Property owners may also consult qualified professionals to help determine the soil quality is appropriate for their property.

33. What are the next steps?

The Best Management Practices guide is available through the ministry's website. The ministry will support the guide with an implementation plan, and will work with municipalities, developers, industry associations and Qualified Persons to provide additional guidance and oversight.

In addition, the ministry will be reviewing the need for further policy for managing excess soil in ways that ensure public health and the environment are protected.

Qualified Persons

34.What is a "Qualified Person"?

Qualified Persons are defined under the ministry's brownfields legislation and are generally professional engineers and geoscientists. They are licensed under the *Professional Engineers Act*, or are members of the Association of Professional Geoscientists of Ontario.

A Qualified Person who is hired to make decisions for excess soil management should be someone who can exercise professional judgment based on their experience. This is so that they can advise on appropriate reuse options for the excavated or excess soil, based on the appropriate soil analysis and characterization.

35. What criteria are Qualified Persons using?

Qualified Persons use their professional expertise and judgment to determine the most appropriate criteria for a site on a case-by-case basis.

36. Can a Qualified Person assess a property they own or are engaged in?

Qualified Persons should not assess properties that they or their employers have a direct or indirect interest in, as this would be a conflict of interest.

37. Will the cost of ensuring that soil is tested and Qualified Persons are involved deter proponents of development projects from building in Ontario and cost Ontario jobs?

The initial short-term costs for work done at the source site may be balanced against the longer term reduced costs for trucking and shipping excess soil to landfill, especially if the excess soil can be temporarily stored or reused for beneficial purposes.

By following the best practices guide, the development community will also avoid the risk of incurring costs to address improper soil management activities.

38. What types of soil does the Best Management Practices guide address? Who determines that?

It is the responsibility of all parties who excavate, transport, receive or store excess soil to ensure that the excess soil is being managed in an environmentally sound manner in accordance with all regulatory requirements.

The guidance sets out the ministry's expectations for all those managing excess soil to support safe and sustainable soil management and reuse while promoting consistency across the province.

Fill Sites in Ontario

39. Doesn't this guidance actually encourage contamination of commercial fill sites receiving excess soil?

Commercial fill sites are permitted through local municipalities or conservation authorities.

It is the responsibility of all parties who excavate, transport, receive or store excess soil to ensure that the excess soil is being managed in an environmentally sound manner in accordance with all regulatory requirements.

The guidance sets out the ministry's expectations for all those managing excess soil to support safe and sustainable soil management and reuse while promoting consistency across the province. This includes best practices that can be applied to a commercial fill site.

Municipalities and Conservation Authorities are encouraged to incorporate the best practices when issuing permits and approvals to assist those managing excess soil in a consistent manner.

40. Why isn't the ministry taking stronger action in regulating fill sites?

Many municipalities and conservation authorities have permitting requirements for fill

sites. Municipalities and Conservation Authorities are encouraged to incorporate the best practices when issuing permits and approvals to assist those managing excess soil in a consistent manner.

If environmental concerns are identified at a site, the ministry may assess all activities related to excess soil management, including those occurring at a fill site and may take appropriate actions when necessary under the ministry's legislative mandate. This may include issuing orders.

41. Some municipalities are including the ministry's soil standards in their fill permits, such as Table 1 and Table 2, but it's not consistent. Why doesn't the ministry just tell municipalities what standards to use?

Some municipalities refer to Table 1 and Table 2 from the ministry's brownfields standards in their fill permits. However, the brownfields standards are not intended to address overall soil management activities in Ontario.

Rather than focus solely on standards, the ministry has developed a Best Management Practices Guide. The guide details the ministry's expectations for municipalities and others who manage excess soil. This will help ensure a consistent approach to managing large-scale construction projects. It will also encourage reuse of excess soil for beneficial purposes while providing flexibility at the local level.

The ministry will also be reviewing the need for further policy for managing excess soil in ways that ensure public health and the environment are protected.

42. The Ministry of Natural Resources requires only Table 1 soils to be used to rehabilitate former pits and quarries. Why doesn't the Ministry of the Environment and Climate Change use Table 1 standards in the Best Management Practices?

Table 1 is part of the Ministry of the Environment and Climate Change's brownfields legislation. It represents the background concentrations of metals and other substances in typical Ontario soil not affected by industry or other sources of contamination. It is intended to be applied to brownfields sites planned for redevelopment.

The Ministry of Natural Resources applies this standard as part of its legislation and policies used to rehabilitate former pits and quarries. It would be best to contact the Ministry of Natural Resources for further information on their specific legislation and policies.

The ministry supports the beneficial reuse of excess soil to help prevent the unnecessary disposal of excess soil in landfills. The use of only Table 1 for all soil management activities may limit the amount of excess soil that can be reused in an environmentally sustainable way. Discussions like this will be part of the broader review of soil management policy options.

43. Will the ministry place a moratorium on fill sites while consulting on the proposed guidance?

No. We have developed the Best Management Practices to clarify the rules and

requirements related to key excess soil management activities in Ontario.

When the ministry receives information about a site that may be causing an environmental impact, the ministry will follow up to make sure the environment is protected.

44. How can residents living near fill sites be sure their drinking water is safe?

When the ministry receives information about a site that may be causing an environmental impact, it will follow up to make sure the environment is protected. If you have concerns, contact your local ministry office.

45. What is being done to ensure soil coming into a commercial fill site is free of contaminants?

The agency that grants the permit to the site operator (such as the municipality or conservation authority) can hire a Qualified Person to determine what soil is suitable for the site.

The ministry will take action as required to make sure fill operations do not have the potential to cause an adverse effect.

46. What happens to soil that exceeds the brownfields standards?

The brownfield standards are not intended to address overall soil management activities. For example, the brownfield standards are based on assumed contaminant volumes and loadings and do not account for wide variance in soil volume and contaminant loadings which may occur with general soil management.

When considering the applicability of the brownfields standards for use at a particular site, it is important to note that elevated concentrations of contaminants when compared to the standards do not necessary imply that:

- there is a risk to human health or the environment;
- remediation is required; or
- excess soil should be considered a waste.

An elevated concentration when compared to the standards may suggest that additional site-specific studies, evaluations or assessments are warranted. These additional site-specific studies, evaluations or assessments should, at a minimum, be done in accordance with the best practices.

47. What powers do municipalities have to address soil management?

Municipalities are accountable and responsible governments and have the authority to regulate fill based on local needs.

The *Municipal Act*, 2001 provides municipalities with authority to prohibit or regulate the

placing or dumping of fill, removal of topsoil, alteration of the grade of the land and to establish fees and charges for its services and activities. Municipalities are using this authority to require studies, permits and conditions.

The *Planning Act* provides the legislative framework for municipalities to regulate the uses of land, buildings and structures. The *Planning Act* also provides municipalities with the authority to require that soil management reports be included, in certain circumstances, as part of the information and material to support an application when planning approvals are sought in respect to a development proposal.

48. What is an adverse effect?

As defined in the *Environmental Protection Act,* adverse effect refers to:

- Impairment of the quality of the natural environment for any use that can be made of it;
- injury or damage to property or to plant or animal life;
- harm or material discomfort to any person;
- an adverse effect on the health of any person;
- impairment of the safety of any person;
- rendering any property or plant or animal life unfit for human use;
- loss of enjoyment of normal use of property, and
- interference with the normal conduct of business.

49. Who will provide oversight for temporary soil storage sites?

In most cases, municipalities and Conservation Authorities would oversee Temporary Soil Storage Sites by issuing permits and approvals to assist those managing excess soil in a manner consistent with the rules of the jurisdiction.

They also enforce compliance with the permits and approvals they issue.

50. Is the government considering the development of a model by-law?

While a model by-law is not being considered at this time, municipalities are encouraged to consider the concepts set out in the guide when establishing soil management by-laws where appropriate. The ministry will also provide support to any municipality seeking to develop a by-law based on the concepts found in the guide.

51. How will the ministry ensure that anyone who establishes Temporary Soil Storage Sites won't abandon these sites and leave potentially contaminated soil piles behind?

Temporary soil storage sites must have the appropriate approvals issued by the municipality or the conservation authority. This includes ensuring the site is appropriately zoned for this use.

If environmental concerns are identified at a site, the ministry may assess all activities related to soil management, including those occurring at a commercial fill site. The ministry may take appropriate action as necessary, including issuing orders.

Inspection Follow-up Email - Information Request

Straberger, Kyle (MOECC) <Kyle.Straberger@ontario.ca>

Fri 2018-03-16 2:30 PM

To: David Veinot <dveinot@orgaworld.ca>; Brian Begg <bbegg@orgaworld.ca>; Andre Boucher <aboucher@orgaworld.ca>;

Hi Andre, David and Brian,

Thank you for your time and cooperation during the ministry's inspection of the Orgaworld Ottawa Facility. As discussed during the inspection, please provide the following information as part of the inspection:

1 - Training Protocol for employees including re-training
2 - 2017 Mass Balance
3 - Sample results for the 2017 operating year including off-site discharge
4 - Operation and Maintenance Manual records:
  - 6i ○ Copy of the Operation and Maintenance procedures for the bioscrubber and biofilters
  - 6ii ○ Inspection, repair and maintenance records for each for the following dates (date includes daily, weekly, monthly, quarterly)
    - January 18th, 2017, March 15th, May 1st, July 3rd, September 29th, November 30th
  - 6iii ○ Process data for bioscubber and biofilters for the dates outlined above
5 - Confirm copy of original ESDM report that accompanied ECA No. 1631-A2ELCQ
6 - Confirm copy of original Acoustic Assessment report that accompanied ECA No. 1631-A2ELCQ
7 - Complaint protocol for receiving and responding to complaints from the public (ECA No. 1631-A2ELCQ)
- Sampling results for the 2017 operating year, including off-site discharge, from the industrial sewage works

Let me know you if you have any questions.

Thanks,

Kyle Straberger

Environmental Officer

Ministry of the Environment and Climate Change

Ottawa District Office

Please consider the environment before printing this email.

8.0 COMPLAINT RESPONSE PROTOCOL

If complaints are received in relation to the Site or Site operations, information pertaining to the complaint will be recorded and a response protocol will be initiated in three steps as per the C of A (Air) as follows:

Step 1: Record of Complaint

The information collected regarding the complaint will be:

- Contact information of the complainant
- Time, date, and location of the complaint
- Complainant's identification of the characteristics of the odour and any information indicating relative strength compared to other events
- Operational activities during the time of the complaint
- Wind direction, weather conditions, and temperature

To gather additional information regarding the characteristics of the odour source, the Site Manager will ask for permission of the complainant to send Site personnel to the location of the complaint to provide additional characterization of the odour source. This is a component of the Complaints Response Protocol developed for two reasons: to validate the odour as originating from the Facility and, if this validation is provided, to assess the likely source of the odour from the Facility. This will facilitate identification of Facility components that are potentially responsible for the odour emission. Complainants will also be invited to visit the Site to allow them to see and smell the Facility's operations and more accurately provide feedback.

When the odour issue is resolved, the Site Manager will fully investigate the situation and determine procedures to be enacted to prevent reoccurrence. All newly implemented procedures will be fully communicated to Site employees.

Step 2: Investigation and Handling of Complaint

The following outlines the procedure for notifying the MOE of odour and noise-related issues. All events in relation to odour and noise that are beyond the normal operating conditions are recorded. These records are available to the MOE upon request. The MOE District Manager will be immediately notified in case of a situation that could potentially lead to significant increases in odour and noise generated.

In case of process discrepancies, the following procedures are adhered to:

Extent of Process Aberration	*Notifying Procedure*
Aberrations which are: not influencing processing ability; and do not cause significant increase of odour and noise generated.	Event and responsive actions recorded in Site logbook or electronic file Immediately informed are: Facility Site Manager
Aberrations which may: potentially lead to significant increase of odour and noise generation	Event and responsive actions recorded in Site logbook or electronic file Immediately informed are: Facility Site Manager Senior Operations Manager MOE District Manager

Each complaint will be recorded using a computerized tracking system and will include the following information:

- Name, address, and telephone number
- Time and date of complaint
- Waste management activities undertaken at time of complaint
- Details of complaint
- Actions taken to remediate the cause of complaint
- Proposed actions to be taken to prevent reoccurrence in future

A record of all activities taken to mitigate the odour source will be recorded. All procedures developed to prevent reoccurrence will also be recorded.

The MOE Ottawa Regional Office will be notified of a complaint made by a member of the public. All appropriate steps will be taken to eliminate the cause of the complaint and to prevent reoccurrence.

As per C of A (Waste Disposal Site) requirements, a designated representative will be available to receive complaints 24 hours per day, 7 days per week. Information regarding this hotline will be displayed on signage at the entrance to the Facility. The MOE's Spill Action Centre will be notified immediately of all complaints received at the Site. Upon successful resolution of the complaint OCL will within 3 business days provide, a written

report to the District Manager identifying the source of complaint and details of what action was taken to rectify problem and prevent recurrence.

Step 3: Suspension of Operation

OCL acting on orders from the District Manager will suspend the receipt of organic wastes and/or suspend operations of the Facility in conjunction with the Emergency Response and Contingency Plan should the District Manager deem this action to be required to satisfy an occurrence of valid and substantiated odour complaints.

Emission Summary and Dispersion Modelling Report

Orgaworld Canada Ltd
Ottawa, Ontario

ORIGINAL 2014 ECDM
ON FILE AT FACILITY

Conestoga-Rovers & Associates
651 Colby Drive
Waterloo, Ontario N2V 1C2

May 2014 • 045804 • Report No. 51

Partners in Sustainability

Executive Summary

This Emission Summary and Dispersion Modelling (ESDM) Report was prepared to support an Application for Renewal of Environmental Compliance Approval (ECA) (Air). The Facility is currently operating under ECA (Air) No. 7021-7HQNDE. The ESDM Report was prepared in accordance with s.26 of O. Reg. 419/05 to support the ECA (Air) Application. Guidance in the Ministry publication "Procedure for Preparing an Emission Summary and Dispersion Modelling Report" dated March 2009 (ESDM Procedure Document) was followed as appropriate.

Orgaworld Canada Ltd. (OCL) operates a facility (Facility) at Lot 27, Concession 6, Gloucester in Ottawa, Ontario. The Facility will be located in an area zoned for industrial use. OCL is an aerobic composting operation that will process source separated organics (SSO), such as kitchen waste, and leaf and yard wastes into an unrestricted end product suitable for application on agricultural lands.

The Facility is subject to s.20 of O.Reg. 419/05, therefore the modelled impact of contaminant emissions can be assessed using the AERMOD dispersion model for each contaminant and applicable averaging period.

Odour-based dispersion modelling was performed at each of the sensitive receptors previously identified by the Ontario Ministry of the Environment (MOE), and for the 99.85th percentile as per the MOE proposed position paper "Proposed Approach for the Implementation of Odour-Based Standard and Guidelines" (June 2006).

The Facility is expected to emit Odour, Particulate, Ammonia, and Products of Diesel Combustion. Some of the sources and contaminants were considered negligible in accordance with s.8 of O. Reg. 419/05.

The maximum POI concentrations were calculated based on the operating conditions where all significant sources are operating simultaneously at their individual maximum rates of production. The maximum emission rates for each significant contaminant emitted from the significant sources were calculated in accordance with s.11 of O. Reg. 419/05 and the data quality assessment follows the process outlined in the requirements of the ESDM Procedure Document.

A POI concentration for each significant contaminant emitted from the Facility was calculated based on the calculated emission rates and the output from the approved dispersion model; the results are presented in the Emission Summary Table in accordance with s.26 of O. Reg. 419/05.

The POI concentrations listed in the Emission Summary Tables were compared against criteria listed in the Ministry publication "Summary of Standards and Guidelines to Support Ontario Regulation 419: Air Pollution – Local Air Quality" dated April 2012.

Subject: NASM Sites

Hi Dale – As discussed, I have provided the list of sites in which Orgaworld will be potentially sending processed organic waste not meeting the new Phase II Ontario Compost Quality Standards for moisture. I would like to determine whether these sites already have a NASM Plan in place. Thanks again and if you have any questions please let me know.

Re: Response to MOECC Ottawa District
IMPLEMENTATION OF ONTARIO COMPOST QUALITY STANDARDS – MATURITY AND FOREIGN MATTER

Action plan required for the following:

1. *Process and/or operational changes to the current operations at the Orgaworld Ottawa facility that may be necessary;*
2. *Environmental Compliance Approval amendments required to reflect any required process changes or modifications;*
3. *Options to manage processed organic waste not meeting the Ontario Compost Quality Standards; and*
4. *Timelines associated with the actions necessary for the Orgaworld Ottawa Facility to be compliant with Phase II Ontario Compost Quality Standards.*

Process and/or operational changes to the current operations at the Orgaworld Ottawa facility that may be necessary

1. In order to meet the moisture requirement stated in the new compost regulations, the Ottawa facility will need to look at either installing winterized water tankage, water lines and pumps, or utilizing a water truck to spray the compost. Operational changes will include using this water truck and developing procedures in order to ensure that the spraying of the compost meets the 40% moisture target throughout the entire compost pile.
2. Additional future changes may mean the addition of increased compost storage space, since once the compost piles are sprayed with water, they must be turned, or transferred to an empty storage bunker.
3. Sharps. There has yet to be a definitive definition on what is a sharp or not. The phrase "Shall contain no material of a size or shape that can reasonably cause animal or human injury" is extremely vague. Historical analytical results have demonstrated that with the current incoming wastestream into Ottawa, there should be little difficulty for the Ottawa facility to meet the foreign matter or sharp requirements.

Environmental Compliance Approval amendments required

1) The Ottawa facility will look at utilizing the water taken from the groundwater remediation well and potentially utilize it in order to bring the finished curing compost up to the specified 40% moisture level. Orgaworld has just submitted an amendment request to the MOECC for our Stormwater ECA. It is unclear at this time if we would have to submit another amendment in order to be able to utilize this water from the remediation well.
2) If this water spray equipment was added, it is presumed that this equipment would also require an amendment to the waste ECA since it would be considered a "change or alteration" to the existing facility and the existing process.
3) If deemed that additional compost storage space is required, this will also require an amendment to the existing Waste ECA.

Options to Manage Processed Organic Waste NOT meeting the Ontario Compost Quality Standards

Orgaworld Ottawa will manage the processed organic waste that does not meet the new regulations by utilizing NASM plans which would still allow the compost to go to farmers fields and be utilized in a beneficial manner. Orgaworld has already arranged transport with haulers that are licensed to transport organic waste, and have completed NASM plan agreements with farmers who wish to take our NASM product.

Timelines associated with actions necessary for compliance

It must be noted that for over a year, Orgaworld Canada and the MOECC were in continuous negotiations regarding the new compost regulations. Until recently, Orgaworld and several other compost producers were under the impression that the MOECC was seriously considering other alternatives than the complete adoption of the entire new compost regulation package. This did not occur and the decision to fully adopt the new compost regulations was made, but not communicated to Orgaworld until very recently. With this in mind, Orgaworld Canada would like to request that we would be allowed to honour all of our compost delivery contracts through the end of the 2015 season. This would allow time to discuss with all of our current compost customers:

i) the potential for accepting the NASM product
ii) The restrictions and usage requirements set out in the plan
iii) Take the necessary soil sampling and creation of the plans

If Amendments are required for the water spraying equipment, then the timeframe to submit the application to the MOECC could be at least six months. The MOECC has mentioned that they would be willing to "fast-track" the approvals process, but it is unclear exactly how long that may take. If more compost storage space is required (a multi-million dollar investment), this process, including engineering, financing, MOECC approval and construction could take at least one to two years.

If you have further questions or concerns, please do not hesitate to contact me at your convenience.

Michael Rooke
Compliance Officer

Ontario

Ministry of the Environment and Climate Change

Ministry of the Environment
5/6/2015
10 a.m. to 12 p.m.

Meeting called by: Straberger, Kyle

Attendees:

Kyle Straberger, Senior Environmental Officer, MOECC; Jena Leavoy, District Supervisor, MOECC; Steve Burns, District Manager, MOECC; Michael Rooke, Compliance Officer, Orgaworld; ~~Dale Harley, General Manager, Orgaworld~~

Location: Ottawa District Office, 2430 Don Reid Drive, Ottawa, Ontario, K1H 1E1

Ottawa Boardroom (teleconferencing is available if requested)

Purpose: The purpose of the meeting is to discuss the upcoming implementation of the Phase II Ontario Compost Quality Standards and the impacts the standards will have on the operations at Orgaworld Ottawa Facility located at 5123 Hawthorne Road in Ottawa.

Introduction (Kyle)

1. Round table introductions
2. Review agenda items

Phase II Ontario Compost Quality Standards – MOECC Letter, March 18, 2015 – Request for Action Plan (Kyle)

Maturity & Foreign Matter:

1. Process and/or operational changes
2. Environmental Compliance Approval amendments
3. Options to managed processed organic waste not meeting the Ontario Compost Quality Standards
4. Timelines associated with actions necessary to become compliant with Phase II Ontario Compost Quality Standards

Phase II Ontario Compost Quality Standards – Orgaworld Letter, April 28, 2015 – Response to MOECC Letter (Kyle)

1. Installation of water application equipment, development of procedures and potential increase of capacity. No changes to address 'sharps'
2. Amendments to Industrial Sewage Works and Waste ECAs

3. NASM Plan for non-compliant processed organic waste
4. Request for extension to operate under previous regulatory standards until end of 2015. Environmental Compliance Approvals amendments estimated at 1 to two years

Path forward

1. Revisions to the Action Plan (Kyle)

March 18, 2015

Michael Rooke
Orgaworld Canada Ltd.
5123 Hawthorne Road
Ottawa, ON K1G 3Y3

Dear Sir:

RE: Implementation of Ontario Compost Quality Standards – Maturity & Foreign Matter
Orgaworld Ottawa Facility, 5123 Hawthorne Road, Ottawa
Environmental Compliance Approval No. 2766-7HEPSZ

On July 25, 2012 the Ministry of the Environment and Climate Change (MOECC) released revised standards for aerobic composting of organic waste materials in the province of Ontario entitled *Ontario Compost Quality Standards* ("Standards"). The Standards update and replace the *Interim Guideline for the Production and Use of Aerobic Compost in Ontario*, first released in November 1991, and last updated in 2004.

The Standards outline new categories of compost (AA, A, and B) with specific requirements for metals, quality of feedstock, pathogens, foreign matter and maturity. The MOECC implemented Phase I (metals, quality of feedstock and pathogens) of the Standards on January 1, 2013 with Phase II (maturity and foreign matter) to be implemented on July 1, 2015.

In preparation of the upcoming implementation date, the MOECC would like to engage Orgaworld Canada Ltd. in how the requirements of the Standards will be met.

By **May 1, 2015**, please submit an action plan outlining how the Orgaworld Ottawa Facility will comply with the implementation of Phase II of the Standards on July 1, 2015. The action plan should include, but not necessarily be limited to, the following:

1. Process and/or operational changes to the current operations at the Orgaworld Ottawa Facility that may be necessary;
2. Environmental Compliance Approval amendments required to reflect any required process changes or modifications;
3. Options to manage processed organic waste not meeting the *Ontario Compost Quality Standards*; and
4. Timelines associated with the actions necessary for the Orgaworld Ottawa Facility to be compliant with the Phase II *Ontario Compost Quality Standards*.

Please contact me if you have any questions or concerns with the above request and the implementation of Phase II of the Standards. A meeting can be arranged in the event Orgaworld Canada Ltd. would like to discuss this subject in further detail.

Sincerely,

Kyle Straberger
Environmental Officer

Re: Response to MOECC Ottawa District
IMPLEMENTATION OF ONTARIO COMPOST QUALITY STANDARDS – MATURITY AND FOREIGN MATTER

Action plan required for the following:

1. *Process and/or operational changes to the current operations at the Orgaworld Ottawa facility that may be necessary;*
2. *Environmental Compliance Approval amendments required to reflect any required process changes or modifications;*
3. *Options to manage processed organic waste not meeting the Ontario Compost Quality Standards; and*
4. *Timelines associated with the actions necessary for the Orgaworld Ottawa Facility to be compliant with Phase II Ontario Compost Quality Standards.*

Process and/or operational changes to the current operations at the Orgaworld Ottawa facility that may be necessary

1. In order to meet the moisture requirement stated in the new compost regulations, the Ottawa facility will need to look at either installing winterized water tankage, water lines and pumps, or utilizing a water truck to spray the compost. Operational changes will include using this water truck and developing procedures in order to ensure that the spraying of the compost meets the 40% moisture target throughout the entire compost pile.
2. Additional future changes may mean the addition of increased compost storage space, since once the compost piles are sprayed with water, they must be turned, or transferred to an empty storage bunker.
3. Sharps. There has yet to be a definitive definition on what is a sharp or not. The phrase "Shall contain no material of a size or shape that can reasonably cause animal or human injury" is extremely vague. Historical analytical results have demonstrated that with the current incoming wastestream into Ottawa, there should be little difficulty for the Ottawa facility to meet the foreign matter or sharp requirements.

Environmental Compliance Approval amendments required

1) The Ottawa facility will look at utilizing the water taken from the groundwater remediation well and potentially utilize it in order to bring the finished curing compost up to the specified 40% moisture level. Orgaworld has just submitted an amendment request to the MOECC for our Stormwater ECA. It is unclear at this time if we would have to submit another amendment in order to be able to utilize this water from the remediation well.
2) If this water spray equipment was added, it is presumed that this equipment would also require an amendment to the waste ECA since it would be considered a "change or alteration" to the existing facility and the existing process.
3) If deemed that additional compost storage space is required, this will also require an amendment to the existing Waste ECA.

Options to Manage Processed Organic Waste NOT meeting the Ontario Compost Quality Standards

Orgaworld Ottawa will manage the processed organic waste that does not meet the new regulations by utilizing NASM plans which would still allow the compost to go to farmers fields and be utilized in a beneficial manner. Orgaworld has already arranged transport with haulers that are licensed to transport organic waste, and have completed NASM plan agreements with farmers who wish to take our NASM product.

Timelines associated with actions necessary for compliance

It must be noted that for over a year, Orgaworld Canada and the MOECC were in continuous negotiations regarding the new compost regulations. Until recently, Orgaworld and several other compost producers were under the impression that the MOECC was seriously considering other alternatives than the complete adoption of the entire new compost regulation package. This did not occur and the decision to fully adopt the new compost regulations was made, but not communicated to Orgaworld until very recently. With this in mind, Orgaworld Canada would like to request that we would be allowed to honour all of our compost delivery contracts through the end of the 2015 season. This would allow time to discuss with all of our current compost customers:

i) the potential for accepting the NASM product
ii) The restrictions and usage requirements set out in the plan
iii) Take the necessary soil sampling and creation of the plans

If Amendments are required for the water spraying equipment, then the timeframe to submit the application to the MOECC could be at least six months. The MOECC has mentioned that they would be willing to "fast-track" the approvals process, but it is unclear exactly how long that may take. If more compost storage space is required (a multi-million dollar investment), this process, including engineering, financing, MOECC approval and construction could take at least one to two years.

If you have further questions or concerns, please do not hesitate to contact me at your convenience.

Michael Rooke
Compliance Officer

Process and/or operational
- installing water tanks, new pumps or water treatment
→ what are the processes for testing water (monitoring, testing, mixing, frequency) and records
- additional capacity (hours)
→ will you be able to manage capacity for a period of time after Task 1?

Subject: 2013/2014 Operating Year Inspection - Orgaworld Ottawa - Information Request

Hi Mike,

As stated during the inspection on Thursday January 29, 2015, please find the information I requested for each inspection type completed. If you have any questions please let me know.

Industrial Sewage Works – ECA# 7251-8GKRPD

- Analytical results of the 2014 surface water monitoring program outlined in Condition 5 – Surface Water Monitoring and Recording for the month of February, May, August and November
- Analytical results of the 2014 groundwater monitoring program outlined in Condition 9 – Groundwater Monitoring for the month of February, May, August and November
- **Analytical results of Table 2 Trigger Parameters for discharge events in 2013 as per Condition 6 (5) (check annual report)**
- Copy of the Operation & Maintenance Manual (Part II & Part III)
- Logbook records for routine maintenance activities, inspection findings, and repairs completed in 2014

Air – ECA# 7021-7HQNDE

- Complaints Recording Procedure – Provide copies of the complaint records for the two complaints received in December of 2014. I understand the complaints in the Cornwall area are not related to the Orgaworld site in Ottawa however it will verify compliance that the recording procedure is being complied with.
- The last date of revision of the Emission Summary and Dispersion Modelling Report and Acoustic Assessment Report (last time modifications were made to the facility requiring modelling to ensure compliance with air & noise standards outlined in Ontario Regulation 419/05)
- Records of maintenance completed of the bio filter (media replacement)
- Screen shot of SCADA illustrating the process monitoring of the pollution control equipment

Waste Disposal Site – ECA# 2766-7HEPSZ

- Analytical results of the 2014 incoming and outgoing (including 10-100) as per Condition 7(3), Condition 7(4) and Condition 7(6)
- In 2014 has Orgaworld received results of non-compliance with Quality Compost Standards?
- Screen shot of SCADA illustrating the process monitoring of the composting operations to ensure compliance with Condition 7(8)
- Temperature monitoring records for the curing stockpiles for the following dates: January 15, 2014, February 19, 2014, March 26, 2014, April 30, 2014, May 28, 2014, June 25, 2014, July 30, 2014, August 27, 2014, September 24, 2014, October 29, 2014, November 26, 2014, December 17, 2014

I am currently working on the inspections therefore I may send another email if I require additional information.

Thanks,

Kyle Straberger

Hello David,

Please find attached copies of the inspection reports completed at Orgaworld Ottawa, dated March 15, 2018, located at 5123 Hawthorne Road, Ottawa, On. If you have any questions after the review of the reports please contact me to discuss.

Attachments:

- Air Facility Inspection Report
- Industrial Sewage Works Inspection Report
- Non-Hazardous Waste Transfer Processing Inspection Report
- Subject Waste Generator Inspection Report

The Subject Waste Generator Inspection Report outlines an action item for the confirmation of Copy 6 of Waste Manifest No. RS77263. In your email, dated March 23, 2018, the copy was provided to me therefore the action item has been addressed. The report was already completed and sent for sign-off when you provided the information therefore I couldn't make any changes at that time.

Thank you,

Kyle Straberger

Subject: FW: Negative pressure at SSO composting sites

Good Afternoon, I am writing to you all to follow up on my previous email regarding negative pressure in SSO processing buildings. Do any of you have any monitoring data that would help us at the EAAB defend the negative pressure condition?
Lisa has sent me some information on operations at Universal in Welland and it appears that Universal maintains the negative pressure at all times, even when the doors open to let trucks in and out.
Anybody else?
Thanks, Margaret (and Bijal)

From: Wojcik, Margaret (ENE)
Sent: August 31, 2011 11:52 AM
To: Placko, Joanne (ENE); Mills, Jeff (ENE); Hart, Tracy (ENE); Benvenuti, Lisa (ENE); Armour, Lynnette (ENE)

Subject: Negative pressure at SSO composting sites

Good morning to All,

The issue of negative pressure in the SSO receiving buildings continues to generate challenges for the EAAB reviewers dealing with the SSO composting sites. We are getting contradicting information from proponents with respect to their ability to maintain negative pressure in the SSO containing buildings especially when the doors are open. We acknowledge the fact that some of the negative pressure is lost when the doors are open, but we were under the impression that it is possible to keep the pressure on the negative side, even if it's only slightly negative.

Also, there are discrepancies regarding the maximum level of negative pressure that is physically possible to achieve. In their application, Orgaworld proposed -250 Pa to be maintained in the receiving area and the main hall. The City of Guelph said that it's physically impossible to maintain this level of negative pressure in the building without damage to the building and the doors, and instead proposed -5 to -10 Pa. That is quite a difference.

So to solve this mystery once for all, I would like to ask for the actual negative pressure monitoring data for the composting sites you are looking after. I checked the cofas and hope that the data is available:

City of Hamilton, WDS CofA #A130213, Issue Date: January 28, 2005

68. The Owner and Operator shall maintain a negative air pressure atmosphere in the unloading area at all times. In the event that negative air pressure can not be maintained, the Owner and Operator shall cease accepting additional waste and shall keep the loading bay doors closed until such time as negative pressure is re-established.

But Joanne indicated before that they do measure the magnitude.

Orgaworld Canada Ltd. (London) WDS CofA #5250-6V4HX2, Issue Date: December 20, 2006

46. The Owner shall maintain a negative air pressure atmosphere within the processing building, incompassing the receiving and traffic hall, pump room, and screening area, at all times. In the event that adequate negative air pressure can not be maintained, the Owner shall cease accepting additional waste and shall keep the loading bay doors closed until such

time that negative pressure is re-established.

Jeff, are they measuring the negative pressure?

Orgaworld Canada Ltd. (Ottawa) WDS cofa #2766-7HEPSZ, Issue Date: September 16, 2009

5.(7) Odour Control:

(a) The Owner shall maintain and monitor a negative air pressure atmosphere within the Processing Building at all times in accordance with the documents in Schedule "A". In the event that adequate negative air pressure cannot be maintained within the Processing Building, the Owner shall cease accepting additional Organic Waste and shall keep the loading bay doors and the air intake louvers closed until such time that negative pressure is re-established.

City of Guelph, WDS Cofa #A170128, Notice No. 3, Issue Date: August 11, 2010

36.(6) Odour Control:

(a) The Owner shall maintain a negative air pressure atmosphere within the Processing Building, as compared to the ambient atmospheric pressure, at all times.

Cofa AIR #1721-82YRUS, Issue Date: August 11, 2010

3. The Company shall monitor and record the following physical parameters of the Biofilter and the building, through a combination of sensors, meters and physical probes, at frequencies either as recommended by the Equipment suppliers or as determined by operational needs:

(2) Building:

(a) negative pressure

Universal Resource Recovery Inc., WDS Cofa #9855-73BJGK, Issue Date: December 9, 2010

7.(13) Processing Building Atmosphere:

(a) The Owner shall monitor the following physical parameters of the atmosphere within the Processing Building, through a combination of appropriate sensors, meters and physical probes as follows:

(i) negative pressure within the confines of the Processing Building, continuously; and

---

Thanks a lot everybody. Hope to hear from you soon.

Margaret

Subject: Orgaworld witnessing report
Attachments: 20110718-5070106-Orgaworld_Witnessing_Report.pdf

Tracy,

It was a pleasure meeting you earlier this month. As per usual I am attaching a witnessing report which outlines the portion of the testing that I witnessed. This report also documents the production information recorded during the test period.

As mentioned on-site, if this round of testing once again results in measured TRS concentrations below the method detection limit, it may be reasonable to consider relaxing the sampling requirements for these particular contaminants. Given that these are "Odour based" limits in the Regulation, future odour test results and/or odour complaints may provide an indication as to when TRS testing may be required down the road.

Obviously relaxing any source testing requirements would be to the discretion of the District and dependant on your comfort level. We can always touch base following the report submission.

The Orgaworld Canada Ltd. Ottawa facility (Orgaworld) is located at 5123 Hawthorne Road. The facility currently operates a fully enclosed composting operation which receives compost materials from the City of Ottawa's source separated organics program. The site, pictured below, operates under CofA No. 7021-7HQNDE and is limited to receiving a maximum of 150,000 tonnes per year of organic waste materials.

Currently the facility is operating at a reduced capacity based on the total tonnage of materials permitted. However due to the composition of the materials being received (mostly leaf and yard waste which has a lower density compared to household organics) the facility was near maximum storage capacity during the witnessed test period.

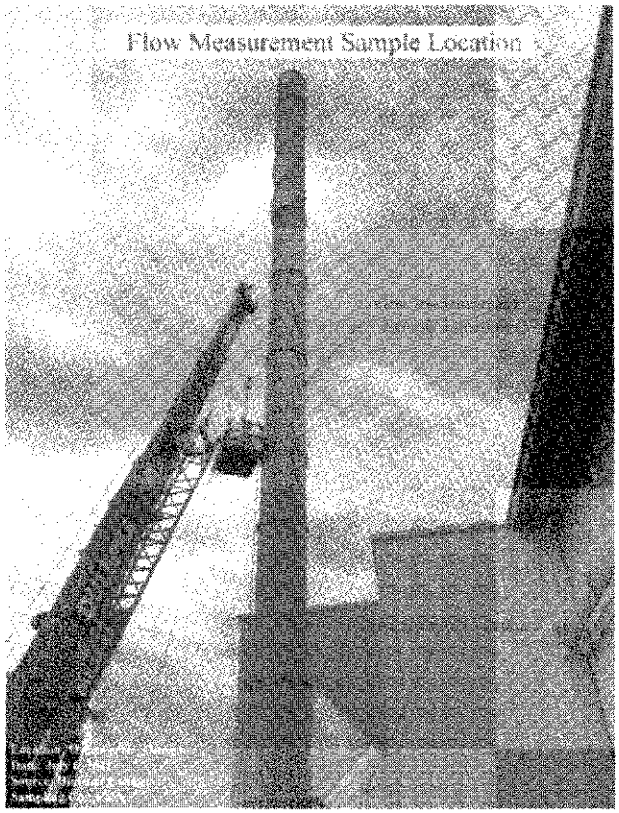
Process Description

Organic waste is transported to the Orgaworld facility via garbage collection trucks. As the trucks fill during their regular collection, they make their way to Orgaworld to unload. Trucks back into the enclosed facility and drop their loads on the tipping floor. Materials are quickly moved to a storage pad which comprises the majority of the buildings footprint. Piled waste sits on the storage / processing pad before being loaded into one of the 6 curing tunnels.

Between 300 and 600 tonnes of materials are loaded into each tunnel for the curing process. There are six (6) curing tunnels currently in operation. During the curing process air is continuously passed through the piled material. With properly maintained parameters (oxygen concentration, temperature, relative humidity and air flow) the organic material is fully composted and ready for market within 6 – 7 days.

Following the curing stage the tunnel is opened and the material is transported to the screening room via front-end loader. The front-end loader dumps the composted material into a screener where the fine and coarse material is separated. The material <10mm diameter is piled and prepared for sale while the 10 – 100 mm diameter material is recycled back through the process. Larger materials >100mm are shredded and pass through the process in the same manner as the 10-100mm material.

The temperature profile for the curing process is cyclical; for roughly the first three days of the curing cycle the tunnel temperature is maintained around 55 – 60 degrees Celsius. The remaining three or four days the tunnel is maintained at a temperature of approximately 40 degrees Celsius. The tunnel is allowed to reach ambient temperature before the tunnel doors are opens and the material is sent to the screening room. It is expected that the highest odour emission potential would be at the beginning of the cycle as the tunnel is being heated and the material is coming up to temperature.



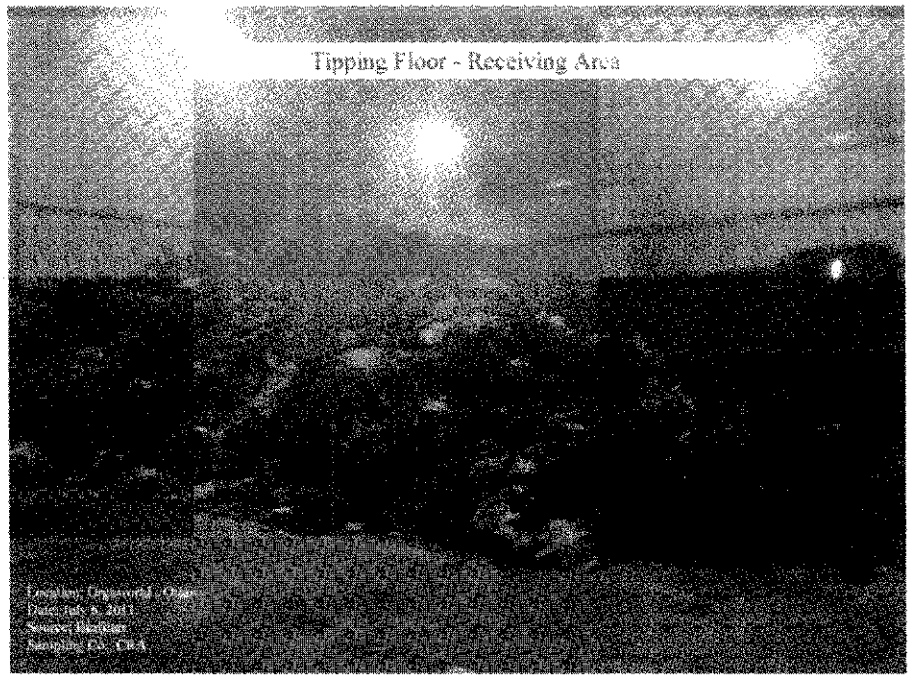
Process air is collected from the receiving area, storage pad and the curing tunnels where it is directed to the pollution control system which consists of an ammonia scrubber, two biofilters

(working in parallel) and a bioscrubber.

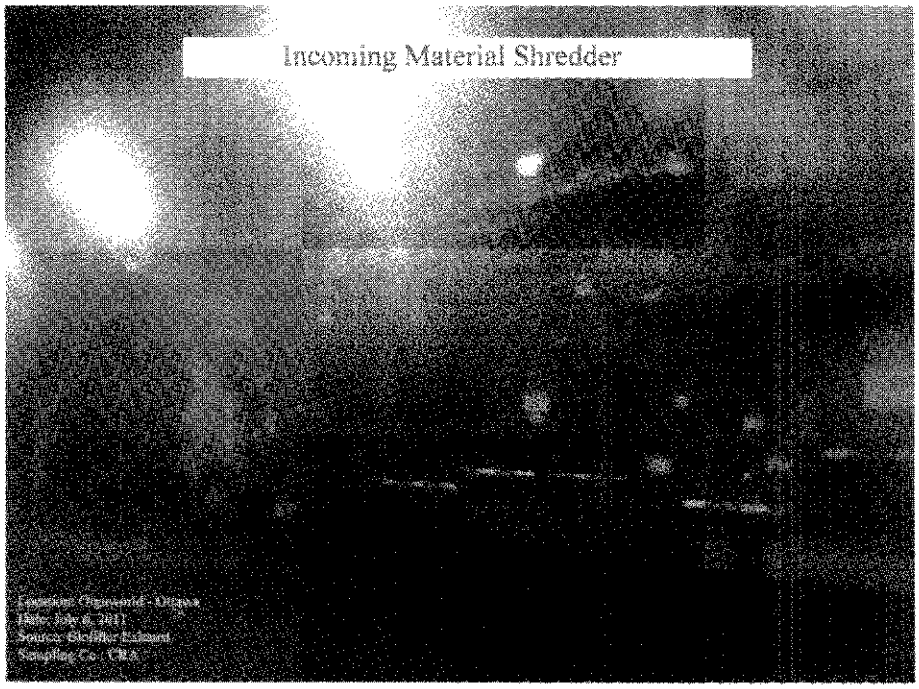
Sampling Locations

Odour sampling was conducted via sampling port installed on the breaching leading to the stack from the bioscrubber. Volumetric flow measurements were completed via two ports situated 90 degrees to one another approximately 4 diameters downstream of the breaching in a straight length of duct. This sample location was non-ideal

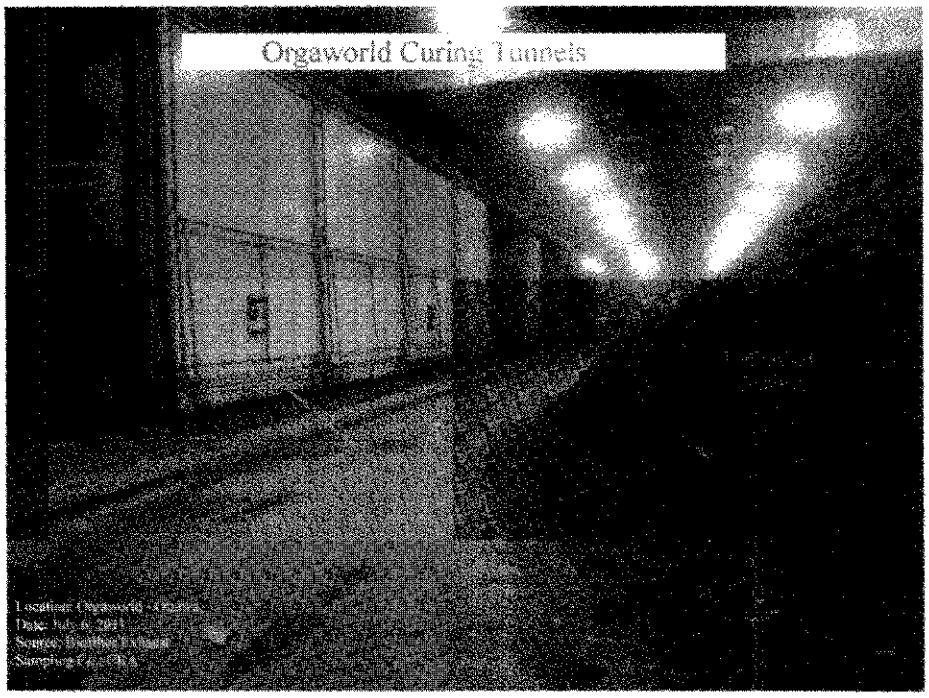
The following photos depict the main stack and the odour sampling location.



Site Observation



On the test date (July 6, 2011) three of the six tunnels were in the heating stage. Two other tunnels



were in transition (either being filled or emptied) and one tunnel was empty. This is consistent with production typically seen at the site. It should be noted however that unlike the previous round of testing there was a significant amount of material in the building, both on the tipping floor and on the storage/processing pad. It appeared that the facility was near its volumetric capacity and process data provided by Orgaworld indicates that a significantly higher amount of materials were being received on a daily basis, for the weeks prior to testing, as compared to previous test programs. All process data, as provided by Orgaworld, has been appended to this report.

Two other notable changes at the facility since the last round of testing include the addition of an on-site shredder which is housed within the building on the processing floor between the tipping floor and the tunnels. This unit is used prior to the curing process. Materials are shredded providing a more consistent feed that can lead to shorter processing times. In addition it was stated that the reject materials which fell in the 10 – 100 mm range are now between the 10 – 20 mm range. Though not confirmed it was assumed that changes have been made in the screening process. Reasons for the changes were not discussed.

A site tour was completed with Michael Rooke (Orgaworld Compliance Officer) and Tracy Hart (MOE Ottawa District Environmental Officer). At the time of the tour (~10:00 a.m.) there was a significant amount of material in the receiving area of the plant and the processing area appeared to be near capacity. The storage pads located across from the curing tunnels (called the mixing/shredding pile by Mr. Rooke) appeared to be completely full. Mr. Rooke estimated the material to consist of approximately 1,200 tonnes. Photos of the facility's processing areas can be seen on the following pages.

Tipping Floor - Receiving Area

Incoming Material Shredder

Both tunnels 7 and 8, which have not been commissioned to-date, were being used to store what appeared to be "10 – 20" material.

A summary of the various stages of each tunnel (as of ~9:00a.m, July 6) can be seen below:

	Mode	Decription
Tunnel #1	Stage II	~80 hrs - estimated 300T material in tunnel
Tunnel #2	---	Being filled with fresh material ~1/2 full
Tunnel #3	Stage IV	~175 hrs - estimated 300T material in tunnel
Tunnel #4	Stage V	~270 hrs - estimated 300T material in tunnel
Tunnel #5	---	Being emptied ~2/3 full or 200T material in tunnel
Tunnel #6	---	Empty

Estimates of materials in tunnels provided by Michael Rooke (Compliance Officer - Orgaworld)

Unlike the previous round of testing there was a significant amount of material in the building, both on the tipping floor and in the processing floor. It appeared that the facility was near its volumetric capacity. Process data, as provided by Orgaworld, has been appended to this report.

Sampling Methodology / Observations

Sampling was completed by John McRae and Chris Adam of CRA. Flow measurements were obtained with the assistance of a crane and a basket, while odour samples were collected from ground level using a port installed on the breaching leading to the main stack.

A moisture test was completed for a period of twenty minutes following the Ontario Source Testing Code Version #2, Nov 1980 – Method 4, to obtain the stack gas moisture content. Odour sampling was completed following procedures outlined in the Draft odour sampling method ON-6 found in the Draft Ontario Source Testing Code, Version #3, July 2009.

TRS sampling was completed following Environment Canada Method EPS 1/RM/6 which utilizes an 85% solution of phosphoric acid contained within a midget impinger for the purpose of removing moisture prior to capturing the stack gas in a Tedlar® sample container. Samples were analyzed on-site using CRA's GC-FPD analyzer.

TRS sampling was completed prior to odour sampling. TRS analysis was completed on-site by CRA using a GC-FPD analyzer. In the previous program personnel from the analytical laboratory (Air Zone) came to the site with the GC analyzer to complete the TRS analysis. For this round of testing CRA had employed their own GC-FPD analyzer. Only portions of the GC-FPD calibration were witnessed prior to departure from site.

Ambient temperature and meteorological data were obtained from Environment Canada. The data originates from a weather station located at the Ottawa International Airport which is located within approximately 15 kilometers of the Orgaworld facility. This data can be seen on the following page:

Latitude: 45°19'21.000" N Longitude: 75°40'09.000 " W Elevation: 114.00 m

limate ID: 6106000 WMO ID: 71628 TC ID: YOW

Final Comments

In general, the portions of the sampling program which were witnessed were completed following the methodology outlined in the approved pre-test plan protocol. As a result of the analysis limitations in the TRS sampling method (Environment Canada EPS Method 1/RM/6) which states

that sample analysis should begin within one (1) hour of sampling, CRA opted to complete on-site analysis. It was clear that CRA was not well versed with the analytical equipment and methodology. Unfortunately as a result of previous commitments, only a portion of the time consuming calibration procedure could be witnessed.

The Orgaworld facility was operating at a much higher production level as compared to previous test programs. Though the facility appeared to be near its volumetric capacity, the low density characteristics of the waste materials (mostly leaf and yard) means they are likely operating below their annual permitted capacity.

MEMORANDUM

TO:	Rick Mosher	REF. NO.:	045804
FROM:	Sarah Tebbutt/Stephen Koo/ca/2	DATE:	March 5, 2009
RE:	**AERMOD Odour Modelling** **Orgaworld Canada Limited, Ottawa, Ontario**		

1.0 INTRODUCTION

This memorandum has been prepared for the Orgaworld Canada Limited facility located in Ottawa, Ontario (Facility). Conestoga-Rovers & Associates (CRA) performed AERMOD dispersion modelling of the Facility to assess future air contaminant compliance against Ontario Regulation 419/05 Schedule 3 standards, and proposed Ontario Ministry of the Environment (MOE) odour guidance.

The dispersion modelling was performed using the United States Environmental Protection Agency (USEPA) multi-source dispersion model, AERMOD, to assess the Facility's ground level concentrations (GLCs). AERMOD is an advanced steady-state plume model that has the ability to incorporate building cavity downwash, actual source parameters, emission rates, terrain, and historical meteorological information to predict ground level concentrations (GLCs) at specified locations.

The AERMOD air dispersion model was used for this assessment as it has been scheduled by the MOE to replace the Regulation 346 model as the new regulatory model in Ontario after a phase in period, as specified by Ontario Regulation 419/05. The Facility's North American Industry Classification System Code is 562210, and the AERMOD model will become the regulatory model for the Facility with Ontario Regulation 419/05 Schedule 3 air quality standards beginning in 2013.

For air contaminants, the MOE air dispersion modelling guidance document "Air Dispersion Modelling Guideline for Ontario" (ADMGO) dated July 2005 was followed. For odour, the MOE position paper "Proposed Approach for the Implementation of Odour-Based Standards and Guidelines" dated June 2006 was followed.

2.0 MODEL DEVELOPMENT

2.1 Computational Models

The following approved dispersion models and pre-processor models were used in the assessment:

- AERMOD dispersion model (v. 07026);
- AERMAP surface pre-processor (v. 06341); and

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

- BPIP building downwash pre-processor (v. 04274).

2.2 Meteorological Data

MOE provides three sets of pre-processed meteorological screening data for use with dispersion modelling. They are: urban, crops and forest. Based on the land-use characteristics around the Facility, the "crops" dataset was used. The surface data is from the Ottawa Airport and Upper Air Data is from Maniwaki, Quebec. The meteorological data covers the dates from January 1, 1996 to December 31, 2000. The hourly data included many factors which affect the dispersion of air contaminants including wind speed, wind direction, temperature, ceiling height, and atmospheric stability.

2.3 Averaging Periods

Averaging periods were selected based on the type of air contaminants modelled. For the unitized emission rate model, the following averaging periods were selected: 1-hour, 24-hour, and 30-day. For the odour model, only the 1-hour averaging period was selected.

2.4 Digital Elevation Model Data

Digital elevation model (DEM) data was obtained from the MOE website and processed using the AERMOD terrain processor AERMAP. AERMAP determines base terrain elevation using the DEM data for all sources, receptors and buildings, and provides the user with a suitable input file for use with AERMOD. The DEM data was provided by the MOE (tile set 135).

2.5 Source Input Parameters

The Facility bio-scrubber was modelled as a point source, with parameters based on the final operational design specifications. The area sources, used in the odour models, are based on predicted operational conditions.

A summary of the AERMOD source input parameters is provided in Table 1.

2.6 Ground Level Concentration Receptor Grid

A tiered receptor grid was defined starting with a rectangular boundary that encloses all the modelled sources (bounding box). A tiered grid was then defined starting from the edge of the bounding box with a fine resolution, to coarser resolutions further away. All tiered distances were defined relative to the bounding box. The receptor grid used is described as follows:

- 20 m spacing within 200 m of the edge of the bounding box;
- 50 m spacing from 200 to 500 m;
- 100 m spacing from 500 to 1,000 m; and
- 200 m spacing from 1,000 to 2,000 m.

A property line ground level receptor grid with 10 m spacing was used to evaluate the maximum property boundary concentration. No receptors were placed inside the Facility's property line.

2.7 Discrete Sensitive Receptors

For the evaluation of odour, discrete sensitive receptors were defined around the Facility based on the locations of nearby homes and communities. MOE defines a sensitive receptor as: residences, camping grounds, schools, community centres, day care centres, recreational centres and outdoor recreational areas; or any other locations as specified by the MOE. A total of 79 sensitive receptors were identified and modelled.

Table 2 provides a list of modelled sensitive receptors.

2.8 On-Site Building Data

The Facility buildings were entered into the model using the USEPA Building Profile Input Program (BPIP), and run to evaluate any building cavity downwashing that may be occurring. Cavity downwash can result in air contaminants being forced to ground level prematurely under certain meteorological conditions.

The single on-site building was modelled with an average roof height of 11 metres.

3.0 DISPERSION MODELLING RESULTS

The AERMOD models were developed and executed following the methodology described above.

The five years of meteorological data included over 43,800 hours of data. For the unitized emission rate AERMOD model, the model was run to calculate the maximum 1-hour and 24-hour unitized GLC dispersion factors, in micrograms per cubic metre per one gram per second ($\mu g/m^3$ per g/s), potentially emitted from the Facility through the bio-scrubber. By multiplying the bio-scrubber contaminant emission rate, in grams per second, by the unitized GLC dispersion factor, a contaminant specific GLC is calculated. For the odour models, the 1-hour 99.85th percentile GLC was calculated for comparison against the odour guideline limit. The MOE proposed guidance specifies the 99.85th percentile modelled maximum concentration to be used for odour assessment. The meteorological conditions, which result in the maximum concentration, are typically stable atmospheric conditions such as an inversion with low wind speed.

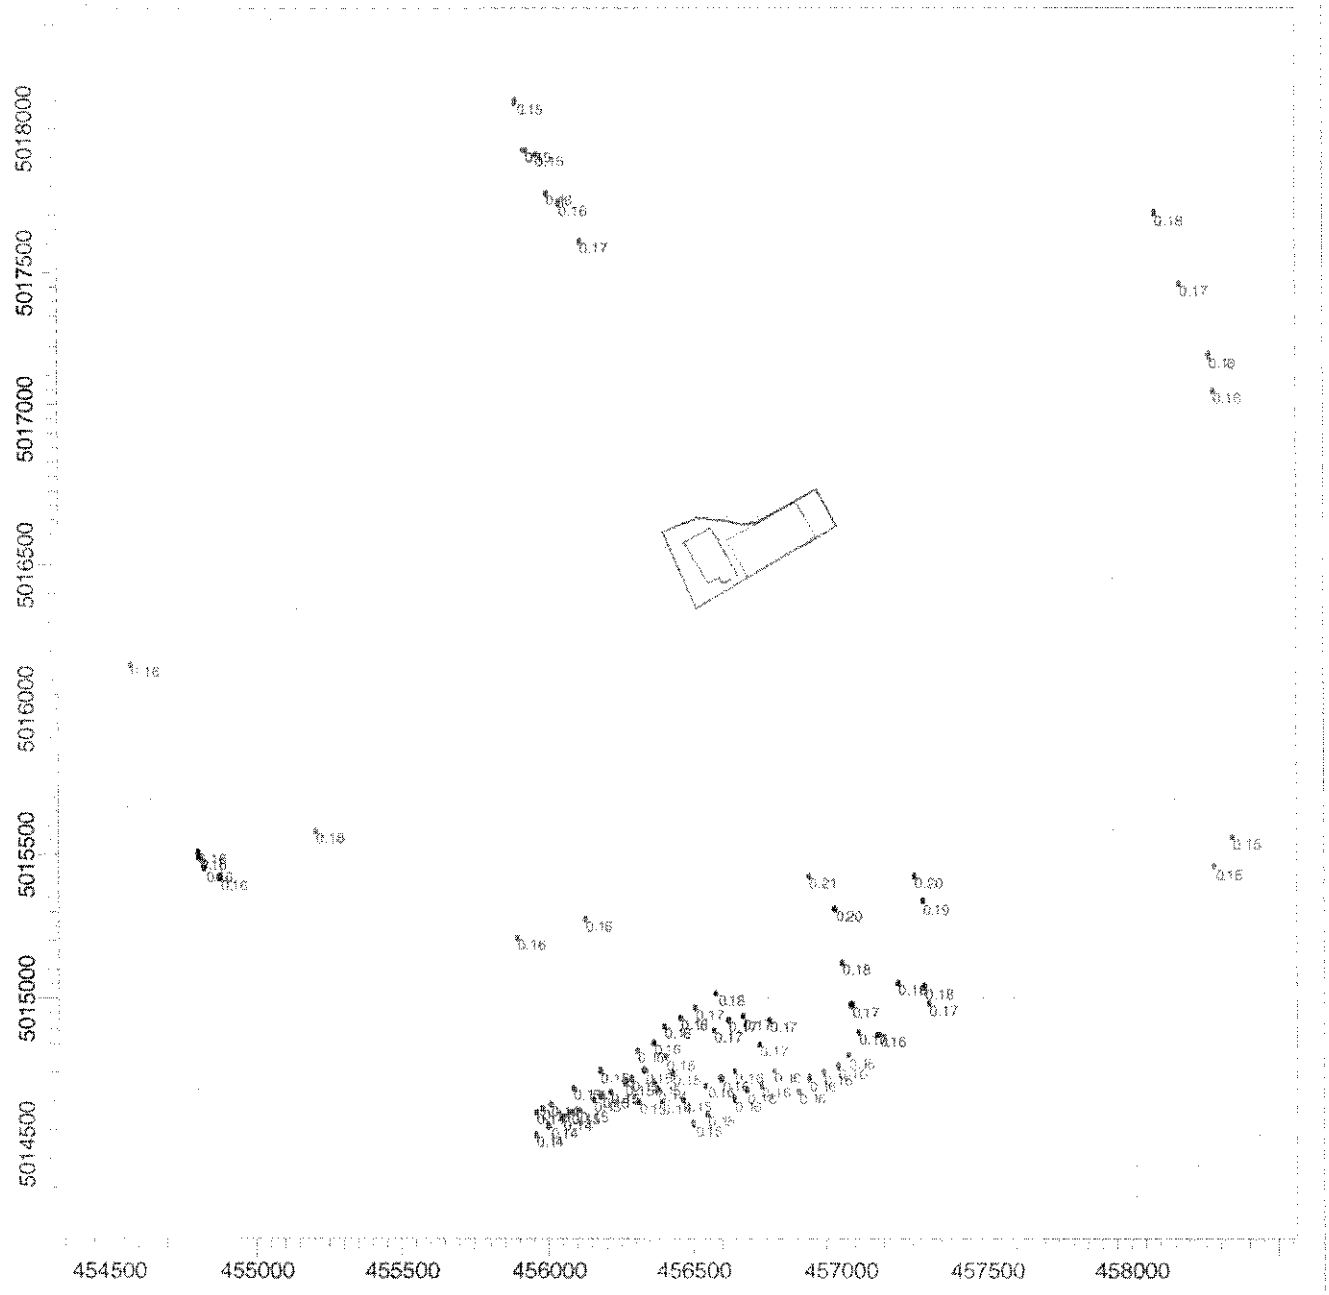
MOE guidance allows for the removal of meteorological outliers for comparison of GLCs against a standard or guideline limit. For the 1-hour averaging period, the eight highest 1-hour averaging periods for each single year was removed for a total of 40 one-hour periods. For the 24-hour averaging period, the single highest 24-hour averaging period for each single year was removed for a total of five 24-hour periods. For each air contaminant, the appropriate unitized averaging period GLC dispersion factor was multiplied by the emission rate of the contaminant to calculate its GLC.

Table 3 summarizes the maximum predicted GLCs for each air contaminant and its percentage of the POI.

For odour, the calculated 1-hour 99.85th percentile odour value was converted to a 10-minute odour value using the MOE time-based conversion factor of 1.65. Figure 1 presents the maximum calculated 10-minute 99.85th percentile odour level at each discrete receptor. Figure 2 presents the maximum calculated 10-minute 99.85th percentile odour isopleths around the Facility.

4.0 CONCLUSIONS

The AERMOD dispersion modelling assessment was completed for odour and each of the contaminants potentially emitted from the Facility.



Based on the modelled GLC results, no air contaminants were identified to exceed any Ontario Regulation 419/05 Schedule 3 standard or MOE guideline.

Based on the modelled odour results, no sensitive receptors were identified that would be impacted with an odour value of greater than the allowable one odour unit.

Should you have any questions on the above, please do not hesitate to contact us.

MEMORANDUM

TO:	Rick Mosher	REF. NO.:	045804
FROM:	Sarah Tebbutt/Stephen Koo/ca/2	DATE:	March 5, 2008
RE:	**AERMOD Odour Modelling** **Orgaworld Canada Limited, Ottawa, Ontario**		

1.0 INTRODUCTION

This memorandum has been prepared for the Orgaworld Canada Limited facility located in Ottawa, Ontario (Facility). Conestoga-Rovers & Associates (CRA) performed AERMOD dispersion modelling of the Facility to assess future air contaminant compliance against Ontario Regulation 419/05 Schedule 3 standards, and proposed Ontario Ministry of the Environment (MOE) odour guidance.

The dispersion modelling was performed using the United States Environmental Protection Agency (USEPA) multi-source dispersion model, AERMOD, to assess the Facility's ground level concentrations (GLCs). AERMOD is an advanced steady-state plume model that has the ability to incorporate building cavity downwash, actual source parameters, emission rates, terrain, and historical meteorological information to predict ground level concentrations (GLCs) at specified locations.

The AERMOD air dispersion model was used for this assessment as it has been scheduled by the MOE to replace the Regulation 346 model as the new regulatory model in Ontario after a phase in period, as specified by Ontario Regulation 419/05. The Facility's North American Industry Classification System Code is 562210, and the AERMOD model will become the regulatory model for the Facility with Ontario Regulation 419/05 Schedule 3 air quality standards beginning in 2013.

For air contaminants, the MOE air dispersion modelling guidance document "Air Dispersion Modelling Guideline for Ontario" (ADMGO) dated July 2005 was followed. For odour, the MOE position paper "Proposed Approach for the Implementation of Odour-Based Standards and Guidelines" dated June 2006 was followed.

2.0 MODEL DEVELOPMENT

2.1 Computational Models

The following approved dispersion models and pre-processor models were used in the assessment:

- AERMOD dispersion model (v. 07026);
- AERMAP surface pre-processor (v. 06341); and

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

- BPIP building downwash pre-processor (v. 04274).

2.2 Meteorological Data

MOE provides three sets of pre-processed meteorological screening data for use with dispersion modelling. They are: urban, crops and forest. Based on the land-use characteristics around the Facility, the "crops" dataset was used. The surface data is from the Ottawa Airport and Upper Air Data is from Maniwaki, Quebec. The meteorological data covers the dates from January 1, 1996 to December 31, 2000. The hourly data included many factors which affect the dispersion of air contaminants including wind speed, wind direction, temperature, ceiling height, and atmospheric stability.

2.3 Averaging Periods

Averaging periods were selected based on the type of air contaminants modelled. For the unitized emission rate model, the following averaging periods were selected: 1-hour, 24-hour, and 30-day. For the odour model, only the 1-hour averaging period was selected.

2.4 Digital Elevation Model Data

Digital elevation model (DEM) data was obtained from the MOE website and processed using the AERMOD terrain processor AERMAP. AERMAP determines base terrain elevation using the DEM data for all sources, receptors and buildings, and provides the user with a suitable input file for use with AERMOD. The DEM data was provided by the MOE (tile set 135).

2.5 Source Input Parameters

The Facility bio-scrubber was modelled as a point source, with parameters based on the final operational design specifications. The area sources, used in the odour models, are based on predicted operational conditions.

A summary of the AERMOD source input parameters is provided in Table 1.

2.6 Ground Level Concentration Receptor Grid

A tiered receptor grid was defined starting with a rectangular boundary that encloses all the modelled sources (bounding box). A tiered grid was then defined starting from the edge of the bounding box with a fine resolution, to coarser resolutions further away. All tiered distances were defined relative to the bounding box. The receptor grid used is described as follows:

- 20 m spacing within 200 m of the edge of the bounding box;
- 50 m spacing from 200 to 500 m;
- 100 m spacing from 500 to 1,000 m; and
- 200 m spacing from 1,000 to 2,000 m.

A property line ground level receptor grid with 10 m spacing was used to evaluate the maximum property boundary concentration. No receptors were placed inside the Facility's property line.

2.7 Discrete Sensitive Receptors

For the evaluation of odour, discrete sensitive receptors were defined around the Facility based on the locations of nearby homes and communities. MOE defines a sensitive receptor as: residences, camping grounds, schools, community centres, day care centres, recreational centres and outdoor recreational areas; or any other locations as specified by the MOE. A total of 79 sensitive receptors were identified and modelled.

Table 2 provides a list of modelled sensitive receptors.

2.8 On-Site Building Data

The Facility buildings were entered into the model using the USEPA Building Profile Input Program (BPIP), and run to evaluate any building cavity downwashing that may be occurring. Cavity downwash can result in air contaminants being forced to ground level prematurely under certain meteorological conditions.

The single on-site building was modelled with an average roof height of 11 metres.

3.0 DISPERSION MODELLING RESULTS

The AERMOD models were developed and executed following the methodology described above.

The five years of meteorological data included over 43,800 hours of data. For the unitized emission rate AERMOD model, the model was run to calculate the maximum 1-hour and 24-hour unitized GLC dispersion factors, in micrograms per cubic metre per one gram per second ($\mu g/m^3$ per g/s), potentially emitted from the Facility through the bio-scrubber. By multiplying the bio-scrubber contaminant emission rate, in grams per second, by the unitized GLC dispersion factor, a contaminant specific GLC is calculated. For the odour models, the 1-hour 99.85th percentile GLC was calculated for comparison against the odour guideline limit. The MOE proposed guidance specifies the 99.85th percentile modelled maximum concentration to be used for odour assessment. The meteorological conditions, which result in the maximum concentration, are typically stable atmospheric conditions such as an inversion with low wind speed.

MOE guidance allows for the removal of meteorological outliers for comparison of GLCs against a standard or guideline limit. For the 1-hour averaging period, the eight highest 1-hour averaging periods for each single year was removed for a total of 40 one-hour periods. For the 24-hour averaging period, the single highest 24-hour averaging period for each single year was removed for a total of five 24-hour periods. For each air contaminant, the appropriate unitized averaging period GLC dispersion factor was multiplied by the emission rate of the contaminant to calculate its GLC.

Table 3 summarizes the maximum predicted GLCs for each air contaminant and its percentage of the POI.

For odour, the calculated 1-hour 99.85th percentile odour value was converted to a 10-minute odour value using the MOE time-based conversion factor of 1.65. Figure 1 presents the maximum calculated 10-minute 99.85th percentile odour level at each discrete receptor. Figure 2 presents the maximum calculated 10-minute 99.85th percentile odour isopleths around the Facility.

4.0 CONCLUSIONS

The AERMOD dispersion modelling assessment was completed for odour and each of the contaminants potentially emitted from the Facility.

Based on the modelled GLC results, no air contaminants were identified to exceed any Ontario Regulation 419/05 Schedule 3 standard or MOE guideline.

Based on the modelled odour results, no sensitive receptors were identified that would be impacted with an odour value of greater than the allowable one odour unit.

Should you have any questions on the above, please do not hesitate to contact us.

S - Ontario Regulation 419/05 published standard
(1) Units are in ug/m^3 unless otherwise noted.
(2) The odour value represents the maximum predicted 10-minute 99.85th percentile value at any sensitive receptor identified in Table 2.
(3) Based on a 1-hour unitized dispersion factor, after removal of meteorological outliers, of 6.24 ug/m^3 per g/s.
(4) Based on a 24-hour unitized dispersion factor, after removal of meteorological outliers, of 1.88 ug/m^3 per g/s.
(5) Based on the 1-hour unitized dispersion factor as described in note (3) and applying the MOE 1-hour to 30-minute time-based conversion factor of 1.2.

Hello David,

Please find attached copies of the inspection reports completed at Orgaworld Ottawa, dated March 15, 2018, located at 5123 Hawthorne Road, Ottawa, On. If you have any questions after the review of the reports please contact me to discuss.

Attachments:

- Air Facility Inspection Report
- Industrial Sewage Works Inspection Report
- Non-Hazardous Waste Transfer Processing Inspection Report
- Subject Waste Generator Inspection Report

The Subject Waste Generator Inspection Report outlines an action item for the confirmation of Copy 6 of Waste Manifest No. RS77263. In your email, dated March 23, 2018, the copy was provided to me therefore the action item has been addressed. The report was already completed and sent for sign-off when you provided the information therefore I couldn't make any changes at that time.

Thank you,

Kyle Straberger

1. Introduction

GHD (formerly Conestoga-Rovers & Associates [CRA]) was retained by Orgaworld Canada Ltd. (Orgaworld) to conduct a Groundwater and Surface Water Monitoring Program (Monitoring Program) at the Orgaworld Source Separated Organics (SSO) Processing Facility (Facility) located at 5123 Hawthorne Road in Ottawa, Ontario (Site).

A Site location map is provided on Figure 1.1.

The 2017 Monitoring Program was completed in general accordance with the requirements of the Facility's Industrial Sewage Works Environmental Compliance Approval (No. 2844-9YNGZC) as amended on February 1, 2017 (herein referred to as the ECA). A copy of the Facility's ECA is provided as Appendix A which is included on the CD at the end of this report. Please note that all Appendices are included on the CD.

The purpose of the Monitoring Program is to assess the potential for activities conducted at the Site to adversely affect the surrounding surface water and groundwater quality, in accordance with the ECA.

1.1 Site Background

The Site consists of an area of approximately 10-hectares that is located within an industrial development area. The area, known as the Hawthorne Industrial Park, occupies a surface area of approximately 80-hectares (referred to herein as the HIP subdivision) and has been developed by R.W. Tomlinson (Tomlinson) as an industrial business area. Orgaworld is a tenant of Tomlinson.

Between June and August 2008, GHD conducted Phase I and II Environmental Site Assessment (ESA) investigations for Tomlinson to determine the general suitability of the HIP subdivision lands for development as an industrial park. More specifically, the ESAs were completed to support a Site Plan Control Application for the lease and subsequent development and operation of the SSO facility in the southwest portion of the HIP (CRA, 2008a). GHD submitted the ESAs to the City of Ottawa on behalf of Orgaworld.

The 2008 groundwater monitoring/sampling activities included sampling of ten shallow aquifer wells (MW1-08 to MW10-08) and three surface water locations (SW1 to SW3). In addition, Golder Associates Ltd. (Golder) conducted a pumping test and sampling of the deep groundwater wells in August 2008 (TW-2 and TW-3) and October 2008 (TW-4 to TW-6) (Golder, 2008).

In 2009, GHD was tasked by Orgaworld to generate the Monitoring Program, based on a request from the MOECC through the process of reviewing the ECA application. In March 2010, the Monitoring Program was modified through an ECA amendment to reflect current Site conditions and monitoring well availability. Further modifications to the monitoring program were required in 2013, to reflect additional changes in the monitoring well network (replacement and addition of new monitoring wells).

Condition 9(8) of the former ECA (Industrial Sewage Works No. 7251-8GKRPD) states that:

> *"the Owner shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this Certificate to the Director and the District Manager."*

In order to satisfy this condition, GHD prepared a Compliance and Trigger Level Monitoring Program (TLP) in 2014/2015. The TLP was submitted to the MOECC along with an application to amend the ECA in March 2015. The updated TLP uses a focused set of parameters and statistically based upper tolerance limits (UTLs) developed from historical data for the purpose of setting Site-specific trigger levels for the selected parameters. A complete discussion and assessment consistent with the TLP is included in Section 5.0. For reference, a copy of the memorandum sent to the MOECC that outlines the updated TLP is included in Appendix B1.

GHD prepared a Monitoring Program Rationalization (MPR) for the Site during 2015. The purpose of the MPR was to ensure that groundwater and surface water was being adequately monitored. This was accomplished through a review of the monitoring program and removal of any redundant or unnecessary monitoring. The principal recommendations of the MPR are as follows:

- Incorporate the proposed monitoring and extraction wells into the monitoring program upon installation
- Reduce monitoring from quarterly to three times per year
- Remove polycyclic aromatic hydrocarbon and petroleum hydrocarbon monitoring from the program

A copy of GHD's memorandum outlining the MPR is included in Appendix B2.

On February 1, 2017, the MOECC issued a revised ECA (No. 2844-9YNGZC) for the facility. The revised ECA incorporates the updated TLP submitted to the MOECC in March 2015. The 2017 monitoring program was completed in accordance to the schedules in the revised ECA. A copy of the revised ECA is included in Appendix A.

This report presents an assessment of the groundwater and surface water quality at the Site and covers the period between January and December 2017.

1.2 Site Setting

The Site is located at the southwest corner of the HIP subdivision lands, located within the former Township of Gloucester (community of South Gloucester), which was amalgamated in January 2001 as part of the City of Ottawa. The HIP subdivision was developed by Tomlinson, and is located southeast of the Hawthorne Road and Rideau Road intersection, in the southeast area of the City of Ottawa.

The layout of the Site, commencing at the western portion of the Site off the Hawthorne Road entrance, consists of a large processing plant with a delivery/receiving area, administrative office, septic bed area, and emission stack. An asphalt skirt extends around three sides of the building, which slopes north, east, and south towards an on-Site perimeter ditch system. The on-Site perimeter ditch system drains to the storm water management (SWM) pond located at the east side

of the Site (see Figure 1.2) Surface run-off from the Site generally drains to the on-Site perimeter ditch system to the on-site SWM pond where it is impounded for re-use in the Facility process or until manual release off-Site through local roadside ditches within the HIP subdivision, which discharge to a central stormwater dry pond for the HIP subdivision, and then to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River. The central and southwestern portions of the Site are unfinished and consist of exposed bedrock, gravelly sands, levelled fill material, and a few shrubs and grass scrub.

Historically, since the early 1990's, the HIP Subdivision lands have been used for the placement of inert fill from construction and demolition projects as backfill, and as a temporary storage area for precast concrete pipe and chambers. The fill placement on the HIP lands represented materials that were being progressively used for backfill/leveling operations throughout the Industrial Park. A ditch used to convey groundwater pumped from the Rideau Road Quarries (Quarry #1 and Quarry #2) and the Dibblee Quarry (all located west/southwest of the Site) has been observed along the western and northern boundaries of the HIP subdivision. This ditch eventually flows into the Findlay Creek Municipal Drain at the northeast corner of the HIP subdivision. Findlay Creek Municipal Drain is situated along the northeastern boundary of the HIP subdivision.

1.3 Site Processes

The Facility is an aerobic composting operation that is approved to receive and process organics including source separated organics (SSO), brush material, food wastes (solid or sludge), commercial waste (restaurant wastes, etc.) and other sludges. Organics are processed into a Non-Agricultural Source Material (NASM) and into animal bedding, or for other similar applications. The Facility is designed to receive and process organics, to manage the resulting products and emissions, and to manage environmental impacts that are a result of the processing operations.

Storm water run-off from the Site drains to the on-Site SWM pond and is retained for use in Orgaworld's process, in accordance with the Site's ECA. If excess water is available in the SWM pond, then Orgaworld undertakes analysis and testing of the pond water. If analysis and testing show acceptable water quality, the excess stormwater is discharged into the HIP roadside ditch network.

1.4 MOECC Correspondence to Date

The correspondence below documents the communications between Orgaworld and the MOECC with regards to the application, requested amendments, and subsequent issuance of the Site's current ECA (Industrial Sewage Works) No. 2844-9YNGZC (formerly covered under ECA No. 7251-8GKRPD):

- Application for Approval of Industrial Sewage Works, Storm Water Management Facility, Ottawa City, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; September 19, 2008) (CRA, 2008b).
- Proposed Groundwater/Surface Water Monitoring Program, Application for Approval of Industrial Sewage Works, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, City of Ottawa, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; June 25, 2009).

- Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MOE; September 16, 2009).
- Summary of Pre-Start-up Groundwater/Surface Water Monitoring Program, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, Ottawa, Ontario (CRA; February 5, 2010a).
- Amendment Application, Deep Groundwater Monitoring Well Relocations, Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2010b).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; September 7, 2010).
- Amendment Application, New Equipment Installation, Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (CRA; March 18, 2010c).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7251-8GKRPD, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; May 30, 2011).
- Letter RE: 2012 Groundwater/Surface Water Monitoring and Compliance Report, Orgaworld Organics Facility — SWM Pond, from Ministry of the Environment Ottawa District Office (MOE, September 13, 2013).
- Memorandum RE: Groundwater Assessment and Work Plan – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; July 16, 2014).
- Memorandum RE: Recommended Compliance and Trigger Level Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 3, 2015a).
- Memorandum RE: Proposed Monitoring Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 27, 2015b).
- Environmental Compliance Approval – Application for Amendment (ECA No. 7251-8GKRPO), Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2015d).
- Memorandum RE: Orgaworld Organics Facility 2015 Groundwater and Surface Water Monitoring Report, Trigger Level Program, 5123 Hawthorne Road, City of Ottawa- Hydrogeologic Assessment from Ministry of the Environment and Climate Change Water Resources Unit, Eastern Region (MOECC, January 3, 2017a).
- Environmental Compliance Approval (Industrial Sewage Works) No. 2844-9YNGZC Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MOECC, February 1 ,2017b).

1.5 Groundwater/Surface Water Monitoring Activities

In accordance with recommendations of the Groundwater/Surface Water Monitoring Program (CRA, 2009) and Amendment Application (CRA, 2010b), GHD has completed ongoing monitoring from 2009 to present.

The following monitoring activities were completed at the Site during the current monitoring period:

- June 2017 - Semi-annual sampling:
  - Sampling at four surface water locations (SW-1 to SW-4)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
- August 2017 - Tri-annual sampling:
  - Hydraulic monitoring and sampling at six shallow unconfined aquifer wells (MW5-09, MW101-13, MW102-09, MW104-13, MW105-13, and MW106-15)
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
- November 2017 - Semi-annual sampling::
  - Sampling at four surface water locations (SW-1 to SW-4)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch

2. Physical Setting

2.1 Site Geology

The Site-specific geology was determined through visual examination of the soil samples collected across the HIP subdivision lands during previous investigations and through examination of the stratigraphic logs.

A total of 19 monitoring wells and one extraction well have been completed in the shallow unconfined aquifer unit throughout the HIP subdivision, 16 of which have been completed within the limits of the Orgaworld Site.

Test wells (TW-1 to TW-6) were completed by Golder in 1993 and 2008. TW-1 through TW-6 extend into the deep bedrock aquifer unit which was identified as the Nepean bedrock formation (Golder Associates, 2008).

In May 2010, GHD oversaw the installation of two on-Site deep bedrock test wells (TW-7 and TW-8). The stratigraphic logs from GHD's monitoring wells confirmed the presence of limestone.

Ontario Geologic Survey (OGS) mapping shows the Oxford Formation (Dolostone) covers much of the Site with the March and Nepean Formations (Dolostone/Sandstone formations) exist in the Northern portions of the HIP (OGS, Map 1508A).

The geological unit intercepted at each well is summarized in the monitoring well construction details provided in Appendix C for the overburden and deep bedrock wells. Monitoring location details are provided in Table 2.1.

Examination of the stratigraphic logs prepared by GHD indicates that the geology is generally consistent across the HIP subdivision. Five main geologic units were identified across the area investigated; these units are:

- Heterogeneous fill
- Topsoil layer
- Alluvial sand and silts
- Glacial till
- Bedrock

The topography and geology observed throughout the region are remnants of glacial scour, and more recently, marine deposits with some removal by fluvial erosion. The Site is located on a former quarry and thus filling activities have been carried out since the early 1990's which have significantly altered the local topography.

For 15 years or so prior to Facility construction, portions of the HIP subdivision have reportedly received inert fill from construction and demolition projects throughout the Ottawa area. The fill material received at the HIP subdivision was historically used to level some of the ground surface; however the southern and eastern areas have historically received very little amounts of fill.

The HIP subdivision is generally flat with the exception of the southwest corner, where there formerly existed a rock knoll, now a rock outcrop. The top of this rock outcrop is approximately 10 m higher than the surrounding grades of the HIP subdivision.

The geology and hydrogeology of the geological units identified are discussed below.

Fill

Results of borehole drilling and soil sampling investigations by GHD indicate that most of the HIP subdivision is overlain by fill material. The fill was found to be heterogeneous and generally consisted of a granular matrix (sand, silts, and gravel) with traces of construction waste (concrete, asphalt, wood, and brick), occasionally some clay, boulders, and dredged sediment. The fill material was generally observed to be in a compact and moist state.

Topsoil

The topsoil found was generally fine silty sand with organic material. It was dark brown to black in colour, and was generally loose and moist. Topsoil was found in most locations that were not used as roads. In several locations, the topsoil contained roots and wood debris.

Alluvial Sands and Silts

Underlying the fill and/or topsoil, alluvial sand and silt deposits were observed. Where encountered, these deposits were found to vary in density from loose to dense, and generally described as very moist to wet.

Glacial Till

A glacial till was encountered below the fill and/or alluvial sands and silts in the western half of the HIP subdivision. The glacial till encountered was predominately a silty sand matrix with some gravel, cobbles, and trace clay and boulders. The material was brown to grey in colour, was generally very moist to wet, and was in a compact to dense state. The glacial till was observed to be directly overlying the bedrock.

Bedrock

On a regional basis, the bedrock underlying the HIP subdivision consists predominantly of limestone, sandstone, and dolostone of the Nepean, March and Oxford Formations. Top of bedrock was observed at depths varying from surface outcrops to a depth of approximately 7.6 metres below ground surface (m bgs) at the location of MW6-08. Bedrock core extending from 1.1 to 2.6 m into the bedrock was collected from MW2-08 and MW4-08 to identify and characterize the bedrock. The bedrock at MW2-08 and MW4-08 was described as fractured grey limestone. The bedrock was generally found to be fractured in the upper meter, where core recovery ranged from 93 to 94 percent and Rock Quality Designation (RQD) ranged from 63 to 75 percent. At depths in excess of 1 m into the bedrock, at MW2-08, the bedrock was found to be more competent with a recovery of 100 percent and a RQD of 93 percent.

2.2 Site Hydrogeology

Based on the review of information, the geological sequence observed at the HIP subdivision can be grouped into the two main hydrogeological units:

- A shallow unconfined groundwater unit (referred to as shallow unconfined aquifer) within the permeable fill, alluvial sands and silts and shallow fractured bedrock.
- A deep confined bedrock unit (referred to as the deep bedrock aquifer).

The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA, 2008a). Additional groundwater information regarding groundwater flow direction and velocity within the unconfined shallow aquifer unit is discussed in Section 4.1.

As part of GHD's Phase II ESA in 2008 (CRA, 2008a), an assessment of the connectivity between the shallow unconfined aquifer unit and the underlying deep bedrock aquifer unit was conducted by

performing pumping tests at TW-1 through TW-3 in the deep bedrock aquifer unit. During the pumping test, water levels gathered from the shallow unconfined aquifer unit indicated no corresponding drawdown between the shallow and deep wells. Water levels in the deep bedrock aquifer unit lowered from 1.2 to 3.7 m during the 6-hour period. Based on the data, it was concluded that the shallow unconfined aquifer unit and the deep bedrock aquifer units are not hydraulically connected.

2.3 Surface Water and Drainage Features

Surface water run-off from the HIP subdivision generally drains through local ditches to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River.

A series of ditches within the Site drains to the on-Site SWM pond. The flow of the water from the SWM pond is controlled by a valve that outlets to a ditch which runs along the HIP subdivision internal roadway (Somme Street), towards the east through a central SWM pond, eventually out letting to Findlay Creek.

Another ditch runs along Hawthorne Road, flowing towards and eventually along Rideau Road, connecting to Findlay Creek; this ditch does not connect to the Orgaworld Site at Hawthorne Road or to Somme Street.

2.4 Groundwater Use

Water well data reviewed by GHD shows that the shallow unconfined water table unit is not locally used as a potable water source (Golder, 2008) (deemed unsuitable due to proximity to ground surface, limited saturated thickness, and low yield). The water well records indicate that the deep bedrock aquifer test wells located in proximity of the HIP subdivision are all installed within the deep bedrock aquifer formation at depths generally at or in excess of 30 m bgs (Appendix C2). Bottled water is brought in for consumption at the Site, while water from TW-4 supplies sinks, showers, toilets, and the dishwashing machine for the Facility. As necessary, TW-4 is also used as an alternative refilling source for replenishing the fire suppression water holding tank.

3. Monitoring Program

The Site's Monitoring Program consists of the following:

- Hydraulic (water level) monitoring (in the monitoring wells, extraction well, and surface water staff gauges)
- Groundwater and surface water sample collection and analysis
- Quality Assurance/Quality Control (QA/QC) sample collection and analysis

3.1 Monitoring Network

Currently the groundwater monitoring network consists of the following monitoring wells:

- Shallow unconfined aquifer unit: twelve groundwater monitoring wells and one extraction well: MW01-08, MW2-08, MW3-08, MW4-08, MW4-09, MW5-09, MW101-13, MW102-09, MW103-09, MW104-13, MW105-13, MW106-15, and EW107-15.
- Deep bedrock aquifer unit: three monitoring wells: TW-4, TW-7, and TW-8.

Surface water quality is monitored through four surface water monitoring locations (SW-1 to SW-4). Surface water level monitoring in the northern ditch is monitored by the four staff gauges (SG-1 through SG-4).

Table 3.1 provides a summary of the 2017 monitoring program.

The groundwater and surface water monitoring locations within the HIP subdivision are provided on Figure 3.1. Figure 3.1 also shows the Site limits included in the Orgaworld lease and the boundary of the HIP subdivision.

Figure 3.2 shows the groundwater and surface water locations on the Orgaworld Property.

3.2 Monitoring Protocol

3.2.1 Groundwater Monitoring

The depth to groundwater was measured using an electronic water level meter with the top of the monitoring well riser pipe as the reference point, or to the top of the steel casing for all deep bedrock aquifer monitoring wells. Groundwater elevations were subsequently calculated for each monitoring well by subtracting the depth to water measurement from the reference point elevation.

Groundwater samples were collected by following GHD's field method guideline protocols, which are consistent with MOECC requirements. All shallow aquifer monitoring wells and deep aquifer monitoring wells, except TW-8, were purged and sampled using low-flow sampling techniques with dedicated polyethylene tubing and a peristaltic pump. Wells were sampled following stabilized field readings.

During mid-2016, a dedicated sampling port was installed in the Facility to facilitate sampling from EW107-15. The sample is collected after the extraction well and sample port are purged for several minutes to ensure the sample port and associated lines are clear of stagnant water.

Due to the greater depth to groundwater, deep bedrock aquifer unit monitoring well TW-8 was sampled using low-flow methods with dedicated polyethylene tubing and a bladder pump system.

The samples collected for metals analysis were field filtered using disposable 0.45 µm in-line filters. All groundwater samples collected were submitted to ALS Environmental (ALS) of Waterloo, Ontario for analysis under standard chain-of-custody protocol. Analytical results are discussed in Section 4.

The analytical parameter list for groundwater is summarized in Table 3.1.

The original laboratory analytical reports are provided in Appendix D.

3.2.2 Surface Water Monitoring

Surface water samples were collected at four locations (SW-1 to SW-4) following GHD's field method guidelines. Surface water samples were collected by gently immersing the sample bottles in the ditch, creek or pond water, taking care not to disturb the underlying sediments. Readings for pH, conductivity, dissolved oxygen, oxidation reduction potential (ORP), turbidity, and temperature were recorded at the time of sample collection. All surface water samples were collected without field filtering and as such, represent total parameter concentrations. Potential dissolution of particulates by the acid preservative in the metals sample bottles may affect parameter results for the surface water samples. All surface water samples collected were submitted to the laboratory for analysis under standard chain-of-custody protocol. The sample parameter list for surface water sampling is the same as the parameter list for groundwater (refer to Table 3.1).

Hydraulic level monitoring is completed at four staff gauges located throughout the northern Site ditch. The depth to standing-surface water was visually observed to be nil/dry during the staff gauge monitoring events in 2017.

3.3 Quality Assurance/Quality Control Program

A QA/QC program was undertaken as part of the Monitoring Program. This program involved the collection and analysis of field duplicate samples and the evaluation of standard laboratory quality control samples and procedures. The potential for contamination of samples through field and laboratory procedures is monitored through the analysis of field and laboratory blanks and duplicates samples.

The quality control parameters were found to be within acceptable ranges of standard laboratory practice. Several qualifications of the 2017 analytical data were made through the QA/QC assessment.

Details of the QA/QC Assessment for the current monitoring period are provided in Appendix D. The qualifications indicated in Appendix D do not significantly alter the interpretation of the data or affect the conclusions provided in this report.

4. Monitoring Results

The results of the Monitoring Program for the current monitoring period are presented in the following sections as follows:

- Section 4.1 - Groundwater Hydraulic Monitoring
- Section 4.2 - Water Quality Monitoring

To better facilitate discussion of the water quality, the sampling points for the Monitoring Program have been divided into the following areas: shallow unconfined aquifer unit, deep bedrock aquifer unit, and surface water. Each is discussed in an upgradient to downgradient or upstream to downstream fashion.

4.1 Groundwater Hydraulic Monitoring

Groundwater elevation data collected during the current monitoring period is presented in Table 4.1. Groundwater elevations measured during the June and November 2017 monitoring events are consistent with those observed historically at the Site, and were used to develop groundwater contour figures, as presented on Figures 4.1 to 4.4. Shallow unconfined aquifer and deep bedrock aquifer groundwater elevations and contours for the June 2017 monitoring event are presented on Figures 4.1 and 4.3, respectively, and shallow unconfined aquifer and deep bedrock aquifer groundwater levels and contours for the November 2017 monitoring event are presented on Figures 4.2 and 4.4, respectively.

The shallow aquifer water table was encountered at elevations varying from 90.51 to 98.36 metres above mean sea level (m AMSL) at MW103-09 and MW3-08 during the June monitoring event and 90.50 to 98.43 m AMSL at MW103-09 and MW3-08 during the November event. Based on the groundwater elevations gathered in June and November 2017, flow occurs in an east-northeast direction in the shallow unconfined aquifer. This is consistent with previous monitoring years.

The horizontal hydraulic gradients for the shallow unconfined aquifer unit for the June and November 2017 monitoring events were estimated from groundwater contours presented on Figures 4.1 and 4.2 to be approximately 0.02 m/m across the Site. The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA 2008b). Assuming an effective porosity of 40 percent for the shallow unconfined aquifer unit, an estimate of the groundwater flow velocity can be determined from the following equation:

$$v = \frac{Ki}{n}$$

Where:

v = groundwater flow velocity (L/T)

K = hydraulic conductivity (L/T)

i = horizontal hydraulic gradient (unitless)

n = effective porosity

Based on this equation, the local groundwater velocity in 2017 is estimated to range from a few millimeters per year to a high of approximately 6.2 m per year in the fill deposits and shallow fractured bedrock. Note that the hydraulic conductivity was estimated prior to development of the Site and may not be reflective of the current conditions at the Site.

During the 2017 monitoring period, the deep bedrock aquifer unit groundwater levels ranged from a low of 83.41 m AMSL (TW-8) to high of 89.56 m AMSL (TW-7). The seasonal water level fluctuation ranged from 0.05 m (TW-4) to 0.07 m (TW-8). The seasonal water level fluctuation ranges were much smaller than past years due to the elimination of the winter sampling event which historically exhibited the highest water elevations. Based on the 2017 groundwater elevations, groundwater in the deep bedrock aquifer unit flows in a west-southwest direction, which is opposite to the flow direction of the shallow unconfined aquifer unit. It is likely that the presence of a quarry to the west

and southwest of the Site has influenced the groundwater flow direction within the deep bedrock aquifer unit. This is consistent with previous interpretations of groundwater flow across the Site.

Based on groundwater contours generated for the Site, hydraulic gradients for the deep aquifer unit were calculated at 0.015 m/m for both the June and November 2017 events.

4.2 Water Quality Monitoring

The following Sections provide a discussion regarding the spatial and temporal trends of selected indicator parameters at the Site.

4.2.1 Shallow Unconfined Aquifer Unit Groundwater Quality

Groundwater flow in the shallow unconfined aquifer occurs in an east-northeast direction, as illustrated on Figures 4.1 and 4.2. According to the position relative to the Facility, the groundwater monitoring wells can be grouped as:

- Upgradient wells: MW3-08 and MW4-09
- Upgradient/cross gradient wells: MW2-08
- Facility Area: EW107-15, MW101-13, and MW105-13
- Downgradient: MW1-08, MW5-09, MW102-09, MW103-09, MW104-13, and MW106-15

Tabulated analytical results for the shallow unconfined aquifer from the 2017 sampling program are provided in Table 4.2.

On behalf of Orgaworld, GHD completed a Groundwater Assessment and Work Plan in July 2014 (Groundwater Assessment, Appendix B3). The Groundwater Assessment evaluated the 2013 and historical groundwater quality in order to determine appropriate parameters of concern for the Site. Previous evaluations of groundwater quality at the Site identified ammonia as the primary indicator parameter for facility-related groundwater quality impacts at the Site. The Groundwater Assessment confirmed the presence of an ammonia plume within the shallow unconfined aquifer unit, originating from the Facility.

The Groundwater Assessment also identified additional parameters of concern through a comparison of the 2013 water quality data to background water quality and the MOECC criteria listed in the Ontario Drinking Water Standards (ODWS) (MOECC, 2003, amended 2006). The comparison identified the following additional indicator parameters for identifying potential groundwater impacts from Facility operations: iron, manganese, dissolved organic carbon (DOC), sulfate, and total dissolved solids (TDS).

Ammonia and DOC are direct indicators of groundwater quality impacts associated with the discharge of organic waste related contaminants to the subsurface. Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within

the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Figures 4.5 through 4.8 provide concentration isopleths (lines of inferred equal concentration) for ammonia, dissolved iron, dissolved manganese, and DOC. The 2017 median concentrations from the shallow unconfined aquifer unit monitoring wells have been used to create the isopleths. Concentration isopleth figures are useful for evaluating and presenting spatial patterns in groundwater chemistry.

On Figures 4.5 and 4.8, the presence of elevated concentrations of the indicator parameters are identified in close proximity to or just downgradient from the Facility. The elevated concentrations appear to extend from the Facility to the east-northeast following the direction of groundwater flow. Some decrease in concentrations are observed with increased distance from the facility (following the path of groundwater flow in the shallow unconfined aquifer) and concentrations remain low to the west, south, and southeast of the Facility. Please note that due to the highly elevated median concentrations of ammonia and DOC from EW107-15 that location has not been included in the contouring presented in Figures 4.5 and 4.8. Further discussion of the extraction well is provided in Section 5.

The pattern of iron and manganese concentrations presented on Figures 4.6 and 4.7 is different than that observed during previous monitoring periods in that the concentrations reported in close proximity to the Facility are lower than those reported at the downgradient Site boundary. This change in the distribution of elevated iron and manganese may be due to efforts by Orgaworld to control the source of impact to the subsurface or due to active groundwater extraction in this vicinity during 2016 and 2017. Continued monitoring will provide insight into the evolution of these parameters near and downgradient from the Facility.

This distribution of elevated concentrations of ammonia, DOC, and to a lesser extent iron, and manganese is consistent with a contaminant plume related to an organic contaminant source emanating from the Facility.

The 2017 median concentrations show that elevated DOC, iron, and manganese concentrations extend to MW103-09, located in the northeastern corner of the Site, but that elevated ammonia is limited to the western side of the stormwater management pond or the Northern Ditch (in the vicinity of MW102-09). This indicates that there may be an additional source of DOC, iron and manganese contributing to the elevated concentrations at MW103-09.

Figures 4.9.1 to 4.9.12 present the evolution of groundwater chemistry at the wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

The following tables provide summaries of the trends and concentration ranges for ammonia, DOC, iron, and manganese in the shallow unconfined aquifer:

Location	Trend	Ammonia Concentration Range (mg/L)	
		Historic (pre-2017)	**2017**
MW4-09	stable	ND(0.050) – 0.117	ND(0.020) – 0.294
MW3-08	↑	ND(0.020) – 0.123	0.111 – 0.264
MW2-08	↑	ND(0.020) – 0.105	0.038 – 0.161
EW107-15	↑	0.123 – 51.3	14.1 – 88.0/91.1
MW105-13	↓	4.88 – 76.0	5.48/5.65 – 45.6
MW101-13	stable	0.237 – 34.9	9.25 – 15.9
MW104-13	↓	1.20 – 14.3	2.62 – 5.09
MW5-09	↑ and ↓ (2015-2017)	0.32 – 31.4	8.11 – 13.0
MW102-09	↑	ND(0.050) – 10.6	6.61 – 7.54
MW1-08	Stable to ↑	0.335 – 2.08J	1.14
MW103-09	Stable	0.508 –2.35	0.820/0.821 – 1.51
MW106-15	↓	1.91 – 10.0	1.96 – 3.92

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

As presented above, each of the upgradient locations have shown relatively stable and low ammonia levels. MW2-08 is located cross-gradient from the Facility and has shown little evidence of impacts. Ammonia concentrations at MW2-08 have remained consistently very low to non-detect.

During the 2017 reporting year, overall trends of ammonia concentrations have been decreasing particularly near the facility and downgradient. Ammonia concentrations at MW105-13 and MW101-13 previously showed increasing trends. Current analytical data indicates declining and stable trends at each facility area well. The analytical database for EW107-15 is limited; however, concentrations have fluctuated during the period of operation of this extraction well. Continued monitoring is required to determine/confirm the trend at the extraction well particularly during active pumping periods. Notwithstanding the fluctuations, the presence of elevated ammonia in the extraction well indicates that active groundwater extraction at this location is an appropriate remedial strategy.

Ammonia concentrations at MW5-09 followed a clear increasing trend between 2009 and mid-2015. Monitoring results from 2015 through 2017 demonstrate a reversal of this trend with decreasing ammonia levels from above 30 mg/L to below 10 mg/L. Orgaworld's efforts to eliminate the source of subsurface discharge and remediate the zone of elevated ammonia adjacent to the facility through operation of EW107-15 are likely responsible for the observed improvements in water quality at MW5-09.

With the exception of MW102-09 each of the downgradient monitoring locations continue to show overall stable or decreasing temporal trends in ammonia concentrations. MW5-09 and MW102-09

continue to exhibit elevated concentrations downgradient of the Facility and adjacent to the run-off ditches to the north the Site.

Location	Trend	Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)	
		Historic (pre-2017)	**2017**	**Historic (pre-2017)**	**2017**
MW4-09	↓	0.045 – 1.86	0.055 – 0.38	0.126 – 1.25	0.0711 – 0.127
MW3-08	↓	ND(0.010) – 1.04	ND(0.010)	ND(0.00050)– 0.0987	ND(0.0005)- 0.0185
MW2-08	↓ and stable	ND(0.010) – ND(0.10)	ND(0.010)	0.00072 – 0.177	0.00058 – 0.207
EW107-15	↑ and ↓	0.022 – 2.56	ND(0.10) – 1.14	0.065 – 4.52/4.57	0.189/0.191 – 1.03
MW105-13	↑ and ↓	0.080/0.095 – 7.61	1.41 – 4.46	0.413/0.443 – 1.06	0.145 – 0.382/0.385
MW101-13	↓	ND(0.050) – 34.5	0.157 – 0.344	0.0114 – 2.24	0.76 – 0.836
MW104-13	↓	0.071 – 23.9	0.573 – 3.43	0.548 -19.4	1.73 – 2.36
MW5-09	↑ and stable	1.99 – 14.5	3.38 – 5.40	2.45 – 5.33	1.09 – 2.50
MW102-09	↓ and ↑	ND(0.010) – 24.0/24.7	3.64 – 6.06	ND(0.00050) – 5.16	2.28 – 3.97
MW1-08	↓	0.897 – 16.6/17.2	6.21	0.539 – 10.9/11.0	1.19
MW103-09	↓	2.69 – 22.9/23.8	1.24/1.3 – 3.76	1.78 – 7.70/7.77	1.43/1.46 – 2.11
MW106-15	↑ and stable	0.838 – 4.66	3.57 – 6.05	1.06 – 2.62	1.19 – 1.52

Notes:
ND non-detect at the associated value

Elevated concentrations of dissolved iron and manganese are apparent in the facility area and downgradient of the facility, with the most elevated concentrations being reported at MW105-13, MW104-13, MW5-09, MW102-09, MW106-15, and MW1-08. As discussed above, iron and manganese concentrations in the interpreted source area adjacent to the facility were observed to decrease in 2017 as compared to previous monitoring years.

The principal observation with respect to trends in iron and manganese concentrations within shallow groundwater at the Site is that concentrations have generally followed trends of decreasing levels over time. The exception to this observation is near the downgradient Site boundary where iron concentrations continue to increase. It is expected that these concentrations will stabilize and decrease with time in response to Orgaworld's efforts to control releases to the subsurface.

Location	Trend	DOC Concentration Range (mg/L)	
		Historic (pre-2017)	**2017**
MW4-09	Stable	1.0 – 3.1	1.6 – 3.5
MW3-08	Stable	1.5 – 3.5/9.0	1.7 – 3.0
MW2-08	↑	1.5 – 10.0	6.4

Location	Trend	DOC Concentration Range (mg/L)	
EW107-15	↓*	3.2 – 965/1,030	5.6 – 33.4/33.8
MW105-13	Stable to ↑	2.6 – 9.3/9.4	4.2/4.3 – 16.0
MW101-13	Stable	3.6 – 14.8	5.3 – 11.2
MW104-13	↓	5.9 – 51.2	5.5 – 10.7
MW5-09	Stable	5.4 – 11.1/12.1	6.5 – 13.0
MW102-09	↓	ND(1.0) – 18.5	8.2 – 13.6
MW1-08	Stable	6.2 – 10.7	7.9
MW103-09	Stable	3.0/8.9 – 17.9	7.8 -10.5/10.6
MW106-15	Stable to ↑	8.0 – 13.0	11.3 – 11.7

Notes:
ND non-detect at the associated value.
* Initial DOC levels in August 2015 were highly elevated. Trend will be reassessed with further data.

The current levels of DOC have remained consistent with some minor decreasing trends. Concentrations of DOC are relatively low in the upgradient monitoring wells. Monitoring wells located downgradient of the Facility had previously demonstrated trends of elevated and increasing levels of DOC. Over the past monitoring year many of the concentrations have demonstrated decreasing or stable trends. Further sampling results are needed to establish the trend at EW107-15 following the initial August 2015 results being highly elevated. The 2017 DOC levels from this location fluctuated with slightly elevated concentrations in the summer samples.

In general, the increases in DOC concentrations downgradient of the facility relative to upgradient concentrations are minor compared to those observed for ammonia, iron or manganese.

Shallow Groundwater to Surface Water Discharge

In comments provided by the MOECC on the 2012 annual report, the MOECC requested that a comparison of shallow groundwater quality at MW103-09 to PWQOs be completed as part of the future annual monitoring reports. Table 4.2A provides the 2017 analytical data for MW103-09 along with the PWQOs for comparative reference, with exceedances highlighted.

As indicated in Table 4.2A, several parameters exceeded their respective PWQOs at MW103-09 during the current monitoring period. The following provides a summary of those exceedances:

- Iron – 3 of 3 samples
- Phosphorus – 2 of 3 samples
- Field Measured Dissolved Oxygen – 2 of 2 measurements

The Groundwater Assessment included recommendations to further investigate the relationship between shallow groundwater and surface water. Recommendations included that staff gauges be installed at four points within the northern ditch system and that a topographic survey of the northern portion of the Site be undertaken.

Topographic surveying of the northern ditch system (including the ditch which drains into the SWM Pond and the ditch that continues towards Findlay Creek – the HIP Ditch) was completed and the four staff gauges were installed in early 2015. The Site's northern ditch was dry at each of the staff gauge locations during each monitoring event in 2017, which provides some evidence that a significant volume of groundwater may not be continuously discharging to the creek.

Figure 4.10 presents the results of the topographic surveying of the northern ditch overlain by the June 1, 2017 groundwater contours. The topographic contours are provided in 0.5 m intervals with the lowest elevation presented representing the bottom of the ditch.

As shown in Figure 4.10, the topography of the ditches is 'w' shaped. The two ditch valleys or troughs travel parallel to the northern Site boundary with the on-Site ditch (that drains to the SWM Pond) found south of the HIP ditch. The inferred groundwater elevations from June 1, 2017 coincide closely with the bottom elevation of the ditches, and are above the bottom of the northern (roadside) ditch in several locations. These locations are illustrated on Figure 4.10 and are interpreted to be areas where shallow groundwater is discharging to the northern ditch. It should be noted that cattails and other hydrophyllic vegetation are present in portions of this ditch providing further support to this interpretation.

Figure 4.10 further shows that the total area where groundwater elevations are higher than the ditch bottom increases with proximity to the pond (the fall in the ditch is greater than the drop on groundwater elevation). Therefore, groundwater is likely discharging to the ditch during periods of high groundwater levels (typically during the spring freshet). This seepage is likely to be more prevalent closer to the stormwater pond.

However, as noted above each of the staff gauge locations did not contain sufficient standing or flow water for sampling during the 2017 monitoring events. Based on the information available, the volume of groundwater seeping into the ditch is too low to maintain a consistent base flow. It is likely that groundwater seepage into the ditch is largely lost to evapotranspiration.

In conclusion, small volumes of groundwater are likely seeping to the north roadside ditch but the volumes are insufficient to form a base flow. Based on current available information, groundwater discharging to the ditch is unlikely to cause any adverse impacts to the surface water bodies in the vicinity of the Site.

4.2.2 Deep Bedrock Aquifer Groundwater Quality

Based on the available data for the deep bedrock aquifer, groundwater flow in the deep bedrock aquifer occurs to the southwest across the Site, as illustrated on Figures 4.3 and 4.4. According to their position relative to the Facility, the deep bedrock groundwater monitoring wells can be grouped as:

- Upgradient well: TW-7
- Downgradient wells: TW-4, TW-8

The discussion regarding the evolution of the selected parameters will be applied in the same way as for the shallow unconfined aquifer.

Tabulated analytical results for the deep bedrock aquifer from the 2017 sampling program are provided in Table 4.3.

Because the deep bedrock aquifer is a potential source of drinking water in the vicinity of the Site, Table 4.3 also provides a comparison of the deep bedrock water quality to the Ontario Drinking Water Quality Standards (ODWQS) (Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, MOECC, June 2003, revised June 2006).

Table 4.3 shows that several parameters have frequently been reported above their respective ODWQS in samples collected from each of the deep bedrock wells (TW-4, TW-7, and TW-8). The following provides a summary of the parameters reported above their ODWQS limits at least once in 2017:

Location	ODWQS Exceedances	
	June 2017	November 2017
TW-7 (upgradient)	Iron, manganese, turbidity (field)	Turbidity (field)
TW-4 (downgradient)	Manganese, alkalinity	Manganese, alkalinity, turbidity (field)
TW-8 (downgradient)	Manganese, iron, turbidity (field)	Manganese, turbidity (field)

ODWQS Operational Guidelines as well as the criteria for temperature and turbidity do not relate directly to water samples collected from monitoring wells. The criteria for each are included in the ODWQS as they related to the effectiveness of water treatment and are thus not relevant to samples collected from groundwater monitoring wells. Alkalinity and pH concentrations should be given consideration in the evaluation of water quality; however, the ODWQS established for these parameters are Operational Guidelines set for water treatment plant operations and are thus not directly relevant to evaluations of water quality samples from groundwater monitoring wells.

Table 4.3 shows that water quality within the deep bedrock aquifer has historically been poor. Based on the upgradient water quality from TW-7 and the surrounding land uses there are several potential upgradient sources of water quality impairments within this aquifer.

Water quality results from the both downgradient wells show that operations at the Facility are potentially degrading the already poor upgradient water quality. Figures 4.11.1 to 4.11.3 present the evolution of groundwater chemistry at the deep bedrock wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

		Ammonia Concentration Range (mg/L)		DOC Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2017)**	**2017**	**Trend**	**Historic (pre-2017)**	**2017**
TW-7	↑ to stable	ND(0.05) – 0.157	0.065 – 0.825	↓	2.8 -15.1	2.1 – 3.2
TW-4	↑ to stable	0.218 – 3.72	0.642 – 0.961	stable	4.4 – 8.0	5.4 – 6.4
TW-8	stable	<0.050 – 4.60	0.240 – 0.550	↓	1.9 – 13.5	2.2 – 2.6

		Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2017)**	**2017**	**Trend**	**Historic (pre-2017)**	**2017**
TW-7	↓	0.082 – 11.1	ND(0.010) – 1.47	↓	0.0470 – 1.71	0.199 – 0.0352
TW-4	↓	ND(0.050) – 3.30	0.016 - ND(0.10)	↑	0.496 – 1.94	1.21 – 1.63
TW-8	↓	ND(0.050) – 6.25	0.163 – 1.00	↓	0.0256 – 2.95	0.314 – 0.315

Concentrations of ammonia showed notable decreases between late 2014 and 2016 at downgradient monitoring wells; however, the presence of ammonia at concentrations elevated above upgradient levels suggests that Facility operations may have had a minor effect on water quality in the deep bedrock aquifer. Ammonia concentrations in the upgradient monitoring well have steadily remained below or near the detection limits, with the exception of the unusually elevated ammonia concentration in the November 2017 sample.

A pumping test completed in 2008 showed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. The overall pattern of groundwater quality within the deep bedrock aquifer suggests that water quality is naturally poor. It is recommended that monitoring results for downgradient deep bedrock aquifer monitoring wells continue to be reviewed and assessed for potential facility-related water quality impacts. If trends of deteriorating water quality are consistent, consideration should be given to undertaking further investigation or evaluating the need for a remedial strategy. Based on the monitoring results from the 2017 monitoring period, no additional investigation or remedial activities are necessary at this time.

4.2.3 Surface Water Quality

Analytical results for surface water samples collected from the storm water management pond (SW-4) and local ditch monitoring locations (SW-1 through SW-3) are presented in Table 4.4 and compared to the Provincial Water Quality Objectives (PWQO). The following table summarizes the surface water monitoring parameters that did not meet the PWQO during the 2017 sampling events.

Location	Parameter	PWQO (mg/L)	Spring (mg/L)	Fall (mg/L)
SW-2	Iron	0.3	0.356	0.585
SW-2	Phosphorus	0.01	0.0400	0.0226
SW-2	Escherichia Coli	100*	400*	180*
SW-3	Iron	0.3	0.375	0.624
SW-3	Phosphorus	0.01	0.0366	0.0174
SW-3	Escherichia Coli	100*	370*	210*

Location	Parameter	PWQO (mg/L)	Spring (mg/L)	Fall (mg/L)
SW-4	Phosphorus	0.01	0.0627	0.215/0.234

Notes:
*- Escherichia Coli concentrations are in colony forming units per 100 mL (CFU/100 mL)
0.0537/0.0653 indicates duplicate analytical results

In general, water quality at the downstream surface water monitoring location (SW-3) is similar to the upstream surface water monitoring location (SW-2), which indicates an upstream source impacting water quality.

Concentrations of phosphorus were consistently above the PWQO at each of the monitoring locations, with the exception of SW-1 in 2017. In addition, elevated iron concentrations were noted at SW-2 and SW-3. E. coli levels were in exceedance of the PWQO in all of the 2017 samples from SW-2 and SW-3.

Previous assessments of the Site concluded that concentrations of un-ionized ammonia were showing increases at SW-4. Temporal concentration versus time plots for ammonia, DOC, manganese, and iron levels at SW-4 are presented on Figure 4.12. Figure 4.12 shows that ammonia concentrations spiked throughout 2014 and during the fall of 2016. The fall 2017 results show a similar spike in elevated ammonia concentrations.

As discussed in Section 4.2.1, the potential for shallow groundwater to discharge to surface exists within the northern ditch and stormwater management pond. The presence of un-ionized ammonia at elevated concentrations in SW-4 is likely related to the discharge of impacted groundwater directly to the SWP or via overland flow of impacted runoff entering the pond.

A total of 10 additional samples were collected by Orgaworld staff at surface water monitoring location SW-4 during the 2017 monitoring period. Orgaworld staff collected monthly samples when the surface water was unfrozen. The analytical results for these samples have been included in Table 4.5 with results highlighted that did not meet their respective PWQO and the ECA discharge criteria. As indicated in Table 4.5, parameter concentrations that did not meet their respective PWQO were noted for:

- Chromium
- Escherichia Coli
- Phenols
- Total Phosphorus
- Un-Ionized Ammonia

Water was discharged from the stormwater management pond three times during the 2017 monitoring period in April, July, and December. The surface water quality results were compared to the trigger level parameters presented in the ECA prior to discharges to determine that the concentrations of trigger parameters were below the discharge criteria. All analytical results for samples collected prior to discharge were below their respective trigger levels. On this basis, all

stormwater management pond discharge events were in compliance with the ECA trigger levels (outlined in Table 2 of the ECA) during 2017.

Based on the results of the surface water monitoring, there were no measureable effects on downstream surface water quality from the discharges during the 2017 monitoring period.

5. Shallow Groundwater Extraction System

Beginning on October 4, 2016 regular pumping from shallow groundwater extraction well EW107-15 commenced. The daily volumes pumped from EW107-15 are summarized in Table 5.1. EW107-15 is only pumped on days when the Facility is staffed and as such the total available pumping days during 2017 was 258 days. Of those available days the well was pumping on 67 days with total volume pumped of 311 m^3 (average 1.20 m^3/day). The average volume pumped during the 67 days with pumping was 4.64 m^3/day.

As previously mentioned, EW107-15 was sampled three times during the current reporting period with all three samples collected via the dedicated sampling port. The following table provides a summary of the 2017 indicator parameters:

Parameter (mg/L)	June 2, 2017	August 30, 2017	November 30, 2017
Ammonia-N	14.1	91.1/88.0	33.3
Iron (dissolved)	0.304	ND(0.10)	1.14
Manganese (dissolved)	0.593	0.189/0.191	1.03
DOC	5.6	33.4/33.8	7.2

Notes:
0.0537/0.0653 indicates duplicate analytical results

There is a notable difference in the concentrations reported in the all three sample results. Groundwater quality at the Site is seasonally variable and the extent to which the groundwater extraction well was active prior to the sample collection, as shown in Table 5.1, also likely contributed to the variability in the results. The June sample was collected during a period of no pumping, the August sample was collected when the pumping was the greatest, and the November sample was collected following a period of relatively minor pumping.

There is currently insufficient data to quantify the effectiveness of the extraction well at controlling or reducing groundwater impacts at the Site, however water quality results for the 2016 and 2017 monitoring periods suggest some improvement in water quality in the vicinity of EW107-15. This improvement is likely related to active groundwater extraction within the interpreted historical source area. It is expected that continued operation of the shallow groundwater extraction well will, over time, remove the most impacted groundwater from the facility area. This will result in improved water quality in both the facility area and downgradient plume which should, in turn, reduce the occurrence of Tier I trigger exceedances.

Future assessments of water quality (i.e., the 2018 annual report) will be used to evaluate the effectiveness of the extraction well at controlling the downgradient migration of Facility-related groundwater quality impacts.

6. Compliance and Trigger Level Program

Condition 9(3b) of the amended ECA (2011) requires the development of trigger level criteria in accordance with MOECC Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). In a memorandum to the MOECC, dated February 27, 2015, GHD provided an outline for a recommended Compliance and Trigger Level Program (TLP). A copy of the memo is included in Appendix B1. The memo provides a detailed history of developing the TLP as well as the three tiered approach to evaluating compliance at the Site.

The following Sections provide a brief summary of the key points of the TLP and an assessment of the current water quality.

6.1 Trigger Parameters

A focused set of parameters which are related to the sources of potential impacts from on-Site activities were selected for the purposes of the TLP. The TLP parameter list includes the following trigger parameters: ammonia, phosphorus, DOC, nitrate, iron, manganese, alkalinity, and Escherichia Coli. Ammonia, phosphorus, DOC, nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic sources due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

6.2 Trigger Concentrations

The following table provides the trigger levels for the above-referenced trigger parameters.

The trigger levels for the shallow unconfined aquifer are based on the 95 percent upper-tolerance limits (UTLs) for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.). More detail on how the trigger concentrations were calculated is provided in Appendix B1.

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the deep bedrock aquifer. As an alternative, 95 percent UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.)

The following table provides the trigger levels for the above-referenced trigger parameters for the shallow and deep bedrock aquifer units.

Parameter	Shallow Unconfined Aquifer Trigger Level	Deep Bedrock Aquifer Trigger Level
Ammonia	4.0 mg/L	0.2 mg/L
Phosphorus	7.2 mg/L	0.5 mg/L
Dissolved Organic Carbon	34.6 mg/L	18.4 mg/L
Nitrate	1.3 mg/L	0.5 mg/L
Iron	48.3 mg/L	10.6 mg/L
Manganese	17.1 mg/L	2.1 mg/L
Alkalinity	633 mg/L	996 mg/L
Escherichia Coli	25.6 CFU/100 mL	5.0 CFU/100 mL

6.3 Trigger Level Assessment

The first Tier of the TLP consists of regular quarterly and semi-annual monitoring as outlined in Table 3.1. The second Tier of the TLP will be implemented if during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location. The tabulated analytical results for the shallow unconfined aquifer and deep bedrock aquifers (Tables 4.2 and 4.3, respectively) have been updated to include the trigger concentrations.

Tier II confirmatory monitoring consists of collecting follow-up water quality samples in duplicate from the location(s) that exceed the Tier I trigger levels. The Tier II confirmatory monitoring will be carried-out during the next scheduled monitoring event. Tier I monitoring will resume following confirmatory samples below the Tier I trigger levels.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

Shallow Unconfined Aquifer Assessment

The following table summarizes the results of the shallow unconfined groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2017 Tier	Trigger Level Exceedances			2016 Tier
		June	**August**	**November**	
MW1-08	I	None	-	-	I
MW2-08	I	None	-	None	I

Location ID	2017 Tier	Trigger Level Exceedances			2016 Tier
		June	**August**	**November**	
MW5-09	I	Ammonia	Ammonia	Alkalinity, Ammonia	II
MW101-13	II*	Ammonia	Ammonia	-	I
MW102-09	I	Ammonia	Ammonia	Alkalinity, Ammonia	II
MW103-09	I	None	-	None	I
MW104-13	II*	None		Ammonia	I
MW105-13	I	Ammonia	Alkalinity, Ammonia	Alkalinity, Ammonia	II
MW106-15	I	None	None	None	I

As indicated in the above table, ammonia and nitrate concentrations were reported above their recommended trigger levels at several locations during 2017. In addition, the samples collected from the extraction well, EW107-15, indicated concentrations of ammonia above the trigger limit. In four instances (MW5-09 in November, MW102-09 in November, and MW105-13 in August and November), two parameters were above their trigger limits during the same monitoring event, thus, triggering the need for a Tier II response. The August trigger level exceedances from MW105-13 persistent into November. All three locations that triggered Tier II sampling should be completed during the spring 2018 event.

It should be noted that the Site initiated a program of groundwater remediation in 2016 in response to elevated ammonia concentrations in shallow groundwater near and downgradient of the facility. Operation of this system represents implementation of the contingency remedial response to observed groundwater quality impacts. Accordingly, future trigger level assessments should be undertaken for the purpose of tracking the evolution of groundwater quality as it relates to the remedial response, and should not be used for the purpose of triggering additional remedial response.

Deep Bedrock Aquifer

The following table summarizes the results of the deep bedrock groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2017 Tier	Trigger Level Exceedances		2016 Tier
		June	November	
TW-7	I	None	Ammonia	I
TW-4	I	Ammonia	Ammonia, Nitrate	II
TW-8	I	Ammonia	Ammonia, Nitrate	II

All three bedrock locations were sampled under the normal Tier I sampling frequency in 2017. Concentrations of ammonia and nitrate concentrations exceeded their respective deep bedrock Tier I trigger levels at TW-4 and TW-8 in the fall 2017 samples. Thus, it is recommended that that Tier II sampling be initiated at both these locations in the spring of 2018.

7. Conclusions

The following conclusions have been developed based on results of the groundwater and surface water monitoring and sampling activities conducted in 2017:

1. Based on the groundwater elevations gathered in June and November 2017, shallow unconfined aquifer flow occurs in an east-northeast direction and groundwater in the deep bedrock aquifer flows in a west-southwest direction, opposite to the direction of the shallow unconfined aquifer.
2. Analytical results for the shallow unconfined aquifer samples indicate that groundwater quality at the Site is being altered by Facility operations. The distribution of elevated concentrations of ammonia, DOC, iron, and manganese are consistent with a contaminant plume related to an organic contaminant source emanating from the Facility.
3. Analytical sample results obtained from the deep bedrock aquifer unit monitoring wells indicate that groundwater quality in the deep bedrock aquifer is naturally poor. Increasing trends of ammonia concentrations during previous monitoring periods have been observed downgradient of the Facility, however recent results show a reversal in these trends.
4. Surface water sample results indicate that surface water quality downstream of the Site was unaltered by Site activities during the 2017 monitoring period.
5. Surface water was discharged three times from the on-Site Stormwater Management Pond during the 2017 monitoring period (April, July, and December). In the April, July, and December samples collected from the Stormwater Management Pond all parameters were below their respective trigger levels listed in the Site ECA.

8. Recommendations

Based on the results of the water quality monitoring program conducted at the Facility, the following recommendations are presented:

1. Operation of the groundwater extraction system should continue, removing as much impacted groundwater from the shallow flow system as is practical.
2. Future monitoring reports should assess the effectiveness of the extraction well and provide recommendations for continued operation or expansion, as appropriate, of the current remediation system.
3. Tier II confirmatory sampling should be completed during the spring 2018 sampling event at MW5-09, MW102-09, MW105-13, TW-4, and TW-8.

Notes:

(1) General chemistry parameters - alkalinity, ammonia, DOC, nitrate, phosphorus turbidity, and un-ionized ammonia
(2) Additional Surface Water General Chemistry parameters analyzed at SW-4 during monthly sampling - BOD, COD, TKN, nitrite, total phenols, TSS, oil & grease, pH, arsenic, boron, cadmium, chromium, cobalt, copper, lead, mercury, nickel, zinc
(3) Metals - iron and manganese
(4) Surface water metals are total while groundwater metals are dissolved.
(5) 5 Escherichia coli (e.coli)
(6) SW-4 is sampled by CRA field staff on a bi-annual basis and monthly by Orgaworld staff (when it's safe to do so)
X Samples to be collected tri-annually (spring, summer, and fall)
√ Samples to be collected semi-annually (spring and fall)

002309

Groundwater Elevations
2017 Groundwater and Surface Water Monitoring Report
Orgaworld Canada Ltd.
5123 Hawthorne Road, Ottawa, ON

Location	Reference Elevation [1] [2] (m AMSL)	June 1-2, 2017		August 30, 2017		November 29-30, 2017	
		Depth to Water From Reference (m)	Groundwater Elevation (m AMSL)	Depth to Water From Reference (m)	Groundwater Elevation (m AMSL)	Depth to Water From Reference (m)	Groundwater Elevation (m AMSL)
Unconfined Shallow Groundwater Elevations

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 2844-9YNGZC
Issue Date: February 1, 2017

Orgaworld Canada Ltd.
150 Kent Street
London, Ontario
N6A 1L3

Site Location: Source Separated Organics Processing Facility
5123 Hawthorne Road South
Part of West Half of Lot 27, Concession 6
City of Ottawa
K1G 3Y3

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

existing sewage works for the collection, transmission, treatment and disposal of stormwater runoff & process / wash water from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central stormwater management (SWM) facility off-site (i.e. at the adjacent Hawthorne Industrial Park) which subsequently discharges to the Findlay Creek through a roadside ditch, for all storm events up to and including the 100 year return storm, consisting of the following:

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.

- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.

- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters

below trigger levels.

Part I Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	**Elevation** (metre)	**Storage Volume** (cubic metres)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:

    - inlet structure: A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;

    - overflow channel: A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.

- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;

- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.

- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.

- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide

over 80% total net annual TSS removal, discharging to a forebay of the wet pond;

- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;

- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.

- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

Part II Process Water Recirculation System

- a **Process Water Recirculation System** (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:

- six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;

- four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;

- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.

- piping for percolate/washdown water supply to the composting area including a sprinkling system;

- an odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water

and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned Works.

all in accordance with supporting documents listed in Schedule 'A'.

For the purpose of this environmental compliance approval, the following definitions apply:

"Application" means the application for an environmental compliance approval submitted to the Ministry for approval by or on behalf of the Owner and dated March 11, 2015;

"Approval" means this entire document and any schedules attached to it, and the Application;

"BOD_5"(also known as $TBOD_5$) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"$CBOD_5$"means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"COD" means Chemical Oxygen Demand;

"District Manager" means the District Manager of the Ottawa District Office of the Ministry;

"DOC" means Dissolved Organic Carbon;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for the purposes of Part II.1 of the EPA;

"*E. coli* " refers to the thermally tolerant forms of Escherichia that can survive at 44.5 degrees Celsius;

"EPA" means the *Environmental Protection Act, R.S.O. 1990, c.E.19* , as amended;

"Leachate Contaminated Sewage"means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Owner" means Orgaworld Canada Ltd., and its successors and assignees;

"OWRA" means the *Ontario Water Resources Act, R.S.O. 1990, c. O.40* , as amended;

"Substantial Completion" has the same meaning as "substantial performance" in the *Construction Lien Act* ; and

"Works" means the sewage works described in the Owner's application, and this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the terms and conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these terms and conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with this Approval.

(3) Where there is a conflict between a provision of this environmental compliance approval and any document submitted by the Owner, the conditions in this environmental compliance approval shall take precedence. Where there is a conflict between one or more of the documents submitted by the Owner, the Application shall take precedence unless it is clear that the purpose of the document was to amend the Application

(4) Where there is a conflict between the documents listed in the Schedule A, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The terms and conditions of this Approval are severable. If any term and condition of this environmental compliance approval, or the application of any requirement of this environmental compliance approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

(6) The issuance of, and compliance with the conditions of, this Approval does not:

(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement, including, but not limited to, the obligation

to obtain approval from the local conservation authority necessary to construct or operate the sewage Works; or

(b) limit in any way the authority of the Ministry to require certain steps be taken to require the Owner to furnish any further information related to compliance with this Approval.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of address of Owner or operating authority;

(b) change of Owner or operating authority or both, including address of new Owner or operating authority, or both;

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the *Business Names Act, R.S.O. 1990, c. B.17* ; and

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the "Initial Return" or "Notice of Change" filed under the *Corporations Information Act, R.S.O. 1990, c. C.39* , shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the Works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this condition refer to the number at the top of this environmental compliance approval.

3. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the Substantial Completion of the Works,a set of as-built drawings showing the Works as "constructed" shall be completed and submitted by the Owner to the District Manager.These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the Works or at operational office of the Owner for the operational life of the Works.

(2) The Owner shall inform in writing to the District Manager when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The Owner shall inform the District Manager of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

4. SURFACE WATER MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganic**	**Field Parameters**
BOD_5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen (TAN)	Chromium	Temperature
Total Kjeldahl Nitrogen (TKN)	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus (TP)	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after **two (2) years** of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The Owner shall retain for a minimum of **five (5) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

5. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(4) The Owner shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the Owner shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 4.(2). The Owner shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N	2.93
$CBOD_5$	15
Total Phosphorus (TP)	0.4
Total Suspended Solids (TSS)	15
E-coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the Owner shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 5.(2) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the Owner shall ensure that the contents of the SWM Pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner.

(8) The Owner shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to.

(9) Discharge of leachate contaminated sewage from the Works to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

(10) The Owner shall notify the District Manager orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The Owner shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation.

(13) The Owner shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or Owner's operational headquarters for inspection by the Ministry.The logbook shall include the following:

(a) the name of the Works;

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The Owner shall not store any end-product, including leaves and yard waste outdoors until the Owner prepares a Conditions Assessment and implementation plan approved by the District Manager. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

6. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

PART IV - GENERAL

7. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the Works, the Owner shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall

include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the Owner.

9. GROUNDWATER MONITORING

Groundwater Monitoring Program

(1) The Owner shall, upon the issuance of this Approval, carry out the following groundwater monitoring program. Samples shall be collected from the specified groundwater monitoring wells at the frequency specified, by means of the specified sample type and analyzed for each parameter listed and all results recorded:

Table 3 - Groundwater Monitoring

Unconfined Shallow Aquifer

MW1-08*, MW2-08*, MW3-08*, MW4-09*, & MW103-09*.

MW5-09**, MW101-13**, MW102-09**, MW104-13**, MW105-13**, MW106-15** & EW107-15**.

Deep Bedrock Aquifer

TW-4*, TW-7* & TW-8*.

Frequency	*Semi Annual (i.e. two times in a year) ** Tri-Annual (i.e. three time in a year)
Sample Type	Grab
Parameters	Alkalinity, Total Ammonia Nitrogen, Dissolved Organic Carbon, *E-coli* , Iron, Manganese, Nitrate-N, and Total Phosphorous.

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after three (3) years of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall compare analytical monitoring results obtained pursuant to Subsection (1) Table 3 - Groundwater Monitoring with the trigger level concentrations for the trigger parameter listed in Tables 4 and 5.

Table 4
Trigger Level Concentrations
Unconfined Shallow Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	633
Total Ammonia Nitrogen	4.0
Dissolved Organic Carbon	34.6
E-coli	25.6 CFU/100 mL
Iron	48.3
Manganese	17.1
Nitrate-N	1.3
Total Phosphorous	7.2

Table 5
Trigger Parameters
Deep Bedrock Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	996
Total Ammonia Nitrogen	0.2
Dissolved Organic Carbon	18.4
E-coli	5.0 CFU/100 mL
Iron	10.6
Manganese	2.1
Nitrate-N	0.5
Total Phosphorous	0.5

(5) The trigger level program shall be implemented using the following three (3) Tiers to verify the results and direct potential contingency implementation:

Tier I (Routine Monitoring Program)

Tier I Routine Monitoring Program (RMP) involves the sampling of all on-site groundwater monitoring wells at the frequency specified in Table 3. All groundwater monitoring activities completed at the site will be considered Tier I RMP unless two (2) or more trigger parameters exceed there respective trigger levels in a simple sample.

Tier II (Confirmation Monitoring Program)

If during a single monitoring event, two (2) or more trigger parameters exceed the established (see Tables 4 and 5) Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring Program (CMP) shall be implemented.

The Tier II CMP consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next schedule monitoring event in order to confirm the Tier I exceedance of the two (2) or more trigger parameters.

If the concentrations reported in the duplicate sample return to below their respective trigger levels, then Tier I RMP will resume.

If the Tier I exceedance is confirmed, then the next step shall be a re-evaluation of the degree, nature, and potential source(s) of the trigger level impact(s) identified in Tier I including the implication of the exceedance in terms of the potential for impacts to down-gradient off-site water users.

If the Tier II CMP and the subsequent evaluation indicate that the facility operations are having a detrimental effect on water quality migrating off-site, then Tier III Contingency Measures and Compliance Monitoring Program shall be implemented.

Tier III (Contingency Measures and Compliance Monitoring Program)

Tier III Contingency Measures and Compliance Monitoring Program (CMCMP) involves assessment and implementation of contingency measures in the event of imminent off-site groundwater quality impairment.

Contingency measures to be evaluated should include extraction of impacted groundwater and/or surface water for on-site treatment or off-site disposal, or acquisition of groundwater rights and registration of a contaminated attenuation zone (CAZ) on title of adjacent lands.

Tier III CMCMP should also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented.

The Tier III CMCMP details should be determined in conjunction with the development and implementation of preferred contingency measure(s).

The compliance monitoring parameters, locations, and monitoring frequency should be determined at the time of implementation of contingency measures.

Lastly, appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed.

(6) The Owner shall notify the District Manager orally, as soon as possible, and in writing within

seven (7) days in the event a trigger exceedance occurs.

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

10. REPORTING

(1) The Owner shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to Ministry staff.

(2) The Owner shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the Works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the Works;

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the District Manager requires from time to time.

SCHEDULE 'A'

1. Environmental Compliance Approval Application for Industrial Sewage Works submitted by Ben Constable, Conestoga-Rovers & Associates (CRA), and signed by Mike Rooke, Compliance Officer, Orgaworld Canada Ltd., dated March 11, 2015, and all supporting documentation and information.

2. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

3. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

4. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

5. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

6. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

7. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

8. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

9. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

10. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

11. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla,

P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

12. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

13. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

14. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

15. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

16. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. Condition 1.(6) is included to emphasize that the issuance of this Approval does not diminish any other statutory and regulatory obligations to which the Owner is subject in the construction, maintenance and operation of the Works. The condition specifically highlights the need to obtain any necessary conservation authority approvals. The condition also emphasizes the fact that this Approval doesn't limit the authority of the Ministry to require further information.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved Works and to ensure that subsequent owners of the Works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is included to ensure that the Works are constructed in accordance with the approval and that record drawings of the Works"as constructed" are maintained for future references.

4. Conditions 4 and 8 are included to enable the Owner to evaluate and demonstrate the performance of the Works,on a continual basis, so that the Works are properly operated and maintained at a level which is consistent with the design objectives specified in the Approval and that the Works does not cause any impairment to the receiving watercourse.

5. Conditions 5, 6 and 7 are included to require that the Works be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the Ministry.

6. Condition 9 is included to provide a performance record for future references, to ensure that the Ministry is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this Approval, so that the Ministry can work with the Owner in resolving any problems in a timely manner.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 7251-8GKRPD issued on May 30, 2011.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

1. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The environmental compliance approval number;
6. The date of the environmental compliance approval;
7. The name of the Director, and;
8. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment and Climate Change
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 314-4506 or www.ert.gov.on.ca**

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 1st day of February, 2017

Fariha Pannu.

Fariha Pannu, P.Eng.
Director
appointed for the purposes of Part II.1 of the
Environmental Protection Act

AA/
c: District Manager, MOECC Ottawa District Office
Ben Constable, Conestoga-Rovers & Associates (CRA)

Ministry of the Environment
Ministère de l'Environnement

AMENDED CERTIFICATE OF APPROVAL
INDUSTRIAL SEWAGE WORKS
NUMBER 7251-8GKRPD
Issue Date: May 30, 2011

Orgaworld Canada Ltd.
4675 Wellington Rd S
London, Ontario
N6K 0C7

Site Location: 5123 Hawthorne Road South
Lot Part of West Half of 27, Concession 6
Ottawa City,
K1G 3Y3

You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

the establishment of stormwater management *Works* for the collection, transmission, treatment and disposal of stormwater runoff and process/wash sewage from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central SWM facility off site (adjacent Hawthorne Industrial Park), and subsequently discharging through a ditch to Findlay Creek, for all storm events up to and including the 100 year return storm, consisting of the following:

PROPOSED WORKS

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.
- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.
- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters below trigger levels.

EXISTING WORKS

Part 1 Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	Elevation (m)	Storage Volume (m^3)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:
    1. Inlet structure. A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;
    2. Overflow channel. A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.
- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;
- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.
- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.
- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide over 80% total net annual TSS removal, discharging to a forebay of the wet pond;
- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;
- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.
- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

The above, including erosion/sedimentation control measures during construction and all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

Part II <u>Process Water Recirculation System</u>

- A Process Water Recirculation System (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:
- Six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;
- Four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;
- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.
- Piping for percolate/washdown water supply to the composting area including a sprinkling system;
- An odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- Piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

All in accordance with the following submitted supporting documents:

1. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

2. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

3. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

4. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

5. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

6. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

7. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

8. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

9. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

10. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

11. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

12. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

13. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

14. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

15. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

CONTENT COPY OF ORIGINAL

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"*Act*" means the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, as amended;

"*BOD5*" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"*CBOD5*" means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"*Certificate*" means this entire certificate of approval document, issued in accordance with Section 53 of the *Act*, and includes any schedules;

"*COD*" means Chemical Oxygen Demand;

"*Director*" means any *Ministry* employee appointed by the Minister pursuant to section 5 of the *Act*;

"*District Manager*" means the District Manager of the Ottawa District Office of the Ministry;

"*DOC*" means Dissolved Organic Carbon;

"*Leachate Contaminated Sewage*" means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"*Ministry*" means the Ontario Ministry of the Environment;

"*Owner*" means Orgaworld Canada Ltd., also referred as OCL, and includes its successors and assignees;

"*Substantial Completion*" has the same meaning as "*substantial performance*" in the Construction Lien Act; and

"*Works*" means the sewage works described in the *Owner's* application, this *Certificate* and in the supporting documentation referred to herein, to the extent approved by this *Certificate.*

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL PROVISIONS

(1) The *Owner* shall ensure that any person authorized to carry out work on or operate any aspect of the *Works* is notified of this *Certificate* and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these Conditions, the *Owner* shall design, build, install, operate and maintain the *Works* in accordance with the description given in this *Certificate* the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this *Certificate.*

(3) Where there is a conflict between a provision of any submitted document referred to in this *Certificate* and the Conditions of this *Certificate*, the Conditions in this *Certificate* shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the listed submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The requirements of this *Certificate* are severable. If any requirement of this *Certificate*, or the application of any

requirement of this *Certificate* to any circumstance, is held invalid or unenforceable, the application of such requirement to other circumstances and the remainder of this certificate shall not be affected thereby.

2. EXPIRY OF APPROVAL

The approval issued by this *Certificate* will cease to apply to those parts of the *Works* which have not been constructed within **five (5) years** of the date of this *Certificate.*

3. CHANGE OF OWNER

(1) The *Owner* shall notify the *District Manager* and the *Director*, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of *Owner;*

(b) change of address of the *Owner;*

(c) change of partners where the *Owner* is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Business Names Act, R.S.O. 1990, c.B17 shall be included in the notification to the *District Manager;*

(d) change of name of the corporation where the *Owner* is or at any time becomes a corporation, and a copy of the most current information filed under the Corporations Information Act, R.S.O. 1990, c. C39 shall be included in the notification to the *District Manager;*

(2) In the event of any change in ownership of the *Works*, other than a change to a successor municipality, the *Owner* shall notify in writing the succeeding owner of the existence of this *Certificate*, and a copy of such notice shall be forwarded to the *District Manager* and the *Director.*

4. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the *Substantial Completion* of the *Works*, a set of as-built drawings showing the *Works* as "constructed" shall be completed and submitted by the *Owner* to the *District Manager.* These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the *Works* or at operational office of the *Owner* for the operational life of the *Works.*

(2) The *Owner* shall inform in writing to the *District Manager* when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The *Owner* shall inform the *District Manager* of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

5. SURFACE WATER MONITORING AND RECORDING

(1) The *Owner* shall, upon commencement of operation of the *Works*, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganics**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's Procedure F-10-1, "Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works (Liquid Waste Streams Only), as amended from time to time by more recently published editions;

(b) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (January 1999), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(c) the publication "Standard Methods for the Examination of Water and Wastewater" (20th edition), as amended from time to time by more recently published editions;

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after two (2) years of operation of the *Works* in accordance with this Condition, be modified by the *District Manager* in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The *Owner* shall retain for a minimum of **three (3) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this *Certificate*.

6. OPERATION AND MAINTENANCE

(1) Up on commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* prepared in accordance with Condition (8) is submitted to the *District Manager* for comments and concurrance;

(2) Upon commencement of operation of the *Works*, the *Owner* shall implement all operating procedures identified in the operations manual. This manual shall include, but not necessarily be limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

(4) The *Owner* shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the *Owner* shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 5(2). The *Owner* shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the *Owner* shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 6 (1) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the *Owner*shall ensure that the contents of the SWM pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner;

(8) The *Owner*shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to;

(9) Discharge of leachate contaminated sewage from the *Works*to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage;

CONTENT COPY OF ORIGINAL

(10) The *Owner* shall notify the *District Manager* orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The *Owner* shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The *Owner* shall inspect the *Works* at least once a year and, if necessary, clean and maintain the *Works* to prevent the excessive build-up of sediments and/or vegetation.

(13) The *Owner* shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or *Owner's* operational headquarters for inspection by the *Ministry*. The logbook shall include the following:

(a) the name of the *Works;*

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The *Owner* shall not store any end-product, including leaves and yard waste outdoors until the *Owner* prepares a Conditions Assessment and implementation plan approved by the *District Manager*. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

7. OPERATION AND MAINTENANCE

(1) Before the commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* is prepared as per Condition (8), submitted to the *District Manager;*

(2) Up on commencement of operation of the *Works*, the *Owner* shall implement all operational procedures identified in the operation manual. The operation manual shall include, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

CONTENT COPY OF ORIGINAL

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

PART IV - GENERAL

8. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the *Works,*the *Owner*shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the

CONTENT COPY OF ORIGINAL

operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the *Owner*.

9. GROUNDWATER MONITORING

Upon issuance of this *Certificate*, the *Owner* shall establish the following groundwater monitoring program with monitoring wells located as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates.

(1) For the unconfined shallow groundwater aquifer, the *Owner* shall establish and maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing eight (8) monitoring wells designated as: MW1-08 to MW5-08; and MW101 to MW103 and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(2) For the confined deep bedrock aquifer, the *Owner* shall maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing three (3) monitoring wells designated as: TW-4, TW-7, and TW-8 (within the Orgaworld Canada Ltd. site), and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(3) Within **sixty (60) days** of the issuance of this Certificate, the *Owner* shall:

(a) complete an assessment of the groundwater quality for each stratrigraphic unit:

(b) develop criteria in accordance with the Ministry Guideline B-7 - Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities; and

(c) submit to the *District Manager* for review and concurrence.

(4) The *Owner* shall collect groundwater samples twice per year - in May and November - from the monitoring wells listed at subsections (1) and (2), and increase the sampling frequency to four times per year - in February, May, August and November - for the three new wells MW101, MW102, and MW103.

(5) The Owner shall have the samples collected pursuant to subsection (2) filtered and analyzed for Alkalinity, Colour, Iron, Manganese, Cadmium, Molybdenum, Zinc, Petroleum Hydrocarbons fractions, Anthracene, arsenic, E.Coli, feacal coliforms, total coliforms, Total Disssolved Solids (TDS), DOC, turbidity, pH, CBOD5, temperature, using the analytical protocols listed at Condition 5 (2).

(6) The Owner shall measure the water level elevation in each of the monitoring wells identified in subsection (1) and (2) at the time of collection of water samples pursuant to subsections (4).

(7) The measurement frequencies specified in subsection (4) in respect of any parameter are minimum requirements which may, after **two (2) years** of operation of the Works, be modified by the *District Manager* in writing from time to time.

(8) After **two (2) years** of operation of the *Works*, the *Owner* shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this *Certificate* to the *Director* and the *District Manager*.

10. REPORTING

(1) **One (1) week** prior to the start up of the operation of the *Works*, the *Owner* shall notify the *District Manager* (in writing) of the pending start up date.

(2) The *Owner* shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to *Ministry* staff.

(3) The *Owner* shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the

period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the *Works*and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works;*

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the *District Manager*requires from time to time.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the *Works*are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the *Certificate*and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. The condition also advises the Owners their responsibility to notify any person they authorized to carry out work pursuant to this *Certificate*the existence of this *Certificate.*

2. Condition 2 is included to ensure that, when the *Works*are constructed, the *Works*will meet the standards that apply at the time of construction to ensure the ongoing protection of the environment.

3. Condition 3 is included to ensure that the *Ministry*records are kept accurate and current with respect to the approved works and to ensure that subsequent owners of the *Works*are made aware of the *Certificate*and continue to operate the *Works*in compliance with it.

4. Condition 4 is included to ensure that the *Works*are constructed in accordance with the approval and that record drawings of the *Works*"as constructed" are maintained for future references.

5. Conditions 5 and 9 are included to enable the *Owner*to evaluate and demonstrate the performance of the *Works,*on a continual basis, so that the *Works*are properly operated and maintained at a level which is consistent with the design objectives specified in the *Certificate*and that the *Works*does not cause any impairment to the receiving watercourse.

6. Conditions 6, 7 and 8 are included to require that the *Works*be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the *Ministry.*

7. Condition 10 is included to provide a performance record for future references, to ensure that the *Ministry*is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this *Certificate,*so that the *Ministry*can work with the *Owner*in resolving any problems in a timely manner.

This Certificate of Approval revokes and replaces Certificate(s) of Approval No. 7032-88XPRA issued on September 7, 2010.

CONTENT COPY OF ORIGINAL

written notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 101 of the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

1. The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Certificate of Approval number;
6. The date of the Certificate of Approval;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/28	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Recommended Compliance and Trigger Level Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline a recommended groundwater Compliance and Trigger Level Program (TLP) for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Facility) located at the 5123 Hawthorne Road, Ottawa, Ontario (Site). The TLP has been developed to satisfy Condition 9(8) of the Environmental Compliance Approval (Industrial Sewage Works No. 7251-8GKRPD) (ECA) for the Site and is being submitted in support of an application to amend the ECA. The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

The following Section discusses the results of previous assessments of groundwater compliance and trigger level assessments for the Site. A recommended TLP for the Site is presented in Section 3.0.

2.0 Background

The OCL Site is approximately 10 hectares in area and is situated in the southwest corner of the Hawthorne Industrial Park (HIP) subdivision, which covers an area of approximately 80 hectares. Since the early/mid 1990's, the HIP subdivision has historically received excess fill materials from various construction and demolition projects, which is understood to consist primarily of clean soil with some concrete debris and reclaimed asphalt pavement and aggregate materials, and has also been intermittently used for temporary storage of various construction related materials. The area surrounding the HIP subdivision has a number of mineral aggregate extraction operations in place (south-east, west, and north-west of HIP), some of which are still active. The OCL Site was also subject to mineral aggregate removals prior to Facility development by OCL. Given the historic and ongoing land uses around the subject Site, there is the potential for soil, groundwater, and surface water quality impairment related to the various past activities.

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

As part of the ECA development for this Site, the MOE requested a groundwater monitoring program be implemented to ensure that the proposed operation of the OCL Facility does not adversely affect the surrounding environment (there are concerns for downstream agricultural users of the shallow/surface water regime, and for the deeper-aquifer which supplies potable water to a number of nearby properties). The purpose of the groundwater monitoring program is to evaluate the potential impact of OCL activities on the groundwater and surface water quality; regular monitoring allows for the analysis of trends over time and ensures there is an early warning of potential problems.

Previous assessments of groundwater quality at the Site have identified pre-existing groundwater quality as an obstacle to developing a functional TLP for groundwater in the current Site context. Historical backfill material used on Site, as well as historical and surrounding land uses have resulted in highly variable groundwater quality. For this reason, typical assessments using generic water quality standards as the basis for assessing compliance at the Site boundary do not provide meaningful indications of the effects of Facility operations on groundwater quality.

Condition 9(3b) of the ECA requires the development of criteria in accordance with MOE Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). CRA initially completed an assessment of on-Site water quality in accordance with the Reasonable Use Concept in a memo to Tracy Hart of the MOE dated February 5, 2010. Assessments of water quality provided in Annual Monitoring Reports following submission of the February 5, 2010 memo concluded that the application of the Reasonable Use Concept at the downgradient property boundary is irrelevant due to the presence of numerous parameters elevated above generic standards in background water quality. As such, the Site-specific criteria calculated using the Reasonable Use Concept are not considered appropriate for evaluating Site compliance.

A groundwater trigger level assessment that used intra-well baseline data was provided in the 2012 Annual Monitoring Report for the Site. This type of assessment can be useful for identifying potential increases in groundwater quality impacts by comparing current data to statistically-based upper tolerance limits (UTLs) developed from historical data at individual wells. However, the use of trigger levels based on intra-well baseline UTLs is not considered appropriate for the Site for the following reasons:

1. There is insufficient pre-start-up data to provide statistically valid intra-well baseline data.
2. The intra-well baseline method does not account for the movement of pre-start-up water quality impacts from one portion of the Site to another. Based on the highly variable water quality on-Site prior to start-up of Facility operations, this could yield false triggers in downgradient on-Site monitoring wells.

3.0 Recommended Compliance and Trigger Level Program

For the purposes of assessing potential groundwater quality impairments related to the activities approved under the ECA, comparison of post-start-up data to pre-start-up data provides a useful comparison. Water quality data from pre-start-up monitoring demonstrated considerable variability within the shallow unconfined aquifer across the Site. This pattern is consistent with variable pre-existing sources of water

quality impacts upgradient and/or on-Site. Some sources of water quality impacts un-related to the Facility operations include: current and historical quarrying operations located upgradient of the Site, historical backfill materials used for grading at the Site, and various other current and historical industrial and agricultural activities in the vicinity.

Therefore, in consideration of the variable water quality pre-existing Facility operations, it is recommended that the aggregate Site-wide pre-start-up water quality data be used as the basis for establishing groundwater trigger levels for the shallow unconfined aquifer. The pre-start-up data is all data collected from shallow unconfined aquifer monitoring wells between July 2008 and January 2010. By using an appropriate statistical representation of the overall pre-existing water quality, the trigger levels will provide indications of new water quality impairments, not related to historical activities. This method will reduce the potential for trigger levels being exceeded at specific on-Site monitoring locations due to the migration of pre-existing water quality impairments within the Site boundaries.

It is recommended that the groundwater trigger level program focus on a reduced set of parameters that reflect the sources of potential impact from on-Site activities. These parameters will thus act as surrogates for Site-related water quality impacts. Based on a review of water quality data for the Site and the known sources of impact associated with organic waste processing, the trigger level program should include the following trigger parameters: ammonia, phosphorus, dissolved organic carbon, nitrate, iron, manganese, alkalinity and E. coli.

Ammonia, phosphorus, dissolved organic carbon; nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants to the subsurface.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Shallow Unconfined Aquifer

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the shallow unconfined aquifer. The trigger levels are based on the 95% UTLs for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	4.0 mg/L
Phosphorus	7.2 mg/L
Dissolved Organic Carbon	34.6 mg/L
Nitrate	1.3 mg/L
Iron	48.3 mg/L
Manganese	17.1 mg/L
Alkalinity	633 mg/L
E. coli	25.6 CFU/100mL

Deep Bedrock Unit

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the bedrock aquifer. As an alternative, 95% UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations.

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the bedrock aquifer. The trigger levels are based on the 95% (UTL) for upgradient (TW-7) groundwater data in the bedrock aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	0.2 mg/L
Phosphorus	0.5 mg/L
Dissolved Organic Carbon	18.4 mg/L
Nitrate	0.5 mg/L
Iron	10.6 mg/L
Manganese	2.1 mg/L
Alkalinity	996 mg/L
E. coli	5.0 CFU/100mL

A pumping test completed in 2008 within the deep bedrock unit as part of the Phase II ESA confirmed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. For this reason, any exceedances of the above-referenced trigger levels for the deep bedrock unit should be reviewed in conjunction with other monitoring data to assess whether or not the exceedances are related to Facility operations. It is unlikely that Facility operations will affect deep bedrock unit water quality.

Trigger level program - Tiers

The TLP should be implemented using a series of three Tiers to verify the results and direct potential contingency implementation. The following paragraphs describe the three Tiers recommended to be included as part of the TLP.

Tier I – Routine Monitoring and Trigger Locations

Tier I monitoring involves the sampling of all on-Site groundwater monitoring wells at the frequency prescribed in the Site environmental monitoring program. All groundwater monitoring activities completed at the Site will be considered Tier I monitoring unless two or more trigger parameters exceed their respective trigger levels in a single sample.

Groundwater monitoring will be conducted at the Site, as follows:

- Tri-annually (three times per year) at MW101-13, MW102-09, MW104-13, MW105-09, MW5-09, MW106-15*
- Semi-annually (twice per year) at all remaining overburden and bedrock monitoring wells, respectively MW1-08, MW2-08, MW3-08, MW4-09, and MW103-09

*-Not yet installed

Tier II – Confirmation Monitoring

If during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring program will be implemented. The Tier II Confirmation Monitoring program consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next scheduled monitoring event in order to confirm the Tier I exceedance of the two or more trigger parameters. If the concentrations reported in the duplicate samples return to below their respective trigger levels, then Tier I monitoring will resume.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

The comparison of the observed water quality to generic criteria, the applicable regulatory compliance framework, the pre-existing water quality, and downgradient use of groundwater will dictate the timing and urgency of response. The comparison should also include parameter trend analyses over time and the contributions of sources of impact other than the Facility. If the Tier II Confirmation Monitoring program and subsequent evaluation indicate that Facility operations are having a detrimental effect on water quality migrating off-Site, then Tier III - Contingency Measures will be implemented.

Tier III – Contingency Measures and Compliance Monitoring

The Tier III portion of the TLP involves assessment and implementation of contingency measures in the event of imminent off-Site groundwater quality impairment. Contingency measures to be evaluated would include extraction of impacted groundwater and/or surface water for on-Site treatment or off-Site disposal, or acquisition of groundwater rights and registration of a contaminant attenuation zone on title of adjacent lands.

Tier III also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented. The Tier III compliance monitoring program details would be determined in conjunction with the development and implementation of preferred contingency measure(s). The compliance monitoring parameters, locations and monitoring frequency would be determined at the time of implementation of contingency measures.

Appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed. As the nature of potential future water quality issues cannot be known in advance, it is not practical to develop remediation plans that will necessarily best suit the particular situation in the event of water quality impairment.

4.0 Closing

It is recognized that using pre-existing water quality data as the basis for the groundwater trigger level program will not necessarily provide an effective measure of the potential for off-Site migration of adverse water quality, as it relates to adjacent water uses. For this reason, it is necessary that evaluations of water quality included within the Annual Monitoring Reports take into consideration the potential for impairment of downgradient water quality uses, regardless of the nature of the source of the impact (off-Site sources, Facility operations, historical impacts, etc.).

As such, evaluations of the shallow unconfined aquifer should compare water quality adjacent to surface water courses to the Provincial Water Quality Objectives (PWQOs) to assess the potential effects of shallow groundwater discharging to surface. Evaluations of deep bedrock groundwater should compare water quality to the Ontario Drinking Water Quality Standards (ODWQSs).

MEMORANDUM

January 3, 2017

TO: Kyle Straberger
Senior Environmental Officer
Peterborough District Office
Eastern Region

MINISTRY OF THE ENVIRONMENT
JAN 11 2017
OTTAWA

FROM: Bob Holland
Hydrogeologist
Water Resources Unit
Technical Support Section
Eastern Region

RE: Orgaworld Organics Facility
2015 Groundwater and Surface Water Monitoring Report
Trigger Level Program
5123 Hawthorne Road
City of Ottawa
Hydrogeologic Assessment

I have reviewed the above noted report signed by Conestoga Rovers & Associates March 31, 2016 describing groundwater impacts related to the Orgaworld Organics Facility in Ottawa. The report also provides the Trigger Level Program (TLP) to protect groundwater from the impact of this new facility.

The consultant provides an assessment of the physical hydrogeology of the site. A shallow aquifer exists at the bedrock overburden interface. Water level monitoring has confirmed the inferred groundwater flow direction in the upper unconfined aquifer is to the east with some level of limited discharge to ditches located along the north site boundary. The Surface Water Unit should review this report as groundwater that does not meet Provincial Water Quality Objectives for ammonia may at times discharge to these ditches.

A deep aquifer exists in sandstone. Based on in-situ hydraulic testing the consultant has deemed there is no hydraulic connection between the deep aquifer and the unconfined shallow aquifer. Inferred groundwater flow in the deep aquifer is to the west. Contaminants of concerns identified are ammonia, iron, manganese, dissolved organic carbon, sulfate, and total dissolved solids. Groundwater quality mapping of ammonia, DOC, iron and manganese confirm that a plume extends in the shallow aquifer northeastward, originating in and around the northeast corner of the Organic Composting Facility. Some impacts have been detected in the deep aquifer.

A TLP has been proposed recognizing that past site activities and up gradient water quality issues exist and that an alternative method has been developed to assess the net impact of this new facility, bearing in mind that groundwater impairment must not occur. I have reviewed the proposed TLP and find it is acceptable to me.

I find the monitoring program rationalization acceptable to me.

In general, I agree with the conclusion and recommendations made by the consultant. Current remediation efforts must continue to improve groundwater quality at all down gradient monitoring wells relative to facility start up and any additional work as per the TLP. If a Tier III trigger is reached I should be consulted.

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/27	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Proposed Monitoring Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline the proposed groundwater and surface water monitoring programs for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Site) located at 5123 Hawthorne Road, Ottawa, Ontario. This memorandum has been prepared in support of an application to amend ECA No. 9465-7NVRWT (Industrial Sewage Works). The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

1.1 Current Monitoring Program

The current monitoring program for the Site is defined in the above-referenced ECA and includes hydraulic monitoring and sampling at 11 groundwater monitoring well locations within the shallow unconfined aquifer and 3 groundwater monitoring wells in the deep bedrock aquifer unit. The monitoring program also includes sampling at 4 surface water locations. The following locations are currently sampled on a semi-annual basis (twice per year):

Unconfined Shallow Aquifer	*Deep Bedrock Aquifer*	*Surface Water*
MW1-08	TW-4	SW-1
MW2-08	TW-7	SW-2
MW3-08	TW-8	SW-3
MW4-08		SW-4
MW4-09		

ISO 9001

The following locations are sampled on a quarterly basis.

Unconfined Shallow Aquifer
MW5-09
MW101-13
MW102-09
MW103-09
MW104-13
MW105-13

The current analytical parameter list for the Site, as per the Site's Environmental Compliance Approval (ECA No. 7251-8GKRPD, as amended) consists of selected general chemistry, bacteriologic components, metals, petroleum hydrocarbons (PHCs), and polycyclic aromatic hydrocarbons (PAHs).

A complete summary of the current monitoring program is provided in Table 1.

2.0 Proposed Monitoring Program

Based on the results of monitoring completed to date, there is sufficient data collected to warrant reductions in the monitoring program. The reductions in monitoring include changes in monitoring frequency at selected locations and removal of several analytical parameters from the list of analytes. The following sections discuss the proposed changes to the monitoring program.

2.1 Monitoring Frequency

A significant amount of monitoring data has been collected to date for the on-Site monitoring wells. The monitoring data has allowed for a comprehensive understanding of the spatial and temporal patterns in groundwater quality. As groundwater quality is generally well understood, it is recommended that monitoring frequency be reduced at selected locations.

During recent monitoring years, field staff has been unable to complete the winter monitoring event during February due to frozen monitoring wells. For this reason, it is recommended that the winter (February) monitoring event be removed from the monitoring program. Three monitoring events (spring, summer, and fall) should be maintained per year at locations where detailed groundwater monitoring is suitable.

The following table summarizes the recommended groundwater monitoring frequency.

Location	*Current Sampling Frequency*	*Proposed Sampling Frequency*	*Unit*	*Trigger Well*
MW101-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW102-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW103-09	Quarterly	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW1-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW2-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW3-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW4-09	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW5-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW104-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW105-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW106-15	NA	Tri-Annual	Unconfined Shallow Aquifer	Yes
EW107*	NA	Tri-Annual	Unconfined Shallow Aquifer	No
TW-4	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-7	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-8	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No

*- Not yet installed
+ - Upgradient well
NA – Not applicable

As indicated in the above table, the recommended changes to the monitoring program include:

- Reduction of monitoring from quarterly to tri-annual (three times per year) at selected locations
- Reduction of monitoring from quarterly to semi-annual at MW103-09. This location is located away from verified sources of impact and semi-annual monitoring will provide adequate water quality data at this location.

It should be noted that the monitoring frequency specified above is consistent with the monitoring frequency proposed in the updated TLP.

Groundwater monitoring well (MW106) and extraction well (EW107) have not yet been installed, but are scheduled for installation prior to the spring 2015 monitoring event. These wells should be incorporated into the monitoring program at the monitoring frequency specified above, following installation.

Surface water sampling is currently conducted at two upstream locations: SW1-09 and SW2-09. The analytical results have generally been consistent between these two locations. As there are no Site-related sources of impact between SW-1 and SW-2, it is recommended that sampling at SW-1 be discontinued. As such, surface water quality monitoring should continue semi-annually at locations SW2-09 and SW3-09. SW4-09 should continue to be sampled on a monthly basis (when weather conditions permit safe sampling at this location).

2.2 Monitoring Parameters

The existing monitoring program includes sampling of groundwater and surface water for PHC and PAH parameters. The results of PHC and PAH analyses have demonstrated largely non-detect results for the majority of these parameter lists. The sporadic detections of PHCs or PAH parameters have been inconsistent and at very low concentrations often just above the detection limits. In addition, similar infrequent low-level detections have also been reported at background monitoring locations. Therefore, it is likely that any detection of PHCs or PAHs parameters are the result of background conditions and/or related to fill materials historically used in the vicinity of the Site. Thus, PHCs and PAHs are not considered useful in evaluating groundwater and surface water for potential environmental impacts related to Site operations.

It is recommended that PHCs and PAHs be removed from the current monitoring parameter list.

The recommended monitoring program for the Site is summarized in Table 2.

Notes:

[1] General chemistry parameters - colour, alkalinity, ammonia, BOD, COD, chloride, colour, DOC, nitrate, nitrite, pH, phenols, phosphorus, sulphate, TDS, TKN, TSS turbidity, and un-ionized ammonia

[2] Additional Surface Water General Chemistry parameters analyzed at SW-4 - conductivity, oil and grease (mineral/HEM/animal and vegetable)

[3] Metals - arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, and zinc

[4] Surface water metals are total while groundwater metals are dissolved.

[5] PAHs - polycyclic aromatic hydrocarbons - anthracene, benzo(a)pyrene

[6] Escherichia coli (e.coli), fecal coliform bacteria, total coliform bacteria

[7] SW4-09 is sampled by CRA field staff on a bi-annual basis and monthly by Orgaworld staff (when it's safe to do so)

[8] Expanded PAHs - collected once per year at downgradient locations. Includes:
1-methylnaphthatlene, 2-methylnapthalene, acenaphthene, acenaphthylene, acridine, benzo(a)anthracene, Benzo(b)fluoranthene
benzo(b)pyridine (quinoline), benzo(g,h,i)perylene, benzo(k)fluoranthene, carcinogenic potency equivalent, chrysene, dibenz(a,h)anthracene
fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene,and pyrene

X Samples collected quarterly (winter, spring, summer, and fall)
√ Samples to be collected semi-annually (spring and fall)
o Samples are collected annually (typically spring)

MEMORANDUM

TO:	Ministry of the Environment	REF. NO.:	045804-22
FROM:	Ben Kempel/Ben Constable/mg/25	DATE:	July 16, 2014
CC:	Tej Gidda, Ron Cherkewski, Mike Rooke		
RE:	**Groundwater Assessment and Work Plan - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates (CRA) has prepared this memorandum on behalf of Orgaworld Canada Ltd. (Orgaworld) to provide the Ministry of Environment (MOE) with the results of supplementary data assessment completed on groundwater monitoring data for the Orgaworld organic waste processing facility (Facility) located at 5123 Hawthorne Road, Ottawa, Ontario (Site). The assessment has been undertaken in response to identified increases in ammonia concentrations within shallow groundwater downgradient of the Facility. The assessment has focused on monitoring data for the most recent (2013) monitoring period and included the following activities:

- 2013 Data Assessment – Ammonia (Section 2.0)
- Additional Parameters of Concern (Section 3.0)
- Groundwater Discharge to Surface (Section 4.0)
- Data Gap Analysis (Section 5.0)

CRA has prepared a work plan for further investigating and characterizing groundwater at the Site. The purpose of the additional investigation is to refine the ammonia plume delineation, improve understanding of the aquifer properties on-Site, and determine the potential receptors associated with the plume.

Orgaworld currently operates under the following Environmental Compliance Approvals (ECA's) for the Site:

- Number 7021-7HQNDE (Air), September 16, 2009
- Number 9465-7NVRWT (Industrial Sewage Works), September 16, 2009
- Number 7032-88XPRA (Industrial Sewage Works), Amended September 7, 2010
- Number 7251-8GKRPD (Industrial Sewage Works), Amended May 30, 2011
- Number 2766-7HEPSZ (Waste Disposal Site), September 16, 2009, Amended under Notice No. 1, October 21, 2010

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

Condition 9 (8) of ECA Number 7251-8GKRPD requires that Orgaworld establish a comprehensive Compliance and Trigger Level Monitoring Program based on groundwater monitoring within two years of operations. The Compliance and Trigger Level Monitoring Program is to be submitted to the MOE along with an application to amend the ECA. Orgaworld has not applied to amend the ECA, as the monitoring data gathered since 2010 to define baseline conditions for the site has been influenced by both existing conditions at the Site, largely comprised of historical fill materials and adjacent to quarrying activities, and potentially the Facility's operations. This work plan has been specifically designed to present results and interpretation of the historical and current data and to define steps moving ahead to address groundwater quality.

The following sections discuss the results of the assessment and describe the proposed work plan.

2.0 2013 Data Assessment - Ammonia

Interpretations of pre-2013 analytical data identified the existence of an ammonia plume within shallow groundwater originating near the eastern side of the organics composting facility and migrating to the northeast towards the Site boundary. Elevated concentrations of ammonia were originally reported in historic monitoring well MW101-09 in May 2010. Elevated ammonia concentrations were detected in monitoring wells located downgradient of MW101-09 during subsequent monitoring events. Ammonia concentrations were observed to increase within the interpreted source area (MW101-09) and downgradient Site boundary monitoring wells (MW5-09, MW102-09) through 2012. Based on a review of 2013 data, elevated ammonia concentrations are persistent within the source area and concentrations continued to increase through 2013 at the downgradient monitoring wells. The Site groundwater monitoring network is illustrated on the attached Site Plan (Figure 1).

Monitoring well MW101-09 was abandoned during 2012 due to suspicions that the well integrity may have been compromised. In addition, several new monitoring wells were installed near the interpreted source area in early 2013. The analytical results from the initial year of sampling at MW101-13 and MW104-13 confirm that elevated concentrations of ammonia exist immediately downgradient of former historic monitoring well MW101-09. The analytical results from MW105-13 show that the elevated concentrations of ammonia are also present to the northeast of MW101-09.

Figures 2 through 7 illustrate ammonia concentrations versus time for the monitoring wells within the source area and downgradient along the Site boundary. As depicted in the Figures, ammonia concentrations have demonstrated increasing trends at monitoring wells MW104-13, MW5-09, MW102-09, and MW101-13.

3.0 Additional Parameters of Concern

A comparison of the 2012 through 2013 analytical data for downgradient monitoring wells (MW5-09, MW102-09, MW1-08) located along the northern Property boundary to the Ontario Drinking Water Standards (ODWS) and upgradient water quality at MW3-08 was completed to identify additional parameters of potential environmental concern within shallow groundwater. Based on this comparison,

several general chemistry and metals parameters have been reported at concentrations above their respective ODWS criteria, and significantly elevated above upgradient levels. The following additional parameters have been identified as potential parameters of concern. The maximum reported downgradient, Site boundary concentrations and respective ODWS criteria (in brackets) are as follows:

- Iron – 7.5 mg/L (0.3 mg/L)
- Manganese – 4.8 mg/L (0.05 mg/L)
- Dissolved Organic Carbon – 12.1 mg/L (10 mg/L)
- Sulfate – 872 mg/L (200 mg/L)
- Total Dissolved Solids – 2030 mg/L (500 mg/L)

It should be noted that, similar to the trend noted for ammonia, the concentrations of the above parameters have generally demonstrated increasing trends during recent years at monitoring wells immediately downgradient of the Facility.

Figures 8 through 11 provide concentration isopleths for ammonia, dissolved organic carbon (DOC), dissolved iron, and dissolved manganese based on the median sample results from 2013 monitoring in monitoring wells completed within the shallow aquifer. Each figure illustrates the presence of elevated concentrations in the interpreted source area and downgradient towards the northern Site boundary. Elevated concentrations of iron, manganese, DOC and TDS are consistent with the interpretation that the contaminant plume is related to an organic contaminant source. As indicated on these figures, there is little known about the western extent of the plume near the northern Site boundary. The proposed work plan for addressing this data gap is discussed in Section 5.3.

4.0 Groundwater Discharge to Surface

The presence of elevated ammonia concentrations within shallow groundwater is primarily a potential concern with respect to the discharge of shallow groundwater to surface water, due to the relatively low Provincial Water Quality Objective (PWQO) for un-ionized ammonia (0.02 mg/L). As such, it is recommended that the hydraulic relationship between shallow groundwater and surface water be investigated through the installation of staff gauges and measurement of static water levels in both shallow groundwater and surface water. The work plan for addressing this investigation is discussed in Section 5.3.

5.0 Data Gap-Analysis

There is sufficient evidence to confirm that a plume exists on-Site within the shallow groundwater adjacent to and downgradient of the Facility. The available groundwater quality data suggests that the plume consists of organics-related contaminants with elevated concentrations of ammonia. As part of the data assessment, CRA completed a data-gap analysis to identify areas where important information is unavailable concerning the contaminant nature, distribution or fate.

The following sections discuss the identified data gaps and outline the proposed action items for addressing the data gaps. Completing these action items forms the basis of the proposed work plan.

5.1 Surface Water Levels

As discussed previously, elevated ammonia concentrations within groundwater can be an issue of environmental concern when groundwater discharges to surface water, as the PWQO for un-ionized ammonia is low (0.02 mg/L). As such, it is important to understand whether or not shallow groundwater discharges to surface water at the Site to determine if the elevated ammonia concentrations are entering the surface water regime.

The comparison of shallow groundwater elevations with adjacent/nearby surface water elevations during quarterly monitoring events will determine whether or not groundwater is discharging to surface. As such, a series of staff gauges will be installed within the ditch along the north side of the Site (and any other on-Site surface water features, as appropriate). These staff gauges will be surveyed for geodetic reference. Surface water elevation measurements will then be incorporated into the monitoring program during each monitoring event. These measurements will be completed for a minimum of one year in order to observe the shallow groundwater - surface water relationship in different seasons.

Recommendations concerning the potential continuation of monitoring in the ditch will be made following one year of monitoring.

5.2 Complete Topographic Site Survey

It is understood that an as-built topographical survey of the site is unavailable. Accurate comparison of ground water levels to site grades is needed to verify if groundwater is discharging to the Site's surface water bodies. As such, an up to date topographical survey will be completed so this interface can be accurately assessed. The topographic survey will also be used to verify the pond levels and the outflow levels from the site into the Hawthorne Industrial Park.

5.3 Additional Monitoring Data

Groundwater

Although the current monitoring network has adequately identified the presence of an ammonia plume, the western extent of the contaminant plume along the northern Site boundary is currently unknown. Therefore, a shallow groundwater monitoring well will be installed to the west of MW5-09, as indicated on Figure 1 to better define the western extent of the plume. The proposed monitoring well will be incorporated into the regular monitoring program for quarterly sampling until sufficient data is gathered to warrant a monitoring reduction.

Surface Water

As discussed in Section 5.1, four (4) surface water staff gauges will be installed within the ditch along the north end of the Site in order to measure water levels within the ditch. The staff gauges will be geodetically surveyed so that measured water levels can be converted into static elevations. These static

elevations will be compared to the static groundwater elevations in adjacent groundwater monitoring wells to determine if shallow groundwater is discharging to this ditch. The proposed surface water staff gauge locations are illustrated on Figure 1.

5.4 Hydraulic Testing

In order to have a thorough understanding of the hydraulic characteristics of the shallow overburden and bedrock aquifers, additional testing of the aquifer properties will be completed along the northern Site boundary. This testing will be accomplished through single well response tests on the existing and proposed shallow groundwater monitoring wells in this area (MW5-09, MW102-09 and the proposed monitoring well).

The results of this testing will be used to better estimate the aquifer properties along the northern Site boundary.

6.0 Groundwater Remediation

In response to the identified groundwater plume, a single shallow groundwater extraction well will be installed near the ammonia scrubber. Based on the nature of the contaminants observed, the contaminant distribution and the interpreted source of leakage, the area immediately downgradient of the ammonia scrubber is considered the most suitable location for a remediation/extraction well.

The purpose of the extraction well will be to remove the most heavily impacted groundwater from the subsurface for use in the Facility process. Up to 15,000 L of groundwater can be used in the process daily. As such, this source removal strategy represents an ideal opportunity to control a significant portion of the plume without the need for treatment or trucking to a disposal facility.

7.0 Closing

It is anticipated that the installation of an additional monitoring well, a remediation/extraction well and establishment of surface water staff gauges will occur during the summer of 2014. The monitoring points will be incorporated into the regular monitoring program during the next regularly scheduled monitoring event.

The results of the above-described work program, including recommendations for next steps, will be provided to the MOE in a letter report following completion of the assessment.

We trust this to be complete and in order for your use. Should you have any questions, please do not hesitate to contact our office.

Table E.4.2

Unconfined Shallow Groundwater Analytical Results
2017 Groundwater and Surface Water Monitoring Report
Orgaworld Canada Ltd.
Ottawa, Ontario

Notes:

1) TLP - Trigger Level Program Concentration (CRA, 2015)
J - Estimated concentration.
ND - Non-detect at associated value.
U - Not present at or above the associated value.
R - Rejected.
- - Not analyzed.
▭ - Exceedence of the Tier I Trigger Level

Table E.4.3

Deep Bedrock Groundwater Analytical Results
2017 Groundwater and Surface Water Monitoring Report
Orgaworld Canada Ltd.
Ottawa, Ontario

Notes:

1) TLP - Trigger Level Program Concentration (CRA, 2015)
2) ODWQS - Ontario Drinking Water Quality Standards, Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines (MOECC, June 2003, revised June 2006)
J - Estimated concentration.
ND - Non-detect at associated value.
U - Not present at or above the associated value.
R - Rejected.
- - Not analyzed.
[ ] - Exceedence of the Tier I Trigger Level
[ ] - Exceedence of the ODWQS

Kyle Straberger
Senior Environmental Officer
Ministry of the Environment and Climate Change
2430 Don Reid Drive
Ottawa, Ontario
K1H 1E1

Dear Mr. Straberger,

Orgaworld operates a Stormwater Management Pond (SWM Pond) at our facility in Ottawa. The SWM Pond is approved under ECA Number 2844-9YNGZC (the ECA). The ECA defines various operational procedures related to the SMP. Condition 5(11) specifies that the Owner shall maintain the water level in the detention pond at a level that ensures adequate storage is available for Stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of [i.e. discharged] in a timely manner to minimize the occurrence of emergency overflow during major storm events. Condition 5(5) describes the sampling that is to be completed within the SWM Pond prior to the discharge of any stormwater from the pond. This Condition defines parameters and trigger levels against which sample results are to be compared prior to any discharge.

Orgaworld personnel sampled the SWM Pond on April 9, 2018 and the analytical results for the collected sample demonstrated water quality that was below all trigger levels defined in Table 2 (Trigger Parameters) of Condition 5(5) the ECA. Orgaworld opened the manually-operated sluice gate wide enough (i.e. 1-2 inches) to allow for a steady stream of effluent, and discharged the SWM Pond for a period of 12 days.

Based on the sampling conducted and the analytical results for the SWM Pond sample, it is Orgaworld's position that the Conditions of the ECA were met prior to discharge.

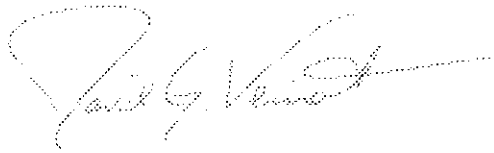
Eleven days after the discharge period concluded, Orgaworld's landlord, Tomlinson, notified Orgaworld that they had a sample collected from the pond's outlet pipe during the discharge interval, and that the analytical result for unionized ammonia and E.coli in the sample exceeded their respective PWQOs and ECA Trigger Levels. Orgaworld understands from Tomlinson that the sample was collected by staff from Golder & Associates. A copy of the chain of custody, site plan, field notes, sampling methodology, and an analytical certificate reportedly for the SWM Pond outlet sample were later provided to Orgaworld upon request. No report summarizing the sampling exercise from Golder & Associates was provided to Orgaworld, nor do we know if such a document exists. Based on the information provided to Orgaworld, the SWM Pond sample collected by Golder staff contained an unionized ammonia concentration of 0.066 mg/L and an E.coli reading of 122 CFU/100 ml. These concentrations exceeds the trigger levels for unionized ammonia defined in the ECA (0.05 mg/L) and E.coli (100 CFU/100 ml). Tomlinson's sampling activity came as a surprise to Orgaworld.

Orgaworld's environmental consultant, GHD Ltd., reviewed the information provided by Tomlinson and Golder, and verified that the sampling carried out by Golder was not consistent with the sampling requirements prescribed in the ECA. There is no requirement for grab sampling of pond effluent during the actual discharge period, or for samples to be taken from the pond's concrete headwall outlet pipe.

Tomlinson's motivation for conducting the sampling exercise is unknown as the discharged storm water is not thought to impact any of their property holdings in the area.

The difference between the unionized ammonia concentration reported in the pre-discharge sample collected by Orgaworld on April 9th, and the concentration reported in the Golder sample taken on April 19th, may be attributable to the expected natural variability within surface water quality of a large Stormwater retention pond and/or the higher field temperature (Δ 5.6°C) reported by Golder at the time of sampling. The calculation to derive the unionized fraction of ammonia is extremely sensitive to the temperature of the water sample – a higher field temperature will result in a higher unionized fraction. The difference in E.coli could be attributed to variability in the retention pond resulting from the presence of numerous water fowl during the late winter/early spring.

As GHD was not involved in either sampling activity, they cannot comment on the details of the respective sampling methodologies or the validity of the data obtained by the two parties. GHD did comment to Orgaworld that the ECA is clear on the pre-discharge sampling requirement, and the obligation to compare Stormwater samples to the Trigger Parameters in Table 2 prior to discharge. Based on the evidence presented, it appears to GHD that Orgaworld satisfied the intent of these requirements.

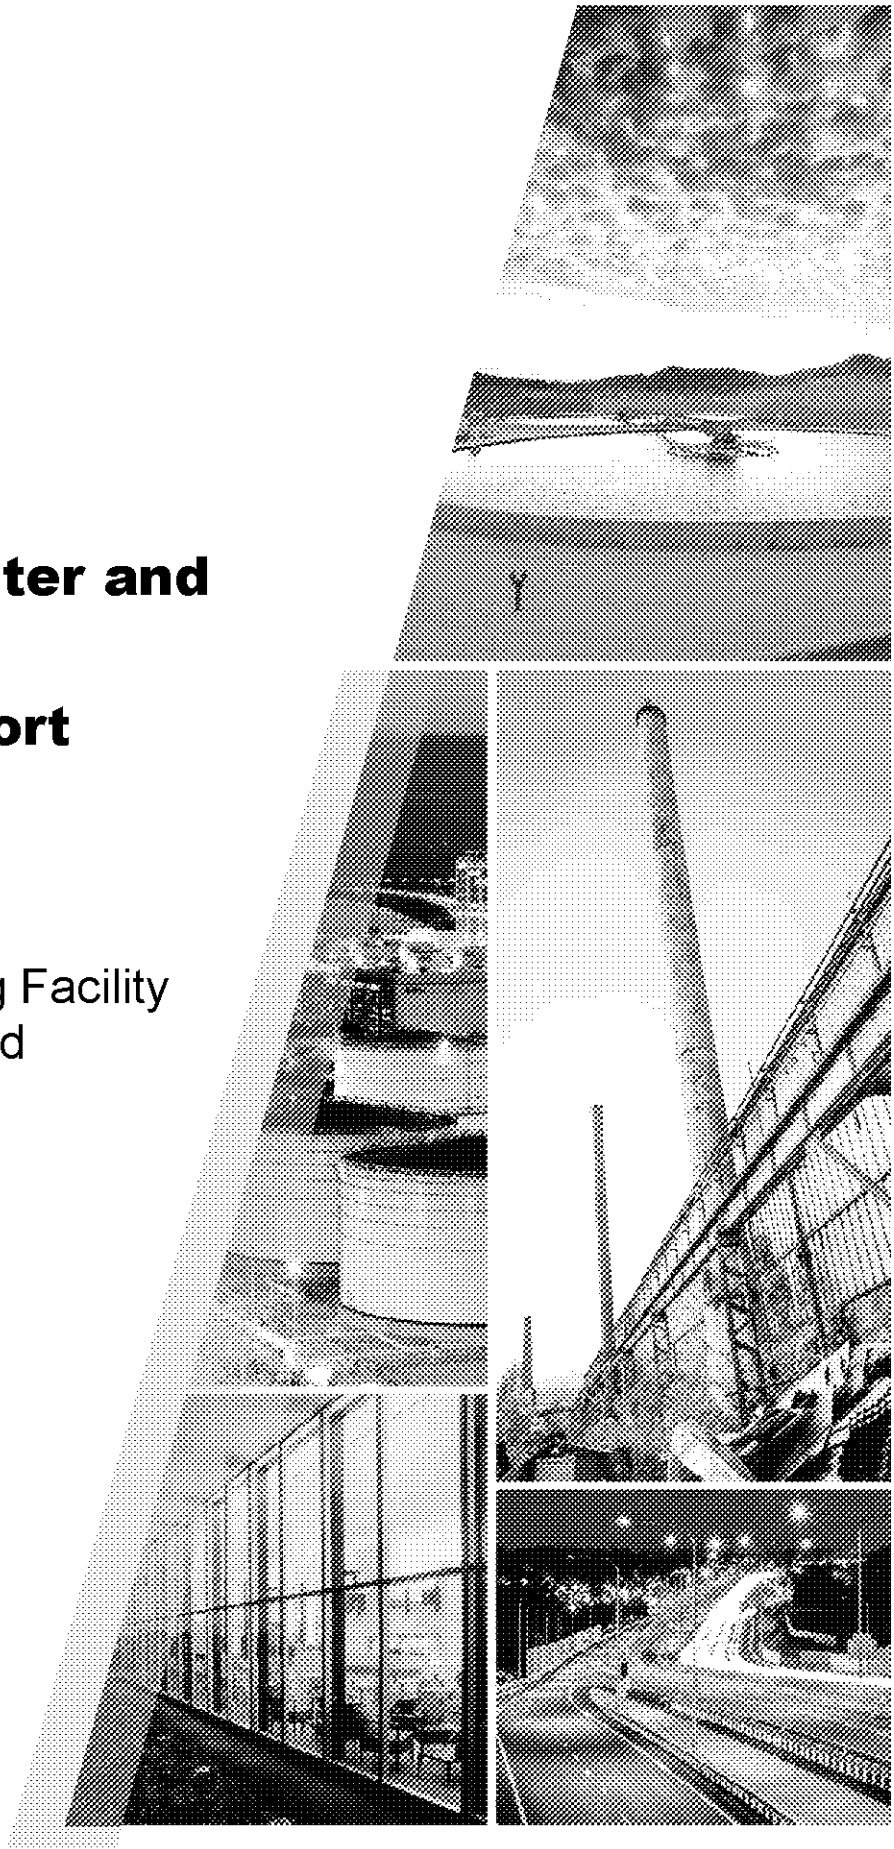


Orgaworld is unsure of the relevance of the sampling results reported by Tomlinson. It is Orgaworld's understanding that the Conditions of the ECA have been met. No additional sampling or reporting of data is required, based on the Conditions of the ECA. Therefore, Orgaworld has decided not to report a violation of the Site's ECA to the MOECC based on the sampling performed by Golder on behalf of Tomlinson.

Orgaworld is committed to complying with the Conditions of the ECA in a responsible manner and will continue to properly characterize SWM Pond water quality prior to discharge. Accordingly, Orgaworld will not discharge from the pond until sample results confirm that water quality within the SWM Pond meets the trigger levels defined in Condition 5(5) of the ECA.

In the event that future sampling results indicate an exceedance of a trigger level in a SWM Pond sample collected during discharge, Orgaworld will implement the "Spill Contingency and Pollution Prevention Plan", as required by Condition 5(6) of the ECA.

We trust that this review has satisfied the request you made in your email of May 8, 2018. If you have any further comments or questions, please feel free to contact me at your convenience.



Best regards,

David Veinot
Compliance Officer

2018 Groundwater and Surface Water Monitoring Report

Renewi Canada Ltd.
Organics Composting Facility
5123 Hawthorne Road
Ottawa, Ontario

002580

Executive Summary

GHD was retained by Renewi Canada Ltd. (formerly Orgaworld Canada Ltd.) to conduct a Groundwater and Surface Water Monitoring Program (Monitoring Program) at the Renewi Source Separated Organics (SSO) Processing Facility (Facility) located at 5123 Hawthorne Road in Ottawa, Ontario (Site).

The 2018 Monitoring Program was completed in general accordance with the requirements of the Facility's Industrial Sewage Works Environmental Compliance Approval (No. 2844-9YNGZC) as amended on February 1, 2017.

The purpose of the Monitoring Program is, in accordance with the ECA, to assess the potential for Site activities to adversely affect the surrounding surface water and groundwater quality.

GHD completed three monitoring events at the Site in May, August, and November 2018 that included groundwater elevation measurements, groundwater quality sampling, and surface water sampling. Based on the groundwater elevations gathered in May and November 2018, shallow unconfined aquifer flow occurs in an east-northeast direction and groundwater in the deep bedrock aquifer flows in a west-southwest direction, opposite to the direction of the shallow unconfined aquifer.

Analytical results for the shallow unconfined aquifer samples indicate that groundwater quality at the Site is being altered by Facility operations. The distribution of elevated concentrations of ammonia, DOC, iron, and manganese are consistent with a contaminant plume related to an organic contaminant source.

Analytical sample results obtained from the deep bedrock aquifer unit monitoring wells indicate that groundwater quality in the deep bedrock aquifer is naturally poor. Increasing ammonia concentrations during previous monitoring periods had been observed downgradient of the Facility at TW-8, however recent results show decreases in ammonia concentrations.

The 2018 groundwater quality results were assessed using the Site's Trigger Level Program. Within the shallow unconfined aquifer, ammonia was found at concentrations greater than those specified by the Site's trigger concentrations at several of the near Facility monitoring wells as well as some downgradient monitoring locations.

Multiple Tier I trigger level exceedances in a single sample were found at four shallow unconfined aquifer locations in 2018. Trigger level exceedances at MW102-09 (in August) and MW105-13 (in May) did not persist during subsequent sampling events, as such, both wells will be sampled as part of the Tier I program in 2019. The trigger level exceedances at MW101-13 and MW104-13 occurred in the November 2018 samples. These locations will be sampled under Tier II conditions during the Spring 2019 monitoring event.

The only trigger level exceedances from a deep bedrock aquifer location in 2018 occurred in the November 2018 sample from TW-4 with elevated ammonia and E.coli concentrations. This location will be sampled under Tier II conditions during the Spring 2019 monitoring event. This location was sampled under Tier II in May 2018 due to trigger level exceedances in November 2017. Trigger level exceedances were not observed in the May 2018 sample and as such the well was returned to Tier I monitoring for November.

Surface water sample results indicate that surface water quality downstream of the Site was unaltered by Site activities during the 2018 monitoring period.

Surface water was discharged twice from the on-Site Stormwater Management Pond during the 2018 monitoring period (April and June). All parameters were below their respective trigger levels listed in the Site ECA in samples collected from the Stormwater Management Pond prior to discharging.

1. Introduction

GHD was retained by Renewi Canada Ltd. (formerly Orgaworld Canada Ltd.) to conduct a Groundwater and Surface Water Monitoring Program (Monitoring Program) at the Renewi Source Separated Organics (SSO) Processing Facility (Facility) located at 5123 Hawthorne Road in Ottawa, Ontario (Site).

A Site location map is provided on Figure 1.1.

The 2018 Monitoring Program was completed in general accordance with the requirements of the Facility's Industrial Sewage Works Environmental Compliance Approval (No. 2844-9YNGZC) as amended on February 1, 2017 (herein referred to as the ECA). A copy of the Facility's ECA is provided as Appendix A which is included on the USB Drive at the end of this report. Please note that all Appendices are included on the USB Drive.

The purpose of the Monitoring Program is, in accordance with the ECA, to assess the potential for Site activities to adversely affect the surrounding surface water and groundwater quality.

1.1 Site Background

The Site consists of an area of approximately 10-hectares that is located within an industrial development area. The area, known as the Hawthorne Industrial Park, occupies a surface area of approximately 80-hectares (referred to herein as the HIP subdivision) and has been developed by R.W. Tomlinson (Tomlinson) as an industrial business area. Renewi is a tenant of Tomlinson.

Between June and August 2008, GHD conducted Phase I and II Environmental Site Assessment (ESA) investigations for Tomlinson to determine the general suitability of the HIP subdivision lands for development as an industrial park. More specifically, the ESAs were completed to support a Site Plan Control Application for the lease and subsequent development and operation of the SSO facility in the southwest portion of the HIP (CRA, 2008a). GHD submitted the ESAs to the City of Ottawa on behalf of Renewi.

Site clearing and preparation was completed in 2008, Facility was constructed during 2009, and initial receipt of materials for processing was in January of 2010.

The 2008 groundwater monitoring/sampling activities included sampling of ten shallow aquifer wells (MW1-08 to MW10-08) and three surface water locations (SW1 to SW3). In addition, Golder Associates Ltd. (Golder) conducted a pumping test and sampling of the deep groundwater wells in August 2008 (TW-2 and TW-3) and October 2008 (TW-4 to TW-6) (Golder, 2008).

In 2009, GHD was tasked by Renewi to generate the Monitoring Program, based on a request from the Ministry of Environment, Conservation & Parks (MECP) through the process of reviewing the ECA application. In March 2010, the Monitoring Program was modified through an ECA amendment to reflect Site conditions and monitoring well availability. Further modifications to the monitoring program were required in 2013, to reflect additional changes in the monitoring well network (replacement and addition of new monitoring wells).

Condition 9(8) of the former ECA (Industrial Sewage Works No. 7251-8GKRPD) states that:

> *"the Owner shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this Certificate to the Director and the District Manager."*

In order to satisfy this condition, GHD prepared a Compliance and Trigger Level Monitoring Program (TLP) in 2014/2015. The TLP was submitted to the MECP along with an application to amend the ECA in March 2015. The updated TLP uses a focused set of parameters and statistically based upper tolerance limits (UTLs) developed from historical data for the purpose of setting Site-specific trigger levels for the selected parameters. A complete discussion and assessment consistent with the TLP is included in Section 5. For reference, a copy of the memorandum sent to the MECP that outlines the updated TLP is included in Appendix B1.

GHD prepared a Monitoring Program Rationalization (MPR) for the Site during 2015. The purpose of the MPR was to ensure that groundwater and surface water was being adequately monitored. This was accomplished through a review of the monitoring program and removal of any redundant or unnecessary monitoring. The principal recommendations of the MPR are as follows:

- Incorporate the proposed monitoring and extraction wells into the monitoring program upon installation
- Reduce monitoring from quarterly to three times per year
- Remove polycyclic aromatic hydrocarbon and petroleum hydrocarbon monitoring from the program

A copy of GHD's memorandum outlining the MPR is included in Appendix B2.

On February 1, 2017, the MECP issued a revised ECA (No. 2844-9YNGZC) for the facility. The revised ECA incorporates the updated TLP submitted to the MECP in March 2015.

The 2018 monitoring program was completed in accordance to the schedules in the revised ECA. A copy of the revised ECA is included in Appendix A.

This report presents an assessment of the groundwater and surface water quality at the Site and covers the period between January and December 2018.

1.2 Site Setting

The Site is located at the southwest corner of the HIP subdivision lands, located within the former Township of Gloucester (community of South Gloucester), which was amalgamated in January 2001 as part of the City of Ottawa. The HIP subdivision was developed by Tomlinson, and is located southeast of the Hawthorne Road and Rideau Road intersection, in the southeast area of the City of Ottawa.

The layout of the Site, commencing at the western portion of the Site off the Hawthorne Road entrance, consists of a large processing plant with a delivery/receiving area, administrative office, septic bed area, and emission stack. An asphalt skirt extends around three sides of the building, which slopes north, east, and south towards an on-Site perimeter ditch system. The on-Site perimeter ditch system drains to the storm water management (SWM) pond located at the east side of the Site. The layout of the SWM and the drainage ditches are illustrated on Figure 1.2.

Surface water run-off from the Site generally drains to the on-Site perimeter ditch system which, in turn, drains to the on-Site SWM pond where it is impounded for re-use in the Facility process or until it is

manually released off-Site. Water that is released flows through local roadside ditches within the HIP subdivision, which discharge to a central stormwater dry pond for the HIP subdivision, and then to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River.

The central and southwestern portions of the Site are unfinished and consist of exposed bedrock, gravelly sands, levelled fill material, and a few shrubs and grass scrub.

Historically, since the early 1990's, the HIP Subdivision lands have been used for the placement of inert fill from construction and demolition projects as backfill, and as a temporary storage area for precast concrete pipe and chambers. The fill placement on the HIP lands represented materials that were being progressively used for backfill/leveling operations throughout the Industrial Park. A ditch used to convey groundwater pumped from the Rideau Road Quarries (Quarry #1 and Quarry #2) and the Dibblee Quarry (all located west/southwest of the Site) has been observed along the western and northern boundaries of the HIP subdivision. This ditch eventually flows into the Findlay Creek Municipal Drain at the northeast corner of the HIP subdivision. Findlay Creek Municipal Drain is situated along the northeastern boundary of the HIP subdivision.

1.3 Site Processes

The Facility is an aerobic composting operation that is approved to receive and process organics including source separated organics (SSO), leaf & yard waste, food wastes, commercial waste (restaurant wastes, etc.) and certain organic sludges. Organics are processed into a Non-Agricultural Source Material (NASM) and into animal bedding, or for other similar agriculturally beneficial applications. The Facility is designed to receive and process organics, to manage the resulting products and emissions, and to manage environmental impacts that are a result of the processing operations.

Storm water run-off from the Site drains to the on-Site SWM pond and is retained for use in Renewi's process, in accordance with the Site's ECA. If excess water is available in the SWM pond, then Renewi undertakes analysis and testing of the pond water. If analysis and testing show acceptable water quality, the excess stormwater is discharged into the HIP roadside ditch network.

1.4 MECP Correspondence to Date

The correspondence below documents selected communications between Renewi and the MECP with regards to the application, requested amendments, and subsequent issuance of the Site's current ECA (Industrial Sewage Works) No. 2844-9YNGZC (formerly covered under ECA No. 7251-8GKRPD):

- Application for Approval of Industrial Sewage Works, Storm Water Management Facility, Ottawa City, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; September 19, 2008) (CRA, 2008b).
- Proposed Groundwater/Surface Water Monitoring Program, Application for Approval of Industrial Sewage Works, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, City of Ottawa, Ontario, MOE Reference Number 4852-7KEQ29 (CRA; June 25, 2009).
- Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MOE; September 16, 2009).

- Summary of Pre-Start-up Groundwater/Surface Water Monitoring Program, Orgaworld Source Separated Organics Processing Facility, 5123 Hawthorne Road, Ottawa, Ontario (CRA; February 5, 2010a).
- Amendment Application, Deep Groundwater Monitoring Well Relocations, Certificate of Approval (Industrial Sewage Works) No. 9465-7NVRWT, Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2010b).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; September 7, 2010).
- Amendment Application, New Equipment Installation, Certificate of Approval (Industrial Sewage Works) No. 7032-88XPRA, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (CRA; March 18, 2010c).
- Amended Certificate of Approval (Industrial Sewage Works) No. 7251-8GKRPD, 5123 Hawthorne Road South, Lot Part of West Half of 27, Concession 6, Ottawa City, K1G 3Y3 (MOE; May 30, 2011).
- Letter RE: 2012 Groundwater/Surface Water Monitoring and Compliance Report, Orgaworld Organics Facility — SWM Pond, from Ministry of the Environment Ottawa District Office (MOE, September 13, 2013).
- Memorandum RE: Groundwater Assessment and Work Plan – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; July 16, 2014).
- Memorandum RE: Recommended Compliance and Trigger Level Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 3, 2015a).
- Memorandum RE: Proposed Monitoring Program – Orgaworld Canada Ltd., Ottawa, Ontario (CRA; February 27, 2015b).
- Environmental Compliance Approval – Application for Amendment (ECA No. 7251-8GKRPO), Orgaworld Canada Ltd., 5123 Hawthorne Road, Ottawa, Ontario (CRA; March 25, 2015d).
- Memorandum RE: Orgaworld Organics Facility 2015 Groundwater and Surface Water Monitoring Report, Trigger Level Program, 5123 Hawthorne Road, City of Ottawa- Hydrogeologic Assessment from Ministry of the Environment and Climate Change Water Resources Unit, Eastern Region (MECP, January 3, 2017a).
- Environmental Compliance Approval (Industrial Sewage Works) No. 2844-9YNGZC Organics Composting Facility, Part Lot 27, Concession 6, 5123 Hawthorne Road, City of Ottawa, Ontario (MECP, February 1 ,2017b).

2. Physical Setting

2.1 Site Geology

The Site-specific geology was determined through visual examination of the soil samples collected across the HIP subdivision lands during previous investigations and through examination of the stratigraphic logs.

A total of 19 monitoring wells and one extraction well have been completed in the shallow unconfined aquifer unit throughout the HIP subdivision, 16 of which have been completed within the limits of the Renewi Site.

Test wells (TW-1 to TW-6) were completed by Golder in 1993 and 2008. TW-1 through TW-6 extend into the deep bedrock aquifer unit which was identified as the Nepean bedrock formation (Golder Associates, 2008).

In May 2010, GHD oversaw the installation of two on-Site deep bedrock test wells (TW-7 and TW-8). The stratigraphic logs from GHD's monitoring wells confirmed the presence of sandstone but also identified limestone at TW-8.

Ontario Geologic Survey (OGS) mapping shows the Oxford Formation (Dolostone) covers much of the Site with the March and Nepean Formations (Dolostone/Sandstone formations) exist in the Northern portions of the HIP (OGS, Map 1508A).

The geological unit intercepted at each well is summarized in the monitoring well construction details provided in Appendix C for the overburden and deep bedrock wells. Monitoring location details are provided in Table 2.1.

Examination of the stratigraphic logs prepared by GHD indicates that the geology is generally consistent across the HIP subdivision. Five main geologic units were identified across the area investigated; these units are:

- Heterogeneous fill
- Topsoil layer
- Alluvial sand and silts
- Glacial till
- Bedrock

The topography and geology observed throughout the region are remnants of glacial scour, and more recently, marine deposits with some removal by fluvial erosion. The Site is located on a former quarry and thus filling activities have been carried out since the early 1990's which have significantly altered the local topography.

For 15 years or so prior to Facility construction, portions of the HIP subdivision have reportedly received inert fill from construction and demolition projects throughout the Ottawa area. The fill material received at the HIP subdivision was historically used to level some of the ground surface; however the southern and eastern areas have historically received very little amounts of fill.

The HIP subdivision is generally flat with the exception of the southwest corner, where there formerly existed a rock knoll, now a rock outcrop. The top of this rock outcrop is approximately 10 m higher than the surrounding grades of the HIP subdivision.

The geology and hydrogeology of the geological units identified are discussed below.

Fill

Results of borehole drilling and soil sampling investigations by GHD indicate that most of the HIP subdivision is overlain by fill material. The fill was found to be heterogeneous and generally consisted of a granular matrix (sand, silts, and gravel) with traces of construction waste (concrete, asphalt, wood, and brick), occasionally some clay, boulders, and dredged sediment. The fill material was generally observed to be in a compact and moist state.

Topsoil

The topsoil found was generally fine silty sand with organic material. It was dark brown to black in colour, and was generally loose and moist. Topsoil was found in most locations that were not used as roads. In several locations, the topsoil contained roots and wood debris.

Alluvial Sands and Silts

Underlying the fill and/or topsoil, alluvial sand and silt deposits were observed. Where encountered, these deposits were found to vary in density from loose to dense, and generally described as very moist to wet.

Glacial Till

A glacial till was encountered below the fill and/or alluvial sands and silts in the western half of the HIP subdivision. The glacial till encountered was predominately a silty sand matrix with some gravel, cobbles, and trace clay and boulders. The material was brown to grey in colour, was generally very moist to wet, and was in a compact to dense state. The glacial till was observed to be directly overlying the bedrock.

Bedrock

On a regional basis, the bedrock underlying the HIP subdivision consists predominantly of limestone, sandstone, and dolostone of the Nepean, March and Oxford Formations. Top of bedrock was observed at depths varying from surface outcrops to a depth of approximately 7.6 metres below ground surface (m bgs) at the location of MW6-08. Bedrock core extending from 1.1 to 2.6 m into the bedrock was collected from MW2-08 and MW4-08 to identify and characterize the bedrock. The bedrock at MW2-08 and MW4-08 was described as fractured grey limestone. The bedrock was generally found to be fractured in the upper meter, where core recovery ranged from 93 to 94 percent and Rock Quality Designation (RQD) ranged from 63 to 75 percent. At depths in excess of 1 m into the bedrock, at MW2-08, the bedrock was found to be more competent with a recovery of 100 percent and a RQD of 93 percent.

2.2 Site Hydrogeology

Based on the review of information, the geological sequence observed at the HIP subdivision can be grouped into the two main hydrogeological units:

- A shallow unconfined groundwater unit (referred to as shallow unconfined aquifer) within the permeable fill, alluvial sands and silts and shallow fractured bedrock.
- A deep confined bedrock unit (referred to as the deep bedrock aquifer).

The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA, 2008a). Additional groundwater information regarding groundwater flow direction and velocity within the unconfined shallow aquifer unit is discussed in Section 4.1.

As part of GHD's Phase II ESA in 2008 (CRA, 2008a), an assessment of the connectivity between the shallow unconfined aquifer unit and the underlying deep bedrock aquifer unit was conducted by performing pumping tests at TW-1 through TW-3 in the deep bedrock aquifer unit. During the pumping test, water levels gathered from the shallow unconfined aquifer unit indicated no corresponding drawdown between the shallow and deep wells. Water levels in the deep bedrock aquifer unit lowered from 1.2 to 3.7 m during the 6-hour period. Based on the data, it was concluded that the shallow unconfined aquifer unit and the deep bedrock aquifer units are not hydraulically connected.

2.3 Surface Water and Drainage Features

Surface water run-off from the HIP subdivision generally drains through local ditches to Findlay Creek Municipal Drain, to Shields Creek, to North Castor River, to South Nation River, and then to the Ottawa River.

A series of ditches within the Site drains to the on-Site SWM pond. The flow of the water from the SWM pond is controlled by a valve that outlets to a ditch which runs along the HIP subdivision internal roadway (Somme Street), towards the east through a central SWM pond, eventually out letting to Findlay Creek.

Another ditch runs along Hawthorne Road, flowing towards and eventually along Rideau Road, connecting to Findlay Creek; this ditch does not connect to the Renewi Site at Hawthorne Road or to Somme Street.

2.4 Groundwater Use

Water well data reviewed by GHD shows that the shallow unconfined water table unit is not locally used as a potable water source (Golder, 2008) (deemed unsuitable due to proximity to ground surface, limited saturated thickness, and low yield). The water well records indicate that the deep bedrock aquifer test wells located in proximity of the HIP subdivision are all installed within the deep bedrock aquifer formation at depths generally at or in excess of 30 m bgs (Appendix C2). Bottled water is brought in for consumption at the Site, while water from TW-4 supplies sinks, showers, toilets, and the dishwashing machine for the Facility. As necessary, TW-4 is also used as an alternative refilling source for replenishing the fire suppression water holding tank.

3. Monitoring Program

In accordance with recommendations of the Groundwater/Surface Water Monitoring Program (CRA, 2009) and Amendment Application (CRA, 2010b), GHD has completed ongoing monitoring from 2009 to present.

The following monitoring activities were completed at the Site during the current monitoring period:

- May 2018 - Semi-annual sampling:
  - Sampling at four surface water locations (SW-1 to SW-4)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
  - Collection and analysis of QA/QC samples

- August 2018 - Tri-annual sampling:
  - Hydraulic monitoring and sampling at six shallow unconfined aquifer wells (MW5-09, MW101-13, MW102-09, MW104-13, MW105-13, and MW106-15)
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
  - Collection and analysis of QA/QC samples
- November 2018 - Semi-annual sampling::
  - Sampling at four surface water locations (SW-1 to SW-4)
  - Sampling and hydraulic monitoring at all shallow unconfined aquifer and deep bedrock aquifer wells
  - Sampling and hydraulic monitoring at the extraction well, EW107-15
  - Hydraulic monitoring of the staff gauges in the northern ditch
  - Collection and analysis of QA/QC samples

3.1 Monitoring Network

Currently the groundwater monitoring network consists of the following monitoring wells:

- Shallow unconfined aquifer unit: twelve groundwater monitoring wells and one extraction well: MW01-08, MW2-08, MW3-08, MW4-08, MW4-09, MW5-09, MW101-13, MW102-09, MW103-09, MW104-13, MW105-13, MW106-15, and EW107-15.
- Deep bedrock aquifer unit: three monitoring wells: TW-4, TW-7, and TW-8.

Surface water quality is monitored through four surface water monitoring locations (SW-1 to SW-4). Surface water level monitoring in the northern ditch is monitored by the four staff gauges (SG-1 through SG-4).

Table 3.1 provides a summary of the 2018 monitoring program.

The groundwater and surface water monitoring locations within the HIP subdivision are provided on Figure 3.1. Figure 3.1 also shows the Site limits included in the Renewi lease and the boundary of the HIP subdivision.

Figure 3.2 shows the groundwater and surface water locations on the Renewi Property.

3.2 Monitoring Protocol

3.2.1 Groundwater Monitoring

The depth to groundwater was measured using an electronic water level meter with the top of the monitoring well riser pipe as the reference point, or to the top of the steel casing for all deep bedrock aquifer monitoring wells. Groundwater elevations were subsequently calculated for each monitoring well by subtracting the depth to water measurement from the reference point elevation.

Groundwater samples were collected by following GHD's field method guideline protocols, which are consistent with MECP requirements. All shallow aquifer monitoring wells and deep aquifer monitoring wells, except TW-8, were purged and sampled using low-flow sampling techniques with dedicated polyethylene tubing and a peristaltic pump. Wells were sampled following stabilized field readings.

Due to the greater depth to groundwater, deep bedrock aquifer unit monitoring well TW-8 was sampled using low-flow methods with dedicated polyethylene tubing and a bladder pump system.

During mid-2016, a dedicated sampling port was installed in the Facility to facilitate sampling from EW107-15. The sample is collected after the extraction well and sample port are purged for several minutes to ensure the sample port and associated lines are clear of stagnant water.

The samples collected for metals analysis were field filtered using disposable 0.45 µm in-line filters. All groundwater samples collected were submitted to ALS Environmental (ALS) of Waterloo, Ontario for analysis under standard chain-of-custody protocol. Analytical results are discussed in Section 4.

The analytical parameter list for groundwater is summarized in Table 3.1.

The original laboratory analytical reports are provided in Appendix D.

3.2.2 Surface Water Monitoring

Surface water samples were collected at four locations (SW-1 to SW-4) following GHD's field method guidelines. Surface water samples were collected by gently immersing the sample bottles in the ditch, creek or pond water, taking care not to disturb the underlying sediments. Readings for pH, conductivity, dissolved oxygen, oxidation reduction potential (ORP), turbidity, and temperature were recorded at the time of sample collection. All surface water samples were collected without field filtering and as such, represent total parameter concentrations. It should be noted that potential dissolution of particulates by the acid preservative in the metals sample bottles can artificially increase parameter concentrations in surface water samples. Acid preservation is a standard method for preserving water samples for metals analysis. All surface water samples collected were submitted to the laboratory for analysis under standard chain-of-custody protocol. The sample parameter list for surface water sampling is the same as the parameter list for groundwater (refer to Table 3.1).

Hydraulic level monitoring is completed at four staff gauges located throughout the roadside ditch adjacent to the Site along the south side of Somme Street. The depth to standing-surface water was visually observed to be nil/dry during all three of the staff gauge monitoring events in 2018.

3.3 Quality Assurance/Quality Control Program

A QA/QC program was undertaken as part of the Monitoring Program. This program involved the collection and analysis of field duplicate samples and the evaluation of standard laboratory quality control samples and procedures. The potential for contamination of samples through field and laboratory procedures is monitored through the analysis of field and laboratory blanks and duplicates samples.

The quality control parameters were found to be within acceptable ranges of standard laboratory practice. Several qualifications of the 2018 analytical data were made through the QA/QC assessment.

Details of the QA/QC Assessment for the current monitoring period are provided in Appendix D. The qualifications indicated in Appendix D do not significantly alter the interpretation of the data or affect the conclusions provided in this report.

4. Monitoring Results

The results of the Monitoring Program for the current monitoring period are presented in the following sections as follows:

- Section 4.1 - Groundwater Hydraulic Monitoring
- Section 4.2 - Water Quality Monitoring

To better facilitate discussion of the water quality, the sampling points for the Monitoring Program have been divided into the following areas: shallow unconfined aquifer unit, deep bedrock aquifer unit, and surface water. Each is discussed in an upgradient to downgradient or upstream to downstream fashion.

4.1 Groundwater Hydraulic Monitoring

Groundwater elevation data collected during the current monitoring period is presented in Table 4.1. Groundwater elevations measured during the May and November 2018 monitoring events are consistent with those observed historically at the Site, and were used to develop groundwater contour figures, as presented on Figures 4.1 to 4.4. Shallow unconfined aquifer and deep bedrock aquifer groundwater elevations and contours for the May 2018 monitoring event are presented on Figures 4.1 and 4.3, respectively, and shallow unconfined aquifer and deep bedrock aquifer groundwater levels and contours for the November 2018 monitoring event are presented on Figures 4.2 and 4.4, respectively.

The shallow aquifer water table was encountered at elevations varying from 90.46 to 98.32 metres above mean sea level (m AMSL) at MW103-09 and MW3-08 during the May monitoring event and 90.47 to 98.51 mAMSL at MW103-09 and MW3-08 during the November event. The depth below grade to the shallow aquifer water table varied from 0.79 to 5.23 metres below ground surface (mBGS) at MW5-09 and MW3-08 during the May monitoring event and 0.15 and 5.04 mBGS at MW2-08 and MW3-08 during the November event. The groundwater elevations measured at MW1-08 during 2018 were above the surveyed ground surface elevation by 0.08 and 0.05 m for the May and November events respectively. This is due to the low ground surface elevation around the stormwater management pond. Based on the groundwater elevations gathered in May and November 2018, flow occurs in an east-northeast direction in the shallow unconfined aquifer. This is consistent with previous monitoring years.

The horizontal hydraulic gradients for the shallow unconfined aquifer unit for the May and November 2018 monitoring events were estimated from groundwater contours presented on Figures 4.1 and 4.2 to be approximately 0.02 m/m across the Site. The horizontal hydraulic conductivity determined from single well response tests ranged from less than 1.0×10^{-7} cm/sec to 4.4×10^{-4} cm/sec (CRA 2008b). Assuming an effective porosity of 40 percent for the shallow unconfined aquifer unit, an estimate of the groundwater flow velocity can be determined from the following equation:

$$v = \frac{Ki}{n}$$

Where:

v = groundwater flow velocity (L/T)

K = hydraulic conductivity (L/T)

i = horizontal hydraulic gradient (unitless)

n = effective porosity

Based on this equation, the local groundwater velocity is estimated to range from a few millimeters per year to a high of approximately 6.4 m per year in the fill deposits and shallow fractured bedrock. Note that the hydraulic conductivity was estimated prior to development of the Site and may not be reflective of the current conditions at the Site.

During the 2018 monitoring period, the deep bedrock aquifer unit groundwater levels ranged from a low of 83.30 m AMSL (TW-8) to high of 90.54 m AMSL (TW-7). The seasonal water level fluctuation ranged from 0.20 m (TW-4) to 0.99 m (TW-8). Based on the 2018 groundwater elevations, groundwater in the deep bedrock aquifer unit flows in a west-southwest direction, which is opposite to the flow direction of the shallow unconfined aquifer unit. It is likely that the presence of a quarry to the west and southwest of the Site has influenced the groundwater flow direction within the deep bedrock aquifer unit. This is consistent with previous interpretations of groundwater flow across the Site.

Based on groundwater contours generated for the Site, hydraulic gradients for the deep aquifer unit were calculated at 0.018 and 0.015 m/m for the May and November 2018 events, respectively.

4.2 Water Quality Monitoring

The following Sections provide a discussion regarding the spatial and temporal trends of selected indicator parameters at the Site.

4.2.1 Shallow Unconfined Aquifer Unit Groundwater Quality

Groundwater flow in the shallow unconfined aquifer occurs in an east-northeast direction, as illustrated on Figures 4.1 and 4.2. According to the position relative to the Facility, the groundwater monitoring wells can be grouped as:

- Upgradient wells: MW3-08 and MW4-09
- Upgradient/cross gradient wells: MW2-08
- Facility Area: EW107-15, MW101-13, and MW105-13
- Downgradient: MW1-08, MW5-09, MW102-09, MW103-09, MW104-13, and MW106-15

Tabulated analytical results for the shallow unconfined aquifer from the 2018 sampling program are provided in Table 4.2.

On behalf of Renewi, GHD completed a Groundwater Assessment and Work Plan in July 2014 (Groundwater Assessment, Appendix B3). The Groundwater Assessment evaluated the 2013 and historical groundwater quality in order to determine appropriate parameters of concern for the Site.

Previous evaluations of groundwater quality at the Site identified ammonia as the primary indicator parameter for facility-related groundwater quality impacts at the Site. The Groundwater Assessment confirmed the presence of an ammonia plume within the shallow unconfined aquifer unit.

The Groundwater Assessment also identified additional parameters of concern through a comparison of the 2013 water quality data to background water quality and the MECP criteria listed in the Ontario Drinking Water Standards (ODWS) (MOE, 2003, as amended). The comparison identified the following additional indicator parameters for identifying potential groundwater impacts from Facility operations: iron, manganese, dissolved organic carbon (DOC), sulfate, and total dissolved solids (TDS).

Ammonia and DOC are commonly used as indicators of groundwater quality impacts associated with the discharge of organic waste related contaminants to the subsurface. Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Figures 4.5 through 4.8 provide concentration isopleths (lines of inferred equal concentration) for ammonia, dissolved iron, dissolved manganese, and DOC. The 2018 median concentrations from the shallow unconfined aquifer unit monitoring wells have been used to create the isopleths. Concentration isopleth figures are useful for evaluating and presenting spatial patterns in groundwater chemistry.

On Figures 4.5 through 4.8, the presence of elevated concentrations of the indicator parameters are identified in close proximity to, or just downgradient from, the Facility. The elevated concentrations appear to extend from the Facility to the east-northeast following the direction of groundwater flow. Some decreases in concentrations are observed with increased distance from the facility (following the path of groundwater flow in the shallow unconfined aquifer) for ammonia in particular and concentrations remain low to the west, south, and southeast of the Facility. Note that due to the highly variable concentrations of iron and manganese at EW107-15 water quality from this location has not been included in the contouring presented on Figures 4.6 and 4.7. Periodic pumping at EW107-15 is suspected to contribute to the highly variable water quality observed at this location. Further discussion of the extraction well is provided in Section 5.

The pattern of iron and manganese concentrations presented on Figures 4.6 and 4.7 is different than that observed for ammonia and DOC in that the concentrations reported in close proximity to the Facility are lower than those reported at the downgradient Site boundary. 2018. Continued monitoring will provide insight into the evolution of these parameters near and downgradient from the Facility.

This distribution of elevated concentrations of ammonia, DOC, and to a lesser extent iron, and manganese is consistent with a contaminant plume related to an organic contaminant source.

The 2018 median concentrations show that elevated DOC, iron, and manganese concentrations extend to MW103-09, located in the northeastern corner of the Site, but that elevated ammonia is limited to the western side of the stormwater management pond or the Northern Ditch (in the vicinity of MW102-09). This indicates that there may be an additional source of DOC, iron and manganese contributing to the elevated concentrations at MW103-09 possibly not related to the Facility.

Figures 4.9.1 to 4.9.12 present the evolution of groundwater chemistry at the wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

The following tables provide summaries of the trends and concentration ranges for ammonia in the shallow unconfined aquifer:

Location	Trend	Ammonia Concentration Range (mg/L)	
		Historic (pre-2018)	**2018**
MW4-09	↑	ND(0.050) – 0.294	0.063 – 0.554
MW3-08	↑	ND(0.020) – 0.264	0.218 – 0.224
MW2-08	↑	ND(0.020) – 0.161	0.133 – 0.171
EW107-15	↓	0.123 – 88.0/91.1	0.927 – 28.2/28.3
MW105-13	↓	4.88 – 76.0	12.2 – 33.0/33.2
MW101-13	Stable	0.237 – 34.9	11.5 – 23.0
MW104-13	Stable to ↑	1.20 – 14.3	6.13 – 20.0
MW5-09	↓ (2015-2017) and ↑ (2018)	0.32 – 31.4	10.7 – 19.2
MW102-09	↑	ND(0.050) – 10.6	9.8/10.8 – 15.2
MW1-08	↑	0.335 – 2.08J	2.24 – 3.67
MW103-09	Stable	0.508 –2.35	0.217/0.255 – 1.55/1.74
MW106-15	↑	1.91 – 10.0	5.44 – 18.6

Notes:
ND non-detect at the associated value
/ - indicates duplicate analytical results

As presented above, each of the upgradient locations have shown relatively stable and low ammonia levels. MW2-08 is located cross-gradient from the Facility and has shown little evidence of impacts. Ammonia concentrations at MW2-08 have shown some evidence of increases in recent monitoring, however concentrations remain low.

During the 2018 reporting year, overall trends in ammonia concentrations have been decreasing, particularly near the facility. Ammonia concentrations at MW105-13 and MW101-13 previously showed increasing trends. Current analytical data indicates declining and stable trends at each facility area well. The analytical results for EW107-15 show highly variable concentrations during the period of operation of this extraction well. Active pumping at this location is suspected to be the source of the observed variability. Notwithstanding the fluctuations, the presence of elevated ammonia in the extraction well indicates that active groundwater extraction at this location is an appropriate remedial strategy.

Ammonia concentrations at MW5-09 followed a clear increasing trend between 2009 and mid-2015. Monitoring results from 2016 through 2018 demonstrate a stable trend with ammonia concentrations ranging between 10 mg/L and 20 mg/L. Renewi's efforts to eliminate the source of subsurface discharge through the improved maintenance of the existing ammonia scrubber, along with the remediation of the zone of elevated ammonia adjacent to the facility through operation of EW107-15, are likely responsible for the observed improvements in water quality at MW5-09 during this period. It should be noted that Renewi

intends to implement capital improvements through replacement of the existing ammonia scrubber with three new replacement units.

Ammonia concentrations at downgradient locations showed a reversal in the improving trends from prior to 2017 with elevated concentrations in 2018. Monitoring locations MW1-08, MW102-09, MW104-13, and MW106-15 all had ammonia results that exceeded the historical ranges from each location. The ammonia trends downgradient of the facility are all increasing with the exception of MW103-09 which continues to show stable concentrations. Further sampling will determine if these trends continue. MW5-09 and MW102-09 continue to exhibit elevated concentrations downgradient of the Facility and adjacent to the run-off ditches to the north the Site.

The following table summarizes recent trends in iron and manganese concentrations within the unconfined shallow aquifer monitoring well network.

Location	Trend	Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)	
		Historic (pre-2018)	**2018**	**Historic (pre-2018)**	**2018**
MW4-09	↓	0.045 – 1.86	ND(0.010) – 0.15	0.0711 – 1.25	0.0556 – 0.154

Elevated concentrations of dissolved iron and manganese are apparent in the facility area and downgradient of the facility, with the most elevated concentrations being reported at MW105-13, MW104-13, MW5-09, MW102-09, MW106-15, and MW1-08. As discussed above, iron and manganese concentrations in the interpreted source area adjacent to the facility were observed to decrease in 2017-2018 as compared to previous monitoring years.

The principal observation with respect to trends in iron and manganese concentrations within shallow groundwater at the Site is that concentrations have generally followed trends of decreasing levels over time. The exception to this observation is near the downgradient Site boundary where iron concentrations

continue to increase. It is expected that these concentrations will stabilize and decrease with time in response to Renewi's efforts to control releases to the subsurface.

The following table summarizes recent trends in DOC concentrations within the unconfined shallow aquifer monitoring well network.

Location	Trend	DOC Concentration Range (mg/L)	
		Historic (pre-2018)	**2018**
MW4-09	Stable	1.0 – 3.5	2.0 – 2.36
MW3-08	Stable	1.5 – 3.5/9.0	1.9 – 5.09
MW2-08	↑	1.5 – 10.0	4.6 – 7.67
EW107-15	Stable	3.2 – 965/1,030	9.28 – 12.1
MW105-13	Stable to ↑	2.6 – 16.0	5.64 – 10.1/10.7
MW101-13	Stable	3.6 – 14.8	8.86 – 14.6
MW104-13	↓	5.5 – 51.2	10.2 – 11.4
MW5-09	Stable	5.4 – 13.0	7.5/8.4 – 12.4
MW102-09	↓	ND(1.0) – 18.5	9.6/9.7 – 12.5
MW1-08	Stable	6.2 – 10.7	8.8 – 9.05
MW103-09	Stable	3.0/8.9 – 17.9	8.0 – 15.1/16.9
MW106-15	Stable	8.0 – 13.0	9.4 – 10.3

Notes:
ND non-detect at the associated value.
/ - indicates duplicate analytical results

The current levels of DOC have remained consistent with some minor decreasing trends at MW104-13 and MW102-09. Concentrations of DOC are relatively low in the upgradient monitoring wells. Monitoring wells located downgradient of the Facility had previously demonstrated trends of elevated and increasing levels of DOC. Over the past monitoring year many of the concentrations have demonstrated decreasing or stable trends. Water quality at EW107-15 is highly variable, likely due to intermittent pumping at this location.

In general, the increases in DOC concentrations downgradient of the facility relative to upgradient concentrations are minor compared to those observed for ammonia, iron or manganese.

Shallow Groundwater to Surface Water Discharge

In comments provided by the MECP on the 2012 annual report, the MECP requested that a comparison of shallow groundwater quality at MW103-09 to PWQOs be completed as part of future annual monitoring reports. Table 4.2A provides the 2018 analytical data for MW103-09 along with the PWQOs for comparative reference, with exceedances highlighted.

As indicated in Table 4.2A, several parameters exceeded their respective PWQOs at MW103-09 during the current monitoring period. The following provides a summary of those exceedances:

- Iron – 4 of 4 samples
- Phosphorus – 2 of 4 samples
- Field Measured Dissolved Oxygen – 2 of 2 measurements

The Groundwater Assessment included recommendations to further investigate the relationship between shallow groundwater and surface water. Recommendations included that staff gauges be installed at four points within the northern ditch system and that a topographic survey of the northern portion of the Site, including the ditch, be undertaken.

Topographic surveying of the northern ditch system (including the ditch which drains into the SWM Pond and the ditch that continues towards Findlay Creek – the HIP Ditch) was completed and the four staff gauges were installed in early 2015. The Site's northern ditch was dry at each of the staff gauge locations during each monitoring event in 2018, which provides some evidence that a significant volume of groundwater is not likely continuously discharging to the creek.

Figure 4.10 presents the results of the topographic surveying of the northern ditch overlain by the May 2018 groundwater contours. The topographic contours are provided in 0.5 m intervals with the lowest elevation presented representing the bottom of the ditch.

As shown in Figure 4.10, the topography of the ditches is 'w' shaped. The two ditch valleys or troughs travel parallel to the northern Site boundary with the on-Site ditch (that drains to the SWM Pond) found south of the HIP ditch. The inferred groundwater elevations from May 2018 coincide closely with the bottom elevation of the ditches, and are above the bottom of the northern (roadside) ditch in several locations. These locations are illustrated on Figure 4.10 and are interpreted to be areas where shallow groundwater is discharging to the northern ditch. It should be noted that cattails and other hydrophyllic vegetation are present in portions of this ditch providing further evidence support to the interpretation that some groundwater is discharging to the ditch.

Figure 4.10 further shows that a substantial portion of the ditch bottom is higher than groundwater elevations where the ditch is intersected by the extrapolated contours. Therefore, groundwater is likely discharging to the ditch, particularly during periods of high groundwater levels (typically during the spring).

However, as noted above each of the staff gauge locations did not contain sufficient standing or flowing water for sampling during the 2018 monitoring events (or during any previous monitoring events). Based on the information available, the volume of groundwater seeping into the ditch is too low to maintain a consistent base flow. It is likely that groundwater seepage into the ditch is largely lost to evapotranspiration.

In conclusion, small volumes of groundwater are likely seeping to the north roadside ditch but the volumes are insufficient to form a base flow. Based on current available information, groundwater discharging to the ditch is unlikely to cause any adverse impacts to the surface water bodies in the vicinity of the Site.

4.2.2 Deep Bedrock Aquifer Groundwater Quality

Based on the available data for the deep bedrock aquifer, groundwater flow in the deep bedrock aquifer occurs to the southwest across the Site, as illustrated on Figures 4.3 and 4.4. According to their position relative to the Facility, the deep bedrock groundwater monitoring wells can be grouped as:

- Upgradient well: TW-7
- Downgradient wells: TW-4, TW-8

The discussion regarding the evolution of the selected parameters will be applied in the same way as for the shallow unconfined aquifer.

Tabulated analytical results for the deep bedrock aquifer from the 2018 sampling program are provided in Table 4.3.

Because the deep bedrock aquifer is a potential source of drinking water in the vicinity of the Site, Table 4.3 also provides a comparison of the deep bedrock water quality to the Ontario Drinking Water Quality Standards (ODWQS) (Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, MOE, June 2003, revised June 2006 and July 2017).

Table 4.3 shows that several parameters have frequently been reported above their respective ODWQS in samples collected from each of the deep bedrock wells (TW-4, TW-7, and TW-8). The following provides a summary of the parameters reported above their ODWQS limits at least once in 2018:

Location	ODWQS Exceedances	
	June 2018	November 2018
TW-7 (upgradient)	Iron, manganese, turbidity (field)	pH (field), turbidity (field)
TW-4 (downgradient)	Iron, manganese, alkalinity, turbidity (field)	Iron, manganese, E. Coli, turbidity (field)
TW-8 (downgradient)	Iron, manganese, turbidity (field)	Turbidity (field)

ODWQS Operational Guidelines as well as the criteria for temperature and turbidity do not relate directly to water samples collected from monitoring wells. The criteria for each are included in the ODWQS as they related to the effectiveness of water treatment and are thus not relevant to samples collected from groundwater monitoring wells. Alkalinity and pH concentrations should be given consideration in the evaluation of water quality; however, the ODWQS established for these parameters are Operational Guidelines set for water treatment plant operations and thus these Guidelines are not relevant to evaluations of water quality samples from groundwater monitoring wells.

Table 4.3 shows that water quality within the deep bedrock aquifer was poor in 2018 (this is consistent with historical water quality within the deep bedrock aquifer – Appendix E). Based on the upgradient water quality from TW-7 and the surrounding land uses there are several potential upgradient sources of water quality impairments within this aquifer.

Water quality results from the both downgradient wells show that operations at the Facility may have potentially affected the already poor water quality. Figures 4.11.1 to 4.11.3 present the evolution of groundwater chemistry at the deep bedrock wells across the Site for the selected indicator parameters; these figures assist in visually identifying temporal trends in groundwater chemistry and are thus useful for understanding the historical evolution of groundwater.

		Ammonia Concentration Range (mg/L)		DOC Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2018)**	**2018**	**Trend**	**Historic (pre-2018)**	**2018**
TW-7	↑ to stable	ND(0.05) – 0.825	ND(0.128) – ND(0.282)	↓	2.1 -15.1	2.7 – 6.14
TW-4	↑ to stable	0.218 – 3.72	ND(0.812/0.871) – 13.0	stable	4.4 – 8.0	5.6/5.7 – 10.4
TW-8	↓ to stable	ND(0.050) – 4.60	ND(0.063) – ND(0.385/0.395)	↓	1.9 – 13.5	ND(2.95) – 2.1/3.7

		Iron (dissolved) Concentration Range (mg/L)		Manganese (dissolved) Concentration Range (mg/L)		
Location	**Trend**	**Historic (pre-2018)**	**2018**	**Trend**	**Historic (pre-2018)**	**2018**
TW-7	↓	ND(0.010) – 11.1	ND(0.010) – 0.331	↓	0.0352 – 1.71	0.0428 – 0.175
TW-4	↓	ND(0.050) – 3.30	0.69/0.75 – 2.26	↑	0.496 – 1.94	1.42 - 1.42/ 1.51
TW-8	↓	ND(0.050) – 6.25	0.024 – 0.34/0.50	↓	0.0256 – 2.95	0.00640 – 0.185/0.187

Concentrations of ammonia showed notable decreases between late 2014 and 2016 at the downgradient monitoring wells; however, the presence of ammonia at concentrations elevated above upgradient levels suggests that Facility operations may have had a minor effect on water quality in the deep bedrock aquifer. Ammonia concentrations in the upgradient monitoring well have steadily remained below or near the detection limits, with the exception of the unusually elevated ammonia concentration in the November 2017 sample.

The ammonia concentration reported at TW-4 in November 2018 (13.0 mg/L) is inconsistent with previous concentration ranges. Further monitoring is required to verify if this result is indicative of water quality at this location.

A pumping test completed in 2008 showed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. The overall pattern of groundwater quality within the deep bedrock aquifer suggests that water quality is naturally poor. It is recommended that monitoring results for downgradient deep bedrock aquifer monitoring wells continue to be reviewed and assessed for potential facility-related water quality impacts. If trends of deteriorating water quality are consistent, consideration should be given to undertaking further investigation or evaluating the need for a remedial strategy. Based on the monitoring results from the 2018 monitoring period, no additional investigation or remedial activities are necessary at this time, however indicator parameter concentrations at TW-4 should be closely monitored during future monitoring events.

4.2.3 Surface Water Quality

Analytical results for surface water samples collected from the storm water management pond (SW-4) and local ditch monitoring locations (SW-1 through SW-3) are presented in Table 4.4 and compared to the Provincial Water Quality Objectives (PWQO). The following table summarizes the surface water monitoring parameters that did not meet the PWQO during the 2018 sampling events.

Location	Parameter	PWQO (mg/L)	Spring (mg/L)	Fall (mg/L)
SW-2	Iron	0.3	0.513	0.230
SW-2	Phosphorus	0.01	0.0232	0.0152
SW-3	Iron	0.3	0.410	0.216
SW-3	Phosphorus	0.01	0.0219	0.0192
SW-3	Escherichia Coli	100*	270*	18*

Location	Parameter	PWQO (mg/L)	Spring (mg/L)	Fall (mg/L)
SW-4	Phosphorus	0.01	0.0886/0.0935	0.0748
SW-4	Dissolved Oxygen	<5.0/<4.0**	3.73	-

Notes:
*- Escherichia Coli concentrations are in colony forming units per 100 mL (CFU/100 mL)
** - temperature and species dependent
0.0537/0.0653 indicates duplicate analytical results

In general, water quality at the downstream surface water monitoring location (SW-3) is similar to upstream surface water monitoring location (SW-2), which indicates that contributions to surface water flow from the Renewi facility aren't impacting downstream water quality.

Concentrations of phosphorus were consistently above the PWQO at each of the monitoring locations, with the exception of SW-1 in 2018. In addition, elevated iron concentrations were noted at SW-2 and SW-3. E. coli levels were in exceedance of the PWQO in the spring 2018 sample from SW-3.

Previous assessments of the Site concluded that concentrations of ammonia were showing increases at SW-4. Temporal concentration versus time plots for ammonia, DOC, manganese, and iron levels at SW-4 are presented on Figure 4.12. Figure 4.12 shows that ammonia concentrations are variable with elevated concentrations reported during late 2014, 2016 and late 2017 to early 2018. An overall trend of increases in ammonia concentrations within SW-4 between 2011 and 2018, as illustrated on Figure 4.12. As discussed below, Renewi installed six aerators within the stormwater management pond during 2018 to improve water quality within this pond.

As discussed in Section 4.2.1, the potential for shallow groundwater to discharge to surface exists within the northern ditch and stormwater management pond. The presence of un-ionized ammonia at elevated concentrations in SW-4 is likely related to the discharge of impacted groundwater directly to the SWP or via overland flow of impacted runoff entering the pond.

A total of 11 additional samples were collected by Renewi staff at surface water monitoring location SW-4 during the 2018 monitoring period. Renewi staff collected monthly samples when the surface water was unfrozen (the pond was frozen in January and February). Renewi collected two samples during May. The analytical results for these samples have been included in Table 4.5 with results highlighted that did not meet their respective PWQO and the ECA discharge criteria. As indicated in Table 4.5, parameter concentrations that did not meet their respective PWQO were noted for:

- Escherichia Coli
- Phenols
- Total Phosphorus
- Un-Ionized Ammonia
- Field Measured Dissolved Oxygen

Water was discharged from the stormwater management pond twice during the 2018 monitoring period in April and late June into July. The surface water quality results were compared to the trigger level

parameters presented in the ECA prior to discharges to determine that the concentrations of trigger parameters were below the discharge criteria. All analytical results for samples collected prior to discharge were below their respective trigger levels. On this basis, all stormwater management pond discharge events were in compliance with the ECA trigger levels (outlined in Table 2 of the ECA) during 2018.

The stormwater management pond had a total of six aerators installed to improve the water quality by agitating and oxygenating the ponded water. The first aerator was installed on July 10, 2018 and an additional five were installed on November 28, 2018. 2019 sample results will provide insight into the effect of the aerators on the surface water quality in the pond.

Based on the results of the surface water monitoring, there were no measureable effects on downstream surface water quality from the discharges during the 2018 monitoring period.

5. Shallow Groundwater Extraction System

Beginning on October 4, 2016 regular pumping from shallow groundwater extraction well EW107-15 commenced. The daily volumes pumped from EW107-15 from October 4, 2016 through December 31, 2017 are summarized in Table 5.1. The 2018 pumping data was intermittently recorded due to downtime associated with the tie-in of the extraction well pump controller to the Facility's SCADA system and the removal of the existing flow meter. EW107-15 was not pumped frequently from January 1 to June 1, 2018 with only a total volume of 0.1896 m^3 pumped during this period. The pumped volumes between June 1 and October 1, 2018 were not recorded due to the SCADA system tie-in downtime described above. The well was intermittently pumped during this period. On October 1, 2018 the SCADA system was brought online and the volumes pumped during October, November, and December are summarized in Table 5.1.

As previously mentioned, EW107-15 was sampled three times during the current reporting period with all three samples collected via the dedicated sampling port. The following table provides a summary of the 2018 indicator parameters:

Parameter (mg/L)	May 16, 2018	August 15, 2018	November 9, 2018
Ammonia-N	28.2/28.3	3.79	0.927
Iron (dissolved)	ND(0.10)	4.20	0.18
Manganese (dissolved)	0.435/0.441	1.42	1.21
DOC	12.1	12.0	9.28

Notes:
0.537/0.653 indicates duplicate analytical results

There is a notable difference in the concentrations reported in the all three sample results. Groundwater quality at the Site is seasonally variable and the extent to which the groundwater extraction well was active prior to the sample collection, as shown in Table 5.1, also likely contributes to the variability in the results. The May sample was collected during a period of no pumping and the November sample was collected during a period of more regular pumping. As mentioned above, there is no record of pumping during August due to the SCADA tie-in period but the Site staff indicated that the well was indeed being pumped intermittently during this period.

There is currently insufficient data to quantify the effectiveness of the extraction well at controlling or reducing groundwater impacts at the Site, however water quality results for the 2016 through 2018 monitoring periods suggest some improvement in water quality in the vicinity of EW107-15. This improvement is likely related to Facility improvements made to control the source of discharge and active groundwater extraction within the interpreted historical source area. It is expected that continued/improved operation of the shallow groundwater extraction well will, over time, remove the most impacted groundwater from the facility area. This will result in improved water quality in both the facility area and downgradient plume which should, in turn, reduce the occurrence of Tier I trigger exceedances.

Future assessments of water quality (i.e., the 2019 annual report) will be used to evaluate the effectiveness of the extraction well at controlling the downgradient migration of Facility-related groundwater quality impacts.

6. Compliance and Trigger Level Program

Condition 9(3b) of the amended ECA (2011) requires the development of trigger level criteria in accordance with MECP Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). In a memorandum to the MECP, dated February 27, 2015, GHD provided an outline for a recommended Compliance and Trigger Level Program (TLP). A copy of the memo is included in Appendix B1. The memo provides a detailed history of developing the TLP as well as the three tiered approach to evaluating compliance at the Site.

The following Sections provide a brief summary of the key points of the TLP and an assessment of the current water quality.

6.1 Trigger Parameters

A focused set of parameters which are related to the sources of potential impacts from on-Site activities were selected for the purposes of the TLP. The TLP parameter list includes the following trigger parameters: ammonia, phosphorus, DOC, nitrate, iron, manganese, alkalinity, and E. Coli. Ammonia, phosphorus, DOC, nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic sources due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

6.2 Trigger Concentrations

The following table provides the trigger levels for the above-referenced trigger parameters.

The trigger levels for the shallow unconfined aquifer are based on the 95 percent upper-tolerance limits (UTLs) for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.). More detail on how the trigger concentrations were calculated is provided in Appendix B1.

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the deep bedrock aquifer. As an alternative, 95 percent UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g., parametric-gamma, non-parametric, etc.)

The following table provides the trigger levels for the above-referenced trigger parameters for the shallow and deep bedrock aquifer units.

Parameter	Shallow Unconfined Aquifer Trigger Level	Deep Bedrock Aquifer Trigger Level
Ammonia	4.0 mg/L	0.2 mg/L
Phosphorus	7.2 mg/L	0.5 mg/L
Dissolved Organic Carbon	34.6 mg/L	18.4 mg/L
Nitrate	1.3 mg/L	0.5 mg/L
Iron	48.3 mg/L	10.6 mg/L
Manganese	17.1 mg/L	2.1 mg/L
Alkalinity	633 mg/L	996 mg/L
Escherichia Coli	25.6 CFU/100 mL	5.0 CFU/100 mL

6.3 Trigger Level Assessment

The first Tier of the TLP consists of regular monitoring as outlined in Table 3.1. The second Tier of the TLP will be implemented if during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location. The tabulated analytical results for the shallow unconfined aquifer and deep bedrock aquifers (Tables 4.2 and 4.3, respectively) include a comparison to the established trigger level concentrations.

Tier II confirmatory monitoring consists of collecting follow-up water quality samples in duplicate from the location(s) that exceed the Tier I trigger levels. The Tier II confirmatory monitoring will be carried-out during the next scheduled monitoring event. Tier I monitoring will resume following confirmatory samples below the Tier I trigger levels.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

Shallow Unconfined Aquifer Assessment

The following table summarizes the results of the shallow unconfined groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2018 Tier	Trigger Level Exceedances			2019 Tier
		May	**August**	**November**	
MW1-08	I	None	-	None	I
MW2-08	I	None	-	None	I
MW5-09	II	Ammonia	Ammonia	Ammonia	I
MW101-13	I	Ammonia	Ammonia	**Ammonia, E.Coli**	II
MW102-09	II	Ammonia	**Ammonia, Nitrate**	Ammonia	I
MW103-09	I	None	-	None	I
MW104-13	I	Ammonia	Ammonia	**Ammonia, Nitrate**	II
MW105-13	II	**Alkalinity, Ammonia**	Ammonia	Ammonia	I
MW106-15	I	Ammonia	Ammonia	Ammonia	I

As indicated in the above table, two parameters exceeded their respective trigger levels in samples collected from four wells during 2018. At MW102-09 and MW105-09, only single trigger exceedances persisted in subsequent sampling. Therefore, it is recommended that, in 2019, MW102-09 and MW105-09 be sampled following Tier I protocols and MW101-13 and MW104-13 be sampled in duplicate following the Tier II sampling protocol.

As discussed above, the Site initiated a program of groundwater remediation in 2016 in response to elevated ammonia concentrations in shallow groundwater near and downgradient of the facility. Operation of this system represents implementation of the contingency remedial response to observed groundwater quality impacts. Accordingly, future trigger level assessments should be undertaken for the purpose of tracking the evolution of groundwater quality as it relates to the remedial response, and should not necessarily be used for the purpose of triggering additional remedial response.

Deep Bedrock Aquifer

The following table summarizes the results of the deep bedrock groundwater TLP sampling undertaken during the current monitoring period:

Location ID	2018 Tier	Trigger Level Exceedances		2019 Tier
		May	November	
TW-7	I	None	None	I
TW-4	II	None	Ammonia, E.coli	II
TW-8	II	None	None	I

TW-4 and TW-8 were sampled following Tier II protocols in May 2018 and the trigger level exceedances observed in November 2017 samples were not present. Concentrations of ammonia and E.coli exceeded their respective deep bedrock Tier I trigger levels at TW-4 in the fall 2018 sample. Thus, it is recommended that that Tier II sampling be initiated at this location in the spring of 2019.

7. MECP Correspondence

During the fall of 2018 Renewi received three letters from the MECP with comments in relation to the 2016 and 2017 Groundwater and Surface Water Monitoring Reports (GHD, 2017 and GHD, 2018). Copies of these letters are included in Appendix B.

7.1 MECP Surface Water Comments

In a letter dated September 4, 2018 the MECP presented their review of the surface water monitoring portions of the 2016 and 2017 reports (GHD, 2017 and GHD, 2018). The letter describes the MECP's general concurrence with the interpretations and conclusions provided in the 2016 and 2017 Annual Monitoring Reports.

In addition, the letter provides a brief description of the available information related to grab sampling of pond discharge water by Golder Associates in April 2018. With respect to this sampling, the MECP indicates concurrence that the results of sampling do not constitute ECA non-compliance, as there is no requirement for sampling during discharge.

The MECP provides further concurrence with Renewi's statement that future exceedances of a trigger level within the SWMP during discharge should be addressed through the "Spill Contingency and Pollution Prevention Plan", required under Condition 5(6) of the ECA.

7.2 MECP Groundwater Comments

Renewi received two letters from the MECP dated November 13, 2018 and December 10, 2018 in relation to the 2016 and 2017 reports, respectively (GHD, 2017 and GHD, 2018). The following summarizes the comments provided on the 2016 Annual Monitoring Report:

- Pumping volumes from EW107-15 were insufficient during 2016 and 2017.
- The bedrock aquifer is showing signs of impact.
- Sampling confirms that groundwater was impaired due to elevated nitrate nitrogen levels above the ODQWS MAC of 10 mg/l at MW104-13 on August 16, 2016 and at MW105-13 on August 16, 2016, and November 15, 2016. Impairment of groundwater is a violation of the general provisions of the Ontario Water Resources Act.
- The extraction well must be operated more frequently to avoid further remedial measures and groundwater impairment as required by the Tier III Trigger Level Program.
- MECP reviewer was not in agreement with GHD that the existing single extraction well is the sole remedial measure that may be required to protect groundwater at this site.

In the December 10, 2018 letter the MECP reviewer commented on the 2017 report by noting that several trigger levels exceeded several times in the shallow aquifer and ongoing impact on deep groundwater.

GHD concurs with the MECP's position that groundwater extraction at EW107-15 should remove as much impacted groundwater from the subsurface as is practical. Once the extraction well is in stable operation, the effectiveness of the extraction well should be assessed and recommendations for continued or improved operation or expansion of the current remediation system should be made, as appropriate.

8. Conclusions

The following conclusions have been developed based on results of the groundwater and surface water monitoring and sampling activities conducted in 2018:

1. Based on the groundwater elevations gathered in May and November 2018, shallow unconfined aquifer flow occurs in an east-northeast direction and groundwater in the deep bedrock aquifer flows in a west-southwest direction, opposite to the direction of the shallow unconfined aquifer.
2. Analytical results for the shallow unconfined aquifer samples indicate that groundwater quality at the Site is being altered by Facility operations. The distribution of elevated concentrations of ammonia, DOC, iron, and manganese are consistent with a contaminant plume related to an organic contaminant source.
3. Analytical sample results obtained from the deep bedrock aquifer unit monitoring wells indicate that groundwater quality in the deep bedrock aquifer is naturally poor. Improvements in water quality at TW-8 have been observed during recent monitoring periods. There is currently insufficient data to confirm if the facility is the source of sporadic water quality within the deep bedrock aquifer.
4. Surface water sample results indicate that surface water quality downstream of the Site was unaltered by Site activities during the 2018 monitoring period.
5. Surface water was discharged twice from the on-Site Stormwater Management Pond during the 2018 monitoring period (April and late-June into July). All parameters were below their respective trigger levels listed in the Site ECA in samples collected from the Stormwater Management Pond prior to commencing discharging.

9. Recommendations

Based on the results of the water quality monitoring program conducted at the Facility, the following recommendations are presented:

1. The groundwater extraction system should be operated in such a manner that as much impacted groundwater from the shallow flow system is removed, as is practical.
2. If continued groundwater extraction cannot be accomplished with the current water demands of the facility, then consideration should be given to exploring alternatives for use, treatment or disposal of collected shallow groundwater.
3. The SCADA monitoring system should be used to accurately record the volume of water pumped.
4. Once the extraction well is in stable operation, the effectiveness of the extraction well should be assessed and recommendations for continued or improved operation or expansion, as appropriate, of the current remediation system should be made.
5. Tier II confirmatory sampling should be completed during the spring 2019 sampling event at MW101-13, MW104-13, and TW-4.
6. Proceed with replacement of existing ammonia scrubber with three new units.

Monitoring Program Schedule
2018 Groundwater and Surface Water Monitoring Report
Renewi Canada Ltd
5123 Hawthorne Road, Ottawa, Ontario

Notes:

(1)	General chemistry parameters - alkalinity, ammonia, DOC, nitrate, phosphorus turbidity, and un-ionized ammonia
(2)	Additional Surface Water General Chemistry parameters analyzed at SW-4 during monthly sampling - BOD, COD, TKN, nitrite, total phenols, TSS, oil & grease, pH, arsenic, boron, cadmium, chromium, cobalt, copper, lead, mercury, nickel, zinc
(3)	Metals - iron and manganese
(4)	Surface water metals are total while groundwater metals are dissolved.
(5)	5 Escherichia coli (e.coli)
(6)	SW-4 is sampled by CRA field staff on a bi-annual basis and monthly by Orgaworld staff (when it's safe to do so)
X	Samples to be collected tri-annually (spring, summer, and fall)
\	Samples to be collected semi-annually (spring and fall)

Groundwater Elevations
2018 Groundwater and Surface Water Monitoring Report
Renewi Canada Ltd.
5123 Hawthorne Road, Ottawa, ON

Location	Reference Elevation [1] [2] (m AMSL)	May 15-16, 2018		August 15 & 18, 2018		November 7-9, 2018	
		Depth to Water From Reference (m)	Groundwater Elevation (m AMSL)	Depth to Water From Reference (m)	Groundwater Elevation (m AMSL)	Depth to Water From Reference (m)	Groundwater Elevation (m AMSL)

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 2844-9YNGZC
Issue Date: February 1, 2017

Orgaworld Canada Ltd.
150 Kent Street
London, Ontario
N6A 1L3

Site Location: Source Separated Organics Processing Facility
5123 Hawthorne Road South
Part of West Half of Lot 27, Concession 6
City of Ottawa
K1G 3Y3

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

existing sewage works for the collection, transmission, treatment and disposal of stormwater runoff & process / wash water from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central stormwater management (SWM) facility off-site (i.e. at the adjacent Hawthorne Industrial Park) which subsequently discharges to the Findlay Creek through a roadside ditch, for all storm events up to and including the 100 year return storm, consisting of the following:

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.

- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.

- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters

below trigger levels.

Part I Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	**Elevation** (metre)	**Storage Volume** (cubic metres)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:

    - inlet structure: A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;

    - overflow channel: A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.

- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;

- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.

- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.

- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide

over 80% total net annual TSS removal, discharging to a forebay of the wet pond;

- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;

- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.

- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

Part II Process Water Recirculation System

- a **Process Water Recirculation System** (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:

- six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;

- four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;

- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.

- piping for percolate/washdown water supply to the composting area including a sprinkling system;

- an odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water

002677

and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned Works.

all in accordance with supporting documents listed in Schedule 'A'.

For the purpose of this environmental compliance approval, the following definitions apply:

"Application" means the application for an environmental compliance approval submitted to the Ministry for approval by or on behalf of the Owner and dated March 11, 2015;

"Approval" means this entire document and any schedules attached to it, and the Application;

"BOD_5"(also known as $TBOD_5$) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"$CBOD_5$"means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"COD" means Chemical Oxygen Demand;

"District Manager" means the District Manager of the Ottawa District Office of the Ministry;

"DOC" means Dissolved Organic Carbon;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for the purposes of Part II.1 of the EPA;

"*E. coli* " refers to the thermally tolerant forms of Escherichia that can survive at 44.5 degrees Celsius;

"EPA" means the *Environmental Protection Act, R.S.O. 1990, c.E.19* , as amended;

"Leachate Contaminated Sewage"means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Owner" means Orgaworld Canada Ltd., and its successors and assignees;

"OWRA" means the *Ontario Water Resources Act, R.S.O. 1990, c. O.40* , as amended;

"Substantial Completion" has the same meaning as "substantial performance" in the *Construction Lien Act* ; and

"Works" means the sewage works described in the Owner's application, and this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the terms and conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these terms and conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with this Approval.

(3) Where there is a conflict between a provision of this environmental compliance approval and any document submitted by the Owner, the conditions in this environmental compliance approval shall take precedence. Where there is a conflict between one or more of the documents submitted by the Owner, the Application shall take precedence unless it is clear that the purpose of the document was to amend the Application

(4) Where there is a conflict between the documents listed in the Schedule A, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The terms and conditions of this Approval are severable. If any term and condition of this environmental compliance approval, or the application of any requirement of this environmental compliance approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

(6) The issuance of, and compliance with the conditions of, this Approval does not:

(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement, including, but not limited to, the obligation

to obtain approval from the local conservation authority necessary to construct or operate the sewage Works; or

(b) limit in any way the authority of the Ministry to require certain steps be taken to require the Owner to furnish any further information related to compliance with this Approval.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of address of Owner or operating authority;

(b) change of Owner or operating authority or both, including address of new Owner or operating authority, or both;

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the *Business Names Act, R.S.O. 1990, c. B.17* ; and

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the "Initial Return" or "Notice of Change" filed under the *Corporations Information Act, R.S.O. 1990, c. C.39* , shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the Works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this condition refer to the number at the top of this environmental compliance approval.

3. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the Substantial Completion of the Works,a set of as-built drawings showing the Works as "constructed" shall be completed and submitted by the Owner to the District Manager.These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the Works or at operational office of the Owner for the operational life of the Works.

(2) The Owner shall inform in writing to the District Manager when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The Owner shall inform the District Manager of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

4. SURFACE WATER MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganic**	**Field Parameters**
BOD_5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen (TAN)	Chromium	Temperature
Total Kjeldahl Nitrogen (TKN)	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus (TP)	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after **two (2) years** of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The Owner shall retain for a minimum of **five (5) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

5. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(4) The Owner shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the Owner shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 4.(2). The Owner shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N	2.93
$CBOD_5$	15
Total Phosphorus (TP)	0.4
Total Suspended Solids (TSS)	15
E-coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the Owner shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 5.(2) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the Owner shall ensure that the contents of the SWM Pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner.

(8) The Owner shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to.

(9) Discharge of leachate contaminated sewage from the Works to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

(10) The Owner shall notify the District Manager orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The Owner shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation.

(13) The Owner shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or Owner's operational headquarters for inspection by the Ministry.The logbook shall include the following:

(a) the name of the Works;

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The Owner shall not store any end-product, including leaves and yard waste outdoors until the Owner prepares a Conditions Assessment and implementation plan approved by the District Manager. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

6. OPERATION AND MAINTENANCE

(1) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, including training in all procedures and other requirements of this Approval, the OWRA and regulations, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works;

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works;

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a **Spill Prevention Control and Countermeasures Plan**, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the District Manager; and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The Owner shall maintain the operations manual current and retain a copy at the location of the Works for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

PART IV - GENERAL

7. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the Works, the Owner shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall

include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the Owner.

9. GROUNDWATER MONITORING

Groundwater Monitoring Program

(1) The Owner shall, upon the issuance of this Approval, carry out the following groundwater monitoring program. Samples shall be collected from the specified groundwater monitoring wells at the frequency specified, by means of the specified sample type and analyzed for each parameter listed and all results recorded:

Table 3 - Groundwater Monitoring

Unconfined Shallow Aquifer

MW1-08*, MW2-08*, MW3-08*, MW4-09*, & MW103-09*.

MW5-09**, MW101-13**, MW102-09**, MW104-13**, MW105-13**, MW106-15** & EW107-15**.

Deep Bedrock Aquifer

TW-4*, TW-7* & TW-8*.

Frequency	*Semi Annual (i.e. two times in a year) ** Tri-Annual (i.e. three time in a year)
Sample Type	Grab
Parameters	Alkalinity, Total Ammonia Nitrogen, Dissolved Organic Carbon, *E-coli* , Iron, Manganese, Nitrate-N, and Total Phosphorous.

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (August 1994), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions; and

(c) in respect of any parameters not mentioned in (a) - (b), the written approval of the District Manager,which approval shall be obtained prior to sampling.

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after three (3) years of operation of the Works in accordance with this Condition, be modified by the Director in writing from time to time.

(4) The Owner shall compare analytical monitoring results obtained pursuant to Subsection (1) Table 3 - Groundwater Monitoring with the trigger level concentrations for the trigger parameter listed in Tables 4 and 5.

Table 4
Trigger Level Concentrations
Unconfined Shallow Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	633
Total Ammonia Nitrogen	4.0
Dissolved Organic Carbon	34.6
E-coli	25.6 CFU/100 mL
Iron	48.3
Manganese	17.1
Nitrate-N	1.3
Total Phosphorous	7.2

Table 5
Trigger Parameters
Deep Bedrock Aquifer

Parameter	Trigger Level (milligram per litre if not specified)
Alkalinity	996
Total Ammonia Nitrogen	0.2
Dissolved Organic Carbon	18.4
E-coli	5.0 CFU/100 mL
Iron	10.6
Manganese	2.1
Nitrate-N	0.5
Total Phosphorous	0.5

(5) The trigger level program shall be implemented using the following three (3) Tiers to verify the results and direct potential contingency implementation:

Tier I (Routine Monitoring Program)

Tier I Routine Monitoring Program (RMP) involves the sampling of all on-site groundwater monitoring wells at the frequency specified in Table 3. All groundwater monitoring activities completed at the site will be considered Tier I RMP unless two (2) or more trigger parameters exceed there respective trigger levels in a simple sample.

Tier II (Confirmation Monitoring Program)

If during a single monitoring event, two (2) or more trigger parameters exceed the established (see Tables 4 and 5) Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring Program (CMP) shall be implemented.

The Tier II CMP consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next schedule monitoring event in order to confirm the Tier I exceedance of the two (2) or more trigger parameters.

If the concentrations reported in the duplicate sample return to below their respective trigger levels, then Tier I RMP will resume.

If the Tier I exceedance is confirmed, then the next step shall be a re-evaluation of the degree, nature, and potential source(s) of the trigger level impact(s) identified in Tier I including the implication of the exceedance in terms of the potential for impacts to down-gradient off-site water users.

If the Tier II CMP and the subsequent evaluation indicate that the facility operations are having a detrimental effect on water quality migrating off-site, then Tier III Contingency Measures and Compliance Monitoring Program shall be implemented.

Tier III (Contingency Measures and Compliance Monitoring Program)

Tier III Contingency Measures and Compliance Monitoring Program (CMCMP) involves assessment and implementation of contingency measures in the event of imminent off-site groundwater quality impairment.

Contingency measures to be evaluated should include extraction of impacted groundwater and/or surface water for on-site treatment or off-site disposal, or acquisition of groundwater rights and registration of a contaminated attenuation zone (CAZ) on title of adjacent lands.

Tier III CMCMP should also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented.

The Tier III CMCMP details should be determined in conjunction with the development and implementation of preferred contingency measure(s).

The compliance monitoring parameters, locations, and monitoring frequency should be determined at the time of implementation of contingency measures.

Lastly, appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed.

(6) The Owner shall notify the District Manager orally, as soon as possible, and in writing within

seven (7) days in the event a trigger exceedance occurs.

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

10. REPORTING

(1) The Owner shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to Ministry staff.

(2) The Owner shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the Works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the Works;

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the District Manager requires from time to time.

SCHEDULE 'A'

1. Environmental Compliance Approval Application for Industrial Sewage Works submitted by Ben Constable, Conestoga-Rovers & Associates (CRA), and signed by Mike Rooke, Compliance Officer, Orgaworld Canada Ltd., dated March 11, 2015, and all supporting documentation and information.

2. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

3. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

4. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

5. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

6. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

7. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

8. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

9. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

10. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

11. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla,

P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

12. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

13. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

14. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

15. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

16. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. Condition 1.(6) is included to emphasize that the issuance of this Approval does not diminish any other statutory and regulatory obligations to which the Owner is subject in the construction, maintenance and operation of the Works. The condition specifically highlights the need to obtain any necessary conservation authority approvals. The condition also emphasizes the fact that this Approval doesn't limit the authority of the Ministry to require further information.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved Works and to ensure that subsequent owners of the Works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is included to ensure that the Works are constructed in accordance with the approval and that record drawings of the Works"as constructed" are maintained for future references.

4. Conditions 4 and 8 are included to enable the Owner to evaluate and demonstrate the performance of the Works,on a continual basis, so that the Works are properly operated and maintained at a level which is consistent with the design objectives specified in the Approval and that the Works does not cause any impairment to the receiving watercourse.

5. Conditions 5, 6 and 7 are included to require that the Works be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the Ministry.

6. Condition 9 is included to provide a performance record for future references, to ensure that the Ministry is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this Approval, so that the Ministry can work with the Owner in resolving any problems in a timely manner.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 7251-8GKRPD issued on May 30, 2011.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

1. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The environmental compliance approval number;
6. The date of the environmental compliance approval;
7. The name of the Director, and;
8. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment and Climate Change
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 314-4506 or www.ert.gov.on.ca**

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 1st day of February, 2017

Fariha Pannu.

Fariha Pannu, P.Eng.
Director
appointed for the purposes of Part II.1 of the
Environmental Protection Act

AA/
c: District Manager, MOECC Ottawa District Office
Ben Constable, Conestoga-Rovers & Associates (CRA)

Ministry of the Environment
Ministère de l'Environnement

AMENDED CERTIFICATE OF APPROVAL
INDUSTRIAL SEWAGE WORKS
NUMBER 7251-8GKRPD
Issue Date: May 30, 2011

Orgaworld Canada Ltd.
4675 Wellington Rd S
London, Ontario
N6K 0C7

Site Location: 5123 Hawthorne Road South
Lot Part of West Half of 27, Concession 6
Ottawa City,
K1G 3Y3

You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

the establishment of stormwater management *Works* for the collection, transmission, treatment and disposal of stormwater runoff and process/wash sewage from a catchment area of 10.14 hectares, to provide Normal water quality protection (Level 2) and to attenuate post-development peak flows to pre-development levels, discharging to a roadside ditch, then to a central SWM facility off site (adjacent Hawthorne Industrial Park), and subsequently discharging through a ditch to Findlay Creek, for all storm events up to and including the 100 year return storm, consisting of the following:

PROPOSED WORKS

- one (1) submersible pump capable of pumping up to 229 m^3/day of stormwater collected from the south ditch of the Site. The pumped stormwater is transferred via a sub-surface 50 mm PVC forcemain to underground storage tanks located on the east side of the Facility for integration into the process water stream or transported off-site for final treatment.
- one (1) terrain tank located on the north side of the Facility, adjacent to the north ditch, having an approximate volume of 45 m^3. Initial stormwater run-off will drain from a portion of the asphalt pad on the north side of the Facility into the tank for assessment by site operations staff as to disposal point (ditch/pond, into plant, or hauled off-site). As the tank fills, tank will spill-over (after initial flush) into the north ditch and travel to the wet detention pond.
- installation of aerators in the south-east portions of the wet detention pond to be operated as required, in order to maintain the stormwater management pond water quality trigger parameters below trigger levels.

EXISTING WORKS

Part 1 Stormwater Management Works

- one (1) wet extended detention stormwater pond in U shape with approximately base dimensions as follows: 120 m long and 12 m wide, and a maximum depth of 2.0 m, to permanent pool level and 3.4 m to overflow weir elevation (emergency elevation), with 4:1 side slopes, with the following volume structure:

Stage Storage	Elevation (m)	Storage Volume (m^3)
Permanent Pool	90.25 – 91.25	5,385
Extended Detention	91.25 – 91.45	1,311
Quantity	91.45 – 92.25	6,080
Emergency	92.25 – 92.65	3,532

and equipped with the following structures:

- one (1) forebay approximately 65 m long and 12 m wide in U shape, and a maximum depth of 1.0 m to permanent pool level and 3.4 m to overflow weir elevation, equipped with two inlet structures:
    1. Inlet structure. A 12.5 m long 900 mm diameter concrete storm inlet pipe with concrete headwall, connected through the Vortechs unit before entering the sedimentation forebay at an invert elevation of 89.60 m, designed to convey up to a maximum 714 L/s;
    2. Overflow channel. A 9.0 m wide (base), 1.5 m long and approximately 250 mm high channel connecting the open ditch system to the forebay at an invert elevation of 92.45 m, designed to convey up to a maximum 3.07 m^3/sec.
- one (1) 150 mm diameter orifice plate set at an elevation of 91.25 m for quality control. This flow restrictor is installed within a 2400 mm diameter maintenance hole (MH2) and attached at the downstream end of a 300 mm diameter PVC pipe, equipped with a cast iron sluice gate valve (Armtec series 20-10C), which will be in **closed position** during normal operation periods;
- one (1) 825 mm diameter concrete pipe and 3.8 m length for quantity control up to the 100-year post-development flow set at an elevation of 91.45 m.
- one (1) 4.0 m wide 250 mm high emergency overflow spillway set at an elevation of 92.25 m, discharging to a concrete stabilized swale and ultimately the roadside dith draining to the Findlay Creek, a tributary to Shields Creek.
- one (1) precast concrete oil/grit separator (Vortechs Model 16000) designed to handle stormwater runoff to convey up to 714 L/s storm flows, providing a sediment storage capacity of 5.43 m^3 and having interior dimensions of 5.49 m long, 3.66 m widen and 2.13 m high, designed to provide over 80% total net annual TSS removal, discharging to a forebay of the wet pond;
- an open ditch/swale system with sufficient capacity to convey up to the 100-year storm event (estimated at 3.07 m^3/sec), with approximately 1,000 m length of a trapezoidal shaped perimeter ditch along the site boundaries, having a top width of approximately 1.0 m wide flat bottom ditch and side slopes of 3V:1H up to 10:1 with variable widths and depths, running through three culverts of 18 to 30 m in length and 600 mm diameter concrete sewers, and discharging through a 2400 mm diameter maintenance hole (MH1) connecting to the oil/grit separator described above;
- a minor drainage system of storm sewers and appurtances designed to capture and convey runoff during frequent storm events up to the 10-year storm event with PVC sewers ranging from 150 mm to 300 mm diameter sewers. The minor drainage system connects the organics composting facility through approximately 200 m length 300 mm diameter sewer to the MH5 for further discharge into the inlet structures.
- one (1) maintenance access road for operational, inspection and maintenance purposes, consisting of a 4 m wide gravel/grassed access lane located around the perimeter of the facility and a 70 m long gravel lane to the inlet structures at the northwest corner of the pond to the outlet structures.

The simulated modelling estimate and drainage pattern of the site are as follows:

Storm Events	**2-year**	**5-year**	**25-year**	**100-year**
Existing flows, pre-development (L/s)	206	351	606	848
Post-development flows (L/s)	1,118	1,651	2,410	3,067
Post-development attenuated flows (L/s)	56	89	189	283

The above, including erosion/sedimentation control measures during construction and all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

Part II <u>Process Water Recirculation System</u>

- A Process Water Recirculation System (WRS) to provide optimum humidity levels for the composting process and for odour control system, consisting of the following:
- Six (6) reinforced precast concrete underground storage tanks equipped with level control system with a capacity of 45 m^3 each;
- Four (4) plastic above ground storage tanks (bioscrubber, sulphuric acid storage, tank and two ammonium sulphate storage tanks) equipped with level control system with a capacity of 180, 45, 50, and 50 m^3 respectively;
- Eight (8) pumps to recirculate collected water from composting tunnels, biofilters and bioscrubber to the composting tunnels, biofilter and bioscrubber and for washdown supply.
- Piping for percolate/washdown water supply to the composting area including a sprinkling system;
- An odour control equipment consisting of a biofilters and bio scrubber to recirculate filtrate water and supply of filtered effluent to the washdown lines, and equipped with chemical addition piping for pH control; and

- Piping for the supply of stormwater from the wet pond to the process tanks for composting requirements.

The above, including all other controls and appurtenances essential for the proper operation of the aforementioned *Works*.

All in accordance with the following submitted supporting documents:

1. Application for Approval of Industrial Sewage Works submitted by Frederick (Rick) Mosher of Orgaworld Canada Ltd., dated September 19, 2008, with supporting information prepared by J.L. Richards & Associates Limited of Ottawa.

2. Stormwater Site Management Plan, Orgaworld Ottawa Composting Facility, dated September 2008, prepared by Mark Buchanan, EIT, Derrick Upton, P.Eng., Guy Forget, P.Eng., from J.L. Richards and Associates Limited; and Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates.

3. Hydrological Investigation, Terrain Analysis and Impact Assessment, Proposed Industrial Subdivision Report. Lots 26 & 27 Concession VI, Geographic City of Gloucester, City of Ottawa, Ontario, dated December 2008, and prepared by Golder Associates.

4. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, and received on March 9, 2009, with response to MOE letter of information request dated February 4, 2009.

5. Application for a Provisional Certificate of Approval for Waste Disposal Site - Organics Composting Facility - Orgaworld Canada Ltd., dated June 2008, prepared by Conestoga-Rovers and Associates of Waterloo.

6. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated February 17, 2009, with response to MOE letter dated February 2, 2009.

7. Email from Tej Gidda, P. Eng., Ph. D., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated March 21, 2009, in agreement with Spill Contingency and Pollution Prevention Plan.

8. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated April 9, 2009, with response to MOE letter dated March 25, 2009.

9. Letter from Jennifer L. Boyer, M.Sc., B.E.S., of South Nation Consercation to Mike Schmidt of the City of Ottawa, dated May 26, 2009, with final review of the SWM Report for the Tomilson/Hawthorne Industrial Park subdivision.

10. Letter from Ron Cherkewski, P.Eng. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 1, 2009, with response to MOE letter dated May 11, 2009.

11. Letter from Francois La Forge, P.Eng., of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated June 30, 2009, with the proposed Groundwater/Surface Water Monitoring Program.

12. Letters from Tej Gidda, P. Eng., Ph. D. of Conestoga-Rovers & Associates to Edgardo Tovilla, P.Eng. of the MOE, dated July 17, 20 & 23, and August 21, 2009, with response to information requested on June 8, 2009, and final revisions to the Draft CofA.

13. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 23, 2010, with supporting information prepared by Conestoga Rovers & Associates of Waterloo.

14. Meeting minutes prepared by Conestoga Rovers & Associated, dated August 23, 2010, after meeting with the Ottawa District Office and MOE Technical Support.

15. Application for Approval of Industrial Sewage Works submitted by Henk Kaskens of Orgaworld Canada Ltd., dated March 18, 2010, with supporting information prepared by Conestoga-Rovers & Associates of Waterloo.

CONTENT COPY OF ORIGINAL

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"*Act*" means the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, as amended;

"*BOD5*" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"*CBOD5*" means five day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in an unfiltered sample;

"*Certificate*" means this entire certificate of approval document, issued in accordance with Section 53 of the *Act*, and includes any schedules;

"*COD*" means Chemical Oxygen Demand;

"*Director*" means any *Ministry* employee appointed by the Minister pursuant to section 5 of the *Act*;

"*District Manager*" means the District Manager of the Ottawa District Office of the Ministry;

"*DOC*" means Dissolved Organic Carbon;

"*Leachate Contaminated Sewage*" means sewage collected on site that exceeds any of the the trigger parameter levels for a water quality listed in Table 2;

"*Ministry*" means the Ontario Ministry of the Environment;

"*Owner*" means Orgaworld Canada Ltd., also referred as OCL, and includes its successors and assignees;

"*Substantial Completion*" has the same meaning as "*substantial performance*" in the Construction Lien Act; and

"*Works*" means the sewage works described in the *Owner's* application, this *Certificate* and in the supporting documentation referred to herein, to the extent approved by this *Certificate.*

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PART I - GENERAL

1. GENERAL PROVISIONS

(1) The *Owner* shall ensure that any person authorized to carry out work on or operate any aspect of the *Works* is notified of this *Certificate* and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these Conditions, the *Owner* shall design, build, install, operate and maintain the *Works* in accordance with the description given in this *Certificate* the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this *Certificate.*

(3) Where there is a conflict between a provision of any submitted document referred to in this *Certificate* and the Conditions of this *Certificate*, the Conditions in this *Certificate* shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the listed submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The requirements of this *Certificate* are severable. If any requirement of this *Certificate*, or the application of any

requirement of this *Certificate* to any circumstance, is held invalid or unenforceable, the application of such requirement to other circumstances and the remainder of this certificate shall not be affected thereby.

2. EXPIRY OF APPROVAL

The approval issued by this *Certificate* will cease to apply to those parts of the *Works* which have not been constructed within **five (5) years** of the date of this *Certificate.*

3. CHANGE OF OWNER

(1) The *Owner* shall notify the *District Manager* and the *Director*, in writing, of any of the following changes within **thirty (30) days** of the change occurring:

(a) change of *Owner;*

(b) change of address of the *Owner;*

(c) change of partners where the *Owner* is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Business Names Act, R.S.O. 1990, c.B17 shall be included in the notification to the *District Manager;*

(d) change of name of the corporation where the *Owner* is or at any time becomes a corporation, and a copy of the most current information filed under the Corporations Information Act, R.S.O. 1990, c. C39 shall be included in the notification to the *District Manager;*

(2) In the event of any change in ownership of the *Works*, other than a change to a successor municipality, the *Owner* shall notify in writing the succeeding owner of the existence of this *Certificate*, and a copy of such notice shall be forwarded to the *District Manager* and the *Director.*

4. UPON THE SUBSTANTIAL COMPLETION OF THE WORKS

(1) Within **one (1) year** of the *Substantial Completion* of the *Works*, a set of as-built drawings showing the *Works* as "constructed" shall be completed and submitted by the *Owner* to the *District Manager.* These drawings shall be kept up to date through revisions undertaken from time to time and a copy shall be retained at the *Works* or at operational office of the *Owner* for the operational life of the *Works.*

(2) The *Owner* shall inform in writing to the *District Manager* when sewage from the site is transported by a licensed waste hauler for further treatment at a sewage treatment plant or to any disposal site. The *Owner* shall inform the *District Manager* of any other alternative measures for further treatment, management and disposal of sewage.

PART II - STORMWATER MANAGEMENT WORKS

5. SURFACE WATER MONITORING AND RECORDING

(1) The *Owner* shall, upon commencement of operation of the *Works*, carry out the following effluent monitoring program. Composite samples comprised of three (3) or more equal volumes of grab samples from different locations of the pond shall be collected from the **SWM Pond at a monthly frequency** and analyzed for the following parameters listed in Table 1:

Table 1 - Effluent Monitoring SWM Pond		
General Parameters	**Inorganics**	**Field Parameters**
BOD5	Arsenic	Conductivity
COD	Boron	Dissolved Oxygen
DOC	Cadmium	pH
Total Ammonia Nitrogen	Chromium	Temperature
Total Kjeldahl Nitrogen	Cobalt	
Nitrate-N	Copper	
Nitrite-N	Lead	
Total Phenols	Mercury	
Total Phosphorus	Nickel	
Total Suspended Solids (TSS)	Zinc	
E-Coli		
Oil & Grease		
pH		

(2) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's Procedure F-10-1, "Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works (Liquid Waste Streams Only), as amended from time to time by more recently published editions;

(b) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (January 1999), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;

(c) the publication "Standard Methods for the Examination of Water and Wastewater" (20th edition), as amended from time to time by more recently published editions;

(3) The list of parameters and monitoring frequencies specified in subsection (1) of this Condition in respect to any parameter are minimum requirements which may, after two (2) years of operation of the *Works* in accordance with this Condition, be modified by the *District Manager* in writing from time to time.

(4) The Owner shall establish four (4) surface water stations named SW-1, SW-2, SW-3, and SW-4 as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates, and implement a long-term monitoring program for the surface water quality of Findlay Creek.

(5) The *Owner* shall retain for a minimum of **three (3) years** from the date of their creation, all records and information related to or resulting from the monitoring activities required by this *Certificate*.

6. OPERATION AND MAINTENANCE

(1) Up on commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* prepared in accordance with Condition (8) is submitted to the *District Manager* for comments and concurrance;

(2) Upon commencement of operation of the *Works*, the *Owner* shall implement all operating procedures identified in the operations manual. This manual shall include, but not necessarily be limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

CONTENT COPY OF ORIGINAL

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

(4) The *Owner* shall keep the **SWM Pond** discharge outlet sluice gate valve in **closed position** during normal operation periods.

(5) Prior to any discharge from the **SWM Pond** to the natural environment, the *Owner* shall collect grab samples from a designated sampling location at the **SWM Pond** and analyze for the parameters listed in Table 2 using the analytical protocols listed in Condition 5(2). The *Owner* shall compare monitoring results for each and all grab samples with the corresponding trigger level of each parameter listed in Table 2 to identify any leachate contamination of stormwater **before allowing any discharge from the SWM Pond.**

Table 2
Trigger Parameters

Parameter	**Trigger Level** (mg/L if not specified)
Ammonia (unionized)	0.05
Nitrate-N (NO3-N)	2.93
CBOD5	15
Total Phosphorus	0.4
Total Suspended Solids	15
E-Coli	100 count/100 mL
pH	6.5 to 8.5
Temperature (maximum)	23°C

(6) In the event of an exceedance of a trigger level for any trigger parameter, the *Owner* shall implement the "Spill Contingency and Pollution Prevention Plan" approved under Condition 6 (1) and identify the cause of contamination and implement remedial measures to prevent storm sewage being contaminated with leachate.

(7) After the implementation of remedial measures, the *Owner*shall ensure that the contents of the SWM pond which is still deemed to be leachate contaminated sewage is disposed of in a pre-approved manner;

(8) The *Owner*shall generate a record for each instance when leachate contaminated sewage is hauled off-site for further treatment and include in this record the date, quantity of leachate contaminated sewage, and location where it has been hauled to;

(9) Discharge of leachate contaminated sewage from the *Works*to receiving surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage;

CONTENT COPY OF ORIGINAL

(10) The *Owner* shall notify the *District Manager* orally, as soon as possible, and in writing within **seven (7) days** of the discharge to receiving surface water of leachate contaminated sewage. This reporting shall include but not be limited to:

(a) an assessment of the impacts – real and potential – relating to each discharge;

(b) the cause(s) of or the conditions leading to the discharge event;

(c) the analytical results of each grab sample taken prior to and during the discharge event and its comparison with the trigger parameters listed in Table 2;

(d) the estimated volume of leachate contaminated sewage discharged; and

(e) the proposed and/or completed remedial actions.

(11) The *Owner* shall maintain the water level in the detention pond at a level that ensures adequate storage is available for stormwater runoff associated with major storm events by ensuring that detained stormwater is disposed of in a timely manner to minimize the occurrence of emergency overflow during major storm events.

(12) The *Owner* shall inspect the *Works* at least once a year and, if necessary, clean and maintain the *Works* to prevent the excessive build-up of sediments and/or vegetation.

(13) The *Owner* shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook at the site and/or *Owner's* operational headquarters for inspection by the *Ministry*. The logbook shall include the following:

(a) the name of the *Works;*

(b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed;

(c) the volume of contaminated stormwater disposed off-site, the date, and the name of the receiving sewage treatment plant; and

(d) the sample monitoring results (Table 1 parameters).

(14) The *Owner* shall not store any end-product, including leaves and yard waste outdoors until the *Owner* prepares a Conditions Assessment and implementation plan approved by the *District Manager*. This Assessment and implementation plan shall include at a minimum:

(a) providing crib-bin walls or equivalent for the outdoor covered shelter structure to prevent contact between finished compost and wind-driven moisture;

(b) design of a monitoring plan with sample locations, frequency, sample type and parameters; and

(c) identification of trigger parameters and corrective actions in case of consistently exceeding these parameters.

PART III - PROCESS WATER RECIRCULATION SYSTEM

7. OPERATION AND MAINTENANCE

(1) Before the commencement of operation of the *Works*, the *Owner* shall ensure that a "Spill Contingency and Pollution Prevention Plan" for the *Works* is prepared as per Condition (8), submitted to the *District Manager;*

(2) Up on commencement of operation of the *Works*, the *Owner* shall implement all operational procedures identified in the operation manual. The operation manual shall include, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the *Works;*

(b) inspection programs, including frequency of inspection, for the *Works* and the methods or tests

CONTENT COPY OF ORIGINAL

employed to detect when maintenance is necessary;

(c) repair and maintenance programs, including the frequency of repair and maintenance for the *Works;*

(d) procedures for the inspection and calibration of monitoring equipment;

(e) a spill prevention control and countermeasures plan, consisting of contingency plans and procedures for dealing with equipment breakdowns, potential spills and any other abnormal situations, including notification of the *District Manager;*and

(f) procedures for receiving, responding and recording public complaints, including recording any follow-up actions taken.

(3) The *Owner*shall maintain the operations manual current and retain a copy at the location of the *Works*for the operational life of the *Works.*Upon request, the *Owner*shall make the manual available to *Ministry*staff.

PART IV - GENERAL

8. SPILL CONTINGENCY AND POLLUTION PREVENTION PLAN

(1) Upon commencement of operation of the *Works,*the *Owner*shall implement a Spill Contingency and Pollution Prevention Plan that outlines procedures as to how to mitigate the impacts of a spill within the area serviced by the works and/or prevent pollution incidents. The said plan shall include as a minimum, but not limited to:

(a) the name, job title and location (address) of the owner, person in charge, management or control of the facility;

(b) the name, job title and 24-hour telephone number of the person(s) responsible for activating the spill contingency plan;

(c) a site plan drawn to scale showing the facility, nearby buildings, streets, catchbasins & manholes, drainage patterns (including direction(s) of flow in storm sewers) and any features which need to be taken into account in terms of potential impacts on access and response (including physical obstructions and location of response and clean-up equipment);

(d) steps to be taken to report, contain, clean up and dispose of contaminants following a spill;

(e) a listing of telephone numbers for: local clean-up company(ies) who may be called upon to assist in responding to spills; local emergency responders including health institution(s); and MOE Spills Action Centre 1-800-268-6060;

(f) Materials Safety Data Sheets (MSDS) for each hazardous material which may be transported or stored within the area serviced by the works;

(g) the means (internal corporate procedures) by which the spill contingency plan is activated;

(h) a description of the spill response and pollution prevention training provided to employees assigned to work in the area serviced by the works, the date(s) on which the training was provided and to whom;

(i) an inventory of response and clean-up equipment available to implement the spill contingency plan, location and, date of maintenance/replacement if warranted; and

(j) the date on which the contingency and pollution prevention plan was prepared and subsequently, amended.

(2) The Spill Contingency and Pollution Prevention Plan shall be kept in a conspicuous place inside the building and in the close vicinity of the truck loading/unloading area.

(3) The Spill Contingency and Pollution Prevention Plan will be amended from time to time as needed by changes in the

CONTENT COPY OF ORIGINAL

operation of the facility or to reflect the City of Ottawa's municipal By-Laws updates or improved Best Management Practices by the *Owner*.

9. GROUNDWATER MONITORING

Upon issuance of this *Certificate*, the *Owner* shall establish the following groundwater monitoring program with monitoring wells located as per Figure 1 - Shallow Unconfined Water Table Groundwater and Surface Water Monitoring Locations, dated June 30, 2009, prepared by Conestoga-Rovers Associates.

(1) For the unconfined shallow groundwater aquifer, the *Owner* shall establish and maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing eight (8) monitoring wells designated as: MW1-08 to MW5-08; and MW101 to MW103 and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(2) For the confined deep bedrock aquifer, the *Owner* shall maintain in accordance with O.Reg. 903, R.R.O. 1990, as amended from time to time, all existing three (3) monitoring wells designated as: TW-4, TW-7, and TW-8 (within the Orgaworld Canada Ltd. site), and such wells that would be necessary for the appropriate monitoring of the groundwater quality.

(3) Within **sixty (60) days** of the issuance of this Certificate, the *Owner* shall:

(a) complete an assessment of the groundwater quality for each stratrigraphic unit:

(b) develop criteria in accordance with the Ministry Guideline B-7 - Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities; and

(c) submit to the *District Manager* for review and concurrence.

(4) The *Owner* shall collect groundwater samples twice per year - in May and November - from the monitoring wells listed at subsections (1) and (2), and increase the sampling frequency to four times per year - in February, May, August and November - for the three new wells MW101, MW102, and MW103.

(5) The Owner shall have the samples collected pursuant to subsection (2) filtered and analyzed for Alkalinity, Colour, Iron, Manganese, Cadmium, Molybdenum, Zinc, Petroleum Hydrocarbons fractions, Anthracene, arsenic, E.Coli, feacal coliforms, total coliforms, Total Disssolved Solids (TDS), DOC, turbidity, pH, CBOD5, temperature, using the analytical protocols listed at Condition 5 (2).

(6) The Owner shall measure the water level elevation in each of the monitoring wells identified in subsection (1) and (2) at the time of collection of water samples pursuant to subsections (4).

(7) The measurement frequencies specified in subsection (4) in respect of any parameter are minimum requirements which may, after **two (2) years** of operation of the Works, be modified by the *District Manager* in writing from time to time.

(8) After **two (2) years** of operation of the *Works*, the *Owner* shall establish a comprehensive Compliance and Trigger Level Monitoring Program based on the groundwater monitoring, and submit it along with an application to amend this *Certificate* to the *Director* and the *District Manager*.

10. REPORTING

(1) **One (1) week** prior to the start up of the operation of the *Works*, the *Owner* shall notify the *District Manager* (in writing) of the pending start up date.

(2) The *Owner* shall, upon request, make all manuals, plans, records, data, procedures and supporting documentation available to *Ministry* staff.

(3) The *Owner* shall prepare a performance report on an annual basis, within **ninety (90) days** following the end of the

period being reported upon. The first such report shall cover the first annual period following the commencement of operation of the *Works* and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a description of any operating problems encountered and corrective actions taken;

(b) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the *Works;*

(c) a summary of all effluent monitoring results undertaken in the reporting period;

(d) a summary of the quantity of leachate contaminated sewage that was hauled to a municipal sewage treatment plant and the number of times the contents of the SWM Pond were disposed in such manner;

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment;

(f) all analytical results and water level elevations obtained from the groundwater monitoring, pursuant to condition 9; and

(e) any other information the *District Manager* requires from time to time.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the *Works* are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the *Certificate* and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review. The condition also advises the Owners their responsibility to notify any person they authorized to carry out work pursuant to this *Certificate* the existence of this *Certificate.*

2. Condition 2 is included to ensure that, when the *Works* are constructed, the *Works* will meet the standards that apply at the time of construction to ensure the ongoing protection of the environment.

3. Condition 3 is included to ensure that the *Ministry* records are kept accurate and current with respect to the approved works and to ensure that subsequent owners of the *Works* are made aware of the *Certificate* and continue to operate the *Works* in compliance with it.

4. Condition 4 is included to ensure that the *Works* are constructed in accordance with the approval and that record drawings of the *Works* "as constructed" are maintained for future references.

5. Conditions 5 and 9 are included to enable the *Owner* to evaluate and demonstrate the performance of the *Works,* on a continual basis, so that the *Works* are properly operated and maintained at a level which is consistent with the design objectives specified in the *Certificate* and that the *Works* does not cause any impairment to the receiving watercourse.

6. Conditions 6, 7 and 8 are included to require that the *Works* be properly operated, maintained, funded, staffed and equipped such that the environment is protected and deterioration, loss, injury or damage to any person or property is prevented. As well, the inclusion of a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the owner and made available to the *Ministry.*

7. Condition 10 is included to provide a performance record for future references, to ensure that the *Ministry* is made aware of problems as they arise, and to provide a compliance record for all the terms and conditions outlined in this *Certificate,* so that the *Ministry* can work with the *Owner* in resolving any problems in a timely manner.

This Certificate of Approval revokes and replaces Certificate(s) of Approval No. 7032-88XPRA issued on September 7, 2010.

written notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 101 of the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

1. The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Certificate of Approval number;
6. The date of the Certificate of Approval;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/28	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Recommended Compliance and Trigger Level Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline a recommended groundwater Compliance and Trigger Level Program (TLP) for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Facility) located at the 5123 Hawthorne Road, Ottawa, Ontario (Site). The TLP has been developed to satisfy Condition 9(8) of the Environmental Compliance Approval (Industrial Sewage Works No. 7251-8GKRPD) (ECA) for the Site and is being submitted in support of an application to amend the ECA. The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

The following Section discusses the results of previous assessments of groundwater compliance and trigger level assessments for the Site. A recommended TLP for the Site is presented in Section 3.0.

2.0 Background

The OCL Site is approximately 10 hectares in area and is situated in the southwest corner of the Hawthorne Industrial Park (HIP) subdivision, which covers an area of approximately 80 hectares. Since the early/mid 1990's, the HIP subdivision has historically received excess fill materials from various construction and demolition projects, which is understood to consist primarily of clean soil with some concrete debris and reclaimed asphalt pavement and aggregate materials, and has also been intermittently used for temporary storage of various construction related materials. The area surrounding the HIP subdivision has a number of mineral aggregate extraction operations in place (south-east, west, and north-west of HIP), some of which are still active. The OCL Site was also subject to mineral aggregate removals prior to Facility development by OCL. Given the historic and ongoing land uses around the subject Site, there is the potential for soil, groundwater, and surface water quality impairment related to the various past activities.

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

As part of the ECA development for this Site, the MOE requested a groundwater monitoring program be implemented to ensure that the proposed operation of the OCL Facility does not adversely affect the surrounding environment (there are concerns for downstream agricultural users of the shallow/surface water regime, and for the deeper-aquifer which supplies potable water to a number of nearby properties). The purpose of the groundwater monitoring program is to evaluate the potential impact of OCL activities on the groundwater and surface water quality; regular monitoring allows for the analysis of trends over time and ensures there is an early warning of potential problems.

Previous assessments of groundwater quality at the Site have identified pre-existing groundwater quality as an obstacle to developing a functional TLP for groundwater in the current Site context. Historical backfill material used on Site, as well as historical and surrounding land uses have resulted in highly variable groundwater quality. For this reason, typical assessments using generic water quality standards as the basis for assessing compliance at the Site boundary do not provide meaningful indications of the effects of Facility operations on groundwater quality.

Condition 9(3b) of the ECA requires the development of criteria in accordance with MOE Guideline B-7 (Incorporation of the Reasonable Use Concept into MOEE Groundwater Management Activities). CRA initially completed an assessment of on-Site water quality in accordance with the Reasonable Use Concept in a memo to Tracy Hart of the MOE dated February 5, 2010. Assessments of water quality provided in Annual Monitoring Reports following submission of the February 5, 2010 memo concluded that the application of the Reasonable Use Concept at the downgradient property boundary is irrelevant due to the presence of numerous parameters elevated above generic standards in background water quality. As such, the Site-specific criteria calculated using the Reasonable Use Concept are not considered appropriate for evaluating Site compliance.

A groundwater trigger level assessment that used intra-well baseline data was provided in the 2012 Annual Monitoring Report for the Site. This type of assessment can be useful for identifying potential increases in groundwater quality impacts by comparing current data to statistically-based upper tolerance limits (UTLs) developed from historical data at individual wells. However, the use of trigger levels based on intra-well baseline UTLs is not considered appropriate for the Site for the following reasons:

1. There is insufficient pre-start-up data to provide statistically valid intra-well baseline data.
2. The intra-well baseline method does not account for the movement of pre-start-up water quality impacts from one portion of the Site to another. Based on the highly variable water quality on-Site prior to start-up of Facility operations, this could yield false triggers in downgradient on-Site monitoring wells.

3.0 Recommended Compliance and Trigger Level Program

For the purposes of assessing potential groundwater quality impairments related to the activities approved under the ECA, comparison of post-start-up data to pre-start-up data provides a useful comparison. Water quality data from pre-start-up monitoring demonstrated considerable variability within the shallow unconfined aquifer across the Site. This pattern is consistent with variable pre-existing sources of water

quality impacts upgradient and/or on-Site. Some sources of water quality impacts un-related to the Facility operations include: current and historical quarrying operations located upgradient of the Site, historical backfill materials used for grading at the Site, and various other current and historical industrial and agricultural activities in the vicinity.

Therefore, in consideration of the variable water quality pre-existing Facility operations, it is recommended that the aggregate Site-wide pre-start-up water quality data be used as the basis for establishing groundwater trigger levels for the shallow unconfined aquifer. The pre-start-up data is all data collected from shallow unconfined aquifer monitoring wells between July 2008 and January 2010. By using an appropriate statistical representation of the overall pre-existing water quality, the trigger levels will provide indications of new water quality impairments, not related to historical activities. This method will reduce the potential for trigger levels being exceeded at specific on-Site monitoring locations due to the migration of pre-existing water quality impairments within the Site boundaries.

It is recommended that the groundwater trigger level program focus on a reduced set of parameters that reflect the sources of potential impact from on-Site activities. These parameters will thus act as surrogates for Site-related water quality impacts. Based on a review of water quality data for the Site and the known sources of impact associated with organic waste processing, the trigger level program should include the following trigger parameters: ammonia, phosphorus, dissolved organic carbon, nitrate, iron, manganese, alkalinity and E. coli.

Ammonia, phosphorus, dissolved organic carbon; nitrate and E.coli are all direct indicators of groundwater quality impacts associated with the discharge of organic waste-related contaminants to the subsurface.

Alkalinity is a suitable indicator as it will increase in groundwater where biological consumption of dissolved organic carbon results in an increase in dissolved carbon dioxide. The increase in dissolved carbon dioxide results in the dissolution of carbonate from natural geologic materials within the aquifer and a corresponding increase in total alkalinity.

Iron and manganese concentrations typically increase in groundwater impacted by organic waste due to the alteration of redox conditions within the groundwater. The biological breakdown of dissolved organic matter consumes dissolved oxygen and related oxygen sources in groundwater and creates reducing conditions. Where conditions are reducing, naturally-occurring iron and manganese oxides within the geologic material are reduced to more soluble forms, which results in an increase in dissolved iron and manganese concentrations.

Shallow Unconfined Aquifer

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the shallow unconfined aquifer. The trigger levels are based on the 95% UTLs for aggregate pre-start-up groundwater data in the shallow unconfined aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	4.0 mg/L
Phosphorus	7.2 mg/L
Dissolved Organic Carbon	34.6 mg/L
Nitrate	1.3 mg/L
Iron	48.3 mg/L
Manganese	17.1 mg/L
Alkalinity	633 mg/L
E. coli	25.6 CFU/100mL

Deep Bedrock Unit

Insufficient pre-start-up water quality data is available to calculate UTLs on this basis for the bedrock aquifer. As an alternative, 95% UTLs have been calculated for the available data for TW-7, as this well is located in an upgradient position relative to Facility operations.

The following table provides the recommended trigger levels for the above-referenced trigger parameters for the bedrock aquifer. The trigger levels are based on the 95% (UTL) for upgradient (TW-7) groundwater data in the bedrock aquifer. The UTLs were calculated using methods that were appropriate for the observed parameter-specific data distribution (e.g. parametric-gamma, non-parametric, etc.).

Parameter	*Trigger Level*
Ammonia	0.2 mg/L
Phosphorus	0.5 mg/L
Dissolved Organic Carbon	18.4 mg/L
Nitrate	0.5 mg/L
Iron	10.6 mg/L
Manganese	2.1 mg/L
Alkalinity	996 mg/L
E. coli	5.0 CFU/100mL

A pumping test completed in 2008 within the deep bedrock unit as part of the Phase II ESA confirmed that the shallow unconfined aquifer and the deep bedrock unit are not hydraulically connected. For this reason, any exceedances of the above-referenced trigger levels for the deep bedrock unit should be reviewed in conjunction with other monitoring data to assess whether or not the exceedances are related to Facility operations. It is unlikely that Facility operations will affect deep bedrock unit water quality.

Trigger level program - Tiers

The TLP should be implemented using a series of three Tiers to verify the results and direct potential contingency implementation. The following paragraphs describe the three Tiers recommended to be included as part of the TLP.

Tier I – Routine Monitoring and Trigger Locations

Tier I monitoring involves the sampling of all on-Site groundwater monitoring wells at the frequency prescribed in the Site environmental monitoring program. All groundwater monitoring activities completed at the Site will be considered Tier I monitoring unless two or more trigger parameters exceed their respective trigger levels in a single sample.

Groundwater monitoring will be conducted at the Site, as follows:

- Tri-annually (three times per year) at MW101-13, MW102-09, MW104-13, MW105-09, MW5-09, MW106-15*
- Semi-annually (twice per year) at all remaining overburden and bedrock monitoring wells, respectively MW1-08, MW2-08, MW3-08, MW4-09, and MW103-09

*-Not yet installed

Tier II – Confirmation Monitoring

If during a single monitoring event, two or more trigger parameter concentrations exceed the established Tier I trigger concentrations at a single trigger location, the Tier II Confirmation Monitoring program will be implemented. The Tier II Confirmation Monitoring program consists of collecting water quality samples in duplicate from the location exhibiting the Tier I exceedance during the next scheduled monitoring event in order to confirm the Tier I exceedance of the two or more trigger parameters. If the concentrations reported in the duplicate samples return to below their respective trigger levels, then Tier I monitoring will resume.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to re-evaluate the degree, nature, and potential source(s) of trigger level impact(s) identified in Tier I. The implications of the exceedances in terms of the potential for impacts to downgradient off-Site water users should be given consideration in the evaluation.

The comparison of the observed water quality to generic criteria, the applicable regulatory compliance framework, the pre-existing water quality, and downgradient use of groundwater will dictate the timing and urgency of response. The comparison should also include parameter trend analyses over time and the contributions of sources of impact other than the Facility. If the Tier II Confirmation Monitoring program and subsequent evaluation indicate that Facility operations are having a detrimental effect on water quality migrating off-Site, then Tier III - Contingency Measures will be implemented.

Tier III – Contingency Measures and Compliance Monitoring

The Tier III portion of the TLP involves assessment and implementation of contingency measures in the event of imminent off-Site groundwater quality impairment. Contingency measures to be evaluated would include extraction of impacted groundwater and/or surface water for on-Site treatment or off-Site disposal, or acquisition of groundwater rights and registration of a contaminant attenuation zone on title of adjacent lands.

Tier III also includes ongoing monitoring to continually assess the effectiveness of any contingency measures that have been implemented. The Tier III compliance monitoring program details would be determined in conjunction with the development and implementation of preferred contingency measure(s). The compliance monitoring parameters, locations and monitoring frequency would be determined at the time of implementation of contingency measures.

Appropriate remedial alternatives should be evaluated in detail after exceedances are confirmed. As the nature of potential future water quality issues cannot be known in advance, it is not practical to develop remediation plans that will necessarily best suit the particular situation in the event of water quality impairment.

4.0 Closing

It is recognized that using pre-existing water quality data as the basis for the groundwater trigger level program will not necessarily provide an effective measure of the potential for off-Site migration of adverse water quality, as it relates to adjacent water uses. For this reason, it is necessary that evaluations of water quality included within the Annual Monitoring Reports take into consideration the potential for impairment of downgradient water quality uses, regardless of the nature of the source of the impact (off-Site sources, Facility operations, historical impacts, etc.).

As such, evaluations of the shallow unconfined aquifer should compare water quality adjacent to surface water courses to the Provincial Water Quality Objectives (PWQOs) to assess the potential effects of shallow groundwater discharging to surface. Evaluations of deep bedrock groundwater should compare water quality to the Ontario Drinking Water Quality Standards (ODWQSs).

MEMORANDUM

January 3, 2017

TO: Kyle Straberger
Senior Environmental Officer
Peterborough District Office
Eastern Region

MINISTRY OF THE ENVIRONMENT
JAN 11 2017
OTTAWA

FROM: Bob Holland
Hydrogeologist
Water Resources Unit
Technical Support Section
Eastern Region

RE: Orgaworld Organics Facility
2015 Groundwater and Surface Water Monitoring Report
Trigger Level Program
5123 Hawthorne Road
City of Ottawa
Hydrogeologic Assessment

I have reviewed the above noted report signed by Conestoga Rovers & Associates March 31, 2016 describing groundwater impacts related to the Orgaworld Organics Facility in Ottawa. The report also provides the Trigger Level Program (TLP) to protect groundwater from the impact of this new facility.

The consultant provides an assessment of the physical hydrogeology of the site. A shallow aquifer exists at the bedrock overburden interface. Water level monitoring has confirmed the inferred groundwater flow direction in the upper unconfined aquifer is to the east with some level of limited discharge to ditches located along the north site boundary. The Surface Water Unit should review this report as groundwater that does not meet Provincial Water Quality Objectives for ammonia may at times discharge to these ditches.

A deep aquifer exists in sandstone. Based on in-situ hydraulic testing the consultant has deemed there is no hydraulic connection between the deep aquifer and the unconfined shallow aquifer. Inferred groundwater flow in the deep aquifer is to the west. Contaminants of concerns identified are ammonia, iron, manganese, dissolved organic carbon, sulfate, and total dissolved solids. Groundwater quality mapping of ammonia, DOC, iron and manganese confirm that a plume extends in the shallow aquifer northeastward, originating in and around the northeast corner of the Organic Composting Facility. Some impacts have been detected in the deep aquifer.

A TLP has been proposed recognizing that past site activities and up gradient water quality issues exist and that an alternative method has been developed to assess the net impact of this new facility, bearing in mind that groundwater impairment must not occur. I have reviewed the proposed TLP and find it is acceptable to me.

I find the monitoring program rationalization acceptable to me.

In general, I agree with the conclusion and recommendations made by the consultant. Current remediation efforts must continue to improve groundwater quality at all down gradient monitoring wells relative to facility start up and any additional work as per the TLP. If a Tier III trigger is reached I should be consulted.

MEMORANDUM

TO:	Ministry of Environment and Climate Change	REF. NO.:	045804
FROM:	Ben Kempel/Tej Gidda/mg/27	DATE:	February 27, 2015
CC:	Ben Constable, CRA Michael Rooke, Orgaworld		
RE:	**Proposed Monitoring Program - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates has prepared this memorandum to outline the proposed groundwater and surface water monitoring programs for the Orgaworld Canada Ltd. (OCL) organic waste processing facility (Site) located at 5123 Hawthorne Road, Ottawa, Ontario. This memorandum has been prepared in support of an application to amend ECA No. 9465-7NVRWT (Industrial Sewage Works). The application is being submitted for the purpose of incorporating a groundwater TLP and revised groundwater and surface water monitoring programs into the ECA.

1.1 Current Monitoring Program

The current monitoring program for the Site is defined in the above-referenced ECA and includes hydraulic monitoring and sampling at 11 groundwater monitoring well locations within the shallow unconfined aquifer and 3 groundwater monitoring wells in the deep bedrock aquifer unit. The monitoring program also includes sampling at 4 surface water locations. The following locations are currently sampled on a semi-annual basis (twice per year):

Unconfined Shallow Aquifer	*Deep Bedrock Aquifer*	*Surface Water*
MW1-08	TW-4	SW-1
MW2-08	TW-7	SW-2
MW3-08	TW-8	SW-3
MW4-08		SW-4
MW4-09		

ISO 9001

The following locations are sampled on a quarterly basis.

Unconfined Shallow Aquifer
MW5-09
MW101-13
MW102-09
MW103-09
MW104-13
MW105-13

The current analytical parameter list for the Site, as per the Site's Environmental Compliance Approval (ECA No. 7251-8GKRPD, as amended) consists of selected general chemistry, bacteriologic components, metals, petroleum hydrocarbons (PHCs), and polycyclic aromatic hydrocarbons (PAHs).

A complete summary of the current monitoring program is provided in Table 1.

2.0 Proposed Monitoring Program

Based on the results of monitoring completed to date, there is sufficient data collected to warrant reductions in the monitoring program. The reductions in monitoring include changes in monitoring frequency at selected locations and removal of several analytical parameters from the list of analytes. The following sections discuss the proposed changes to the monitoring program.

2.1 Monitoring Frequency

A significant amount of monitoring data has been collected to date for the on-Site monitoring wells. The monitoring data has allowed for a comprehensive understanding of the spatial and temporal patterns in groundwater quality. As groundwater quality is generally well understood, it is recommended that monitoring frequency be reduced at selected locations.

During recent monitoring years, field staff has been unable to complete the winter monitoring event during February due to frozen monitoring wells. For this reason, it is recommended that the winter (February) monitoring event be removed from the monitoring program. Three monitoring events (spring, summer, and fall) should be maintained per year at locations where detailed groundwater monitoring is suitable.

The following table summarizes the recommended groundwater monitoring frequency.

Location	*Current Sampling Frequency*	*Proposed Sampling Frequency*	*Unit*	*Trigger Well*
MW101-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW102-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW103-09	Quarterly	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW1-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW2-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes
MW3-08	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW4-09	Semi-Annual	Semi-Annual	Unconfined Shallow Aquifer	Yes+
MW5-09	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW104-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW105-13	Quarterly	Tri-Annual	Unconfined Shallow Aquifer	Yes
MW106-15	NA	Tri-Annual	Unconfined Shallow Aquifer	Yes
EW107*	NA	Tri-Annual	Unconfined Shallow Aquifer	No
TW-4	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-7	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No
TW-8	Semi-Annual	Semi-Annual	Deep Bedrock Aquifer	No

*- Not yet installed
+ - Upgradient well
NA – Not applicable

As indicated in the above table, the recommended changes to the monitoring program include:

- Reduction of monitoring from quarterly to tri-annual (three times per year) at selected locations
- Reduction of monitoring from quarterly to semi-annual at MW103-09. This location is located away from verified sources of impact and semi-annual monitoring will provide adequate water quality data at this location.

It should be noted that the monitoring frequency specified above is consistent with the monitoring frequency proposed in the updated TLP.

Groundwater monitoring well (MW106) and extraction well (EW107) have not yet been installed, but are scheduled for installation prior to the spring 2015 monitoring event. These wells should be incorporated into the monitoring program at the monitoring frequency specified above, following installation.

Surface water sampling is currently conducted at two upstream locations: SW1-09 and SW2-09. The analytical results have generally been consistent between these two locations. As there are no Site-related sources of impact between SW-1 and SW-2, it is recommended that sampling at SW-1 be discontinued. As such, surface water quality monitoring should continue semi-annually at locations SW2-09 and SW3-09. SW4-09 should continue to be sampled on a monthly basis (when weather conditions permit safe sampling at this location).

2.2 Monitoring Parameters

The existing monitoring program includes sampling of groundwater and surface water for PHC and PAH parameters. The results of PHC and PAH analyses have demonstrated largely non-detect results for the majority of these parameter lists. The sporadic detections of PHCs or PAH parameters have been inconsistent and at very low concentrations often just above the detection limits. In addition, similar infrequent low-level detections have also been reported at background monitoring locations. Therefore, it is likely that any detection of PHCs or PAHs parameters are the result of background conditions and/or related to fill materials historically used in the vicinity of the Site. Thus, PHCs and PAHs are not considered useful in evaluating groundwater and surface water for potential environmental impacts related to Site operations.

It is recommended that PHCs and PAHs be removed from the current monitoring parameter list.

The recommended monitoring program for the Site is summarized in Table 2.

MEMORANDUM

TO:	Ministry of the Environment	REF. NO.:	045804-22
FROM:	Ben Kempel/Ben Constable/mg/25	DATE:	July 16, 2014
CC:	Tej Gidda, Ron Cherkewski, Mike Rooke		
RE:	**Groundwater Assessment and Work Plan - Orgaworld Canada Ltd., Ottawa, Ontario**		

1.0 Introduction

Conestoga-Rovers & Associates (CRA) has prepared this memorandum on behalf of Orgaworld Canada Ltd. (Orgaworld) to provide the Ministry of Environment (MOE) with the results of supplementary data assessment completed on groundwater monitoring data for the Orgaworld organic waste processing facility (Facility) located at 5123 Hawthorne Road, Ottawa, Ontario (Site). The assessment has been undertaken in response to identified increases in ammonia concentrations within shallow groundwater downgradient of the Facility. The assessment has focused on monitoring data for the most recent (2013) monitoring period and included the following activities:

- 2013 Data Assessment – Ammonia (Section 2.0)
- Additional Parameters of Concern (Section 3.0)
- Groundwater Discharge to Surface (Section 4.0)
- Data Gap Analysis (Section 5.0)

CRA has prepared a work plan for further investigating and characterizing groundwater at the Site. The purpose of the additional investigation is to refine the ammonia plume delineation, improve understanding of the aquifer properties on-Site, and determine the potential receptors associated with the plume.

Orgaworld currently operates under the following Environmental Compliance Approvals (ECA's) for the Site:

- Number 7021-7HQNDE (Air), September 16, 2009
- Number 9465-7NVRWT (Industrial Sewage Works), September 16, 2009
- Number 7032-88XPRA (Industrial Sewage Works), Amended September 7, 2010
- Number 7251-8GKRPD (Industrial Sewage Works), Amended May 30, 2011
- Number 2766-7HEPSZ (Waste Disposal Site), September 16, 2009, Amended under Notice No. 1, October 21, 2010

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

Condition 9 (8) of ECA Number 7251-8GKRPD requires that Orgaworld establish a comprehensive Compliance and Trigger Level Monitoring Program based on groundwater monitoring within two years of operations. The Compliance and Trigger Level Monitoring Program is to be submitted to the MOE along with an application to amend the ECA. Orgaworld has not applied to amend the ECA, as the monitoring data gathered since 2010 to define baseline conditions for the site has been influenced by both existing conditions at the Site, largely comprised of historical fill materials and adjacent to quarrying activities, and potentially the Facility's operations. This work plan has been specifically designed to present results and interpretation of the historical and current data and to define steps moving ahead to address groundwater quality.

The following sections discuss the results of the assessment and describe the proposed work plan.

2.0 2013 Data Assessment - Ammonia

Interpretations of pre-2013 analytical data identified the existence of an ammonia plume within shallow groundwater originating near the eastern side of the organics composting facility and migrating to the northeast towards the Site boundary. Elevated concentrations of ammonia were originally reported in historic monitoring well MW101-09 in May 2010. Elevated ammonia concentrations were detected in monitoring wells located downgradient of MW101-09 during subsequent monitoring events. Ammonia concentrations were observed to increase within the interpreted source area (MW101-09) and downgradient Site boundary monitoring wells (MW5-09, MW102-09) through 2012. Based on a review of 2013 data, elevated ammonia concentrations are persistent within the source area and concentrations continued to increase through 2013 at the downgradient monitoring wells. The Site groundwater monitoring network is illustrated on the attached Site Plan (Figure 1).

Monitoring well MW101-09 was abandoned during 2012 due to suspicions that the well integrity may have been compromised. In addition, several new monitoring wells were installed near the interpreted source area in early 2013. The analytical results from the initial year of sampling at MW101-13 and MW104-13 confirm that elevated concentrations of ammonia exist immediately downgradient of former historic monitoring well MW101-09. The analytical results from MW105-13 show that the elevated concentrations of ammonia are also present to the northeast of MW101-09.

Figures 2 through 7 illustrate ammonia concentrations versus time for the monitoring wells within the source area and downgradient along the Site boundary. As depicted in the Figures, ammonia concentrations have demonstrated increasing trends at monitoring wells MW104-13, MW5-09, MW102-09, and MW101-13.

3.0 Additional Parameters of Concern

A comparison of the 2012 through 2013 analytical data for downgradient monitoring wells (MW5-09, MW102-09, MW1-08) located along the northern Property boundary to the Ontario Drinking Water Standards (ODWS) and upgradient water quality at MW3-08 was completed to identify additional parameters of potential environmental concern within shallow groundwater. Based on this comparison,

several general chemistry and metals parameters have been reported at concentrations above their respective ODWS criteria, and significantly elevated above upgradient levels. The following additional parameters have been identified as potential parameters of concern. The maximum reported downgradient, Site boundary concentrations and respective ODWS criteria (in brackets) are as follows:

- Iron – 7.5 mg/L (0.3 mg/L)
- Manganese – 4.8 mg/L (0.05 mg/L)
- Dissolved Organic Carbon – 12.1 mg/L (10 mg/L)
- Sulfate – 872 mg/L (200 mg/L)
- Total Dissolved Solids – 2030 mg/L (500 mg/L)

It should be noted that, similar to the trend noted for ammonia, the concentrations of the above parameters have generally demonstrated increasing trends during recent years at monitoring wells immediately downgradient of the Facility.

Figures 8 through 11 provide concentration isopleths for ammonia, dissolved organic carbon (DOC), dissolved iron, and dissolved manganese based on the median sample results from 2013 monitoring in monitoring wells completed within the shallow aquifer. Each figure illustrates the presence of elevated concentrations in the interpreted source area and downgradient towards the northern Site boundary. Elevated concentrations of iron, manganese, DOC and TDS are consistent with the interpretation that the contaminant plume is related to an organic contaminant source. As indicated on these figures, there is little known about the western extent of the plume near the northern Site boundary. The proposed work plan for addressing this data gap is discussed in Section 5.3.

4.0 Groundwater Discharge to Surface

The presence of elevated ammonia concentrations within shallow groundwater is primarily a potential concern with respect to the discharge of shallow groundwater to surface water, due to the relatively low Provincial Water Quality Objective (PWQO) for un-ionized ammonia (0.02 mg/L). As such, it is recommended that the hydraulic relationship between shallow groundwater and surface water be investigated through the installation of staff gauges and measurement of static water levels in both shallow groundwater and surface water. The work plan for addressing this investigation is discussed in Section 5.3.

5.0 Data Gap-Analysis

There is sufficient evidence to confirm that a plume exists on-Site within the shallow groundwater adjacent to and downgradient of the Facility. The available groundwater quality data suggests that the plume consists of organics-related contaminants with elevated concentrations of ammonia. As part of the data assessment, CRA completed a data-gap analysis to identify areas where important information is unavailable concerning the contaminant nature, distribution or fate.

The following sections discuss the identified data gaps and outline the proposed action items for addressing the data gaps. Completing these action items forms the basis of the proposed work plan.

5.1 Surface Water Levels

As discussed previously, elevated ammonia concentrations within groundwater can be an issue of environmental concern when groundwater discharges to surface water, as the PWQO for un-ionized ammonia is low (0.02 mg/L). As such, it is important to understand whether or not shallow groundwater discharges to surface water at the Site to determine if the elevated ammonia concentrations are entering the surface water regime.

The comparison of shallow groundwater elevations with adjacent/nearby surface water elevations during quarterly monitoring events will determine whether or not groundwater is discharging to surface. As such, a series of staff gauges will be installed within the ditch along the north side of the Site (and any other on-Site surface water features, as appropriate). These staff gauges will be surveyed for geodetic reference. Surface water elevation measurements will then be incorporated into the monitoring program during each monitoring event. These measurements will be completed for a minimum of one year in order to observe the shallow groundwater - surface water relationship in different seasons.

Recommendations concerning the potential continuation of monitoring in the ditch will be made following one year of monitoring.

5.2 Complete Topographic Site Survey

It is understood that an as-built topographical survey of the site is unavailable. Accurate comparison of ground water levels to site grades is needed to verify if groundwater is discharging to the Site's surface water bodies. As such, an up to date topographical survey will be completed so this interface can be accurately assessed. The topographic survey will also be used to verify the pond levels and the outflow levels from the site into the Hawthorne Industrial Park.

5.3 Additional Monitoring Data

Groundwater

Although the current monitoring network has adequately identified the presence of an ammonia plume, the western extent of the contaminant plume along the northern Site boundary is currently unknown. Therefore, a shallow groundwater monitoring well will be installed to the west of MW5-09, as indicated on Figure 1 to better define the western extent of the plume. The proposed monitoring well will be incorporated into the regular monitoring program for quarterly sampling until sufficient data is gathered to warrant a monitoring reduction.

Surface Water

As discussed in Section 5.1, four (4) surface water staff gauges will be installed within the ditch along the north end of the Site in order to measure water levels within the ditch. The staff gauges will be geodetically surveyed so that measured water levels can be converted into static elevations. These static

elevations will be compared to the static groundwater elevations in adjacent groundwater monitoring wells to determine if shallow groundwater is discharging to this ditch. The proposed surface water staff gauge locations are illustrated on Figure 1.

5.4 Hydraulic Testing

In order to have a thorough understanding of the hydraulic characteristics of the shallow overburden and bedrock aquifers, additional testing of the aquifer properties will be completed along the northern Site boundary. This testing will be accomplished through single well response tests on the existing and proposed shallow groundwater monitoring wells in this area (MW5-09, MW102-09 and the proposed monitoring well).

The results of this testing will be used to better estimate the aquifer properties along the northern Site boundary.

6.0 Groundwater Remediation

In response to the identified groundwater plume, a single shallow groundwater extraction well will be installed near the ammonia scrubber. Based on the nature of the contaminants observed, the contaminant distribution and the interpreted source of leakage, the area immediately downgradient of the ammonia scrubber is considered the most suitable location for a remediation/extraction well.

The purpose of the extraction well will be to remove the most heavily impacted groundwater from the subsurface for use in the Facility process. Up to 15,000 L of groundwater can be used in the process daily. As such, this source removal strategy represents an ideal opportunity to control a significant portion of the plume without the need for treatment or trucking to a disposal facility.

7.0 Closing

It is anticipated that the installation of an additional monitoring well, a remediation/extraction well and establishment of surface water staff gauges will occur during the summer of 2014. The monitoring points will be incorporated into the regular monitoring program during the next regularly scheduled monitoring event.

The results of the above-described work program, including recommendations for next steps, will be provided to the MOE in a letter report following completion of the assessment.

We trust this to be complete and in order for your use. Should you have any questions, please do not hesitate to contact our office.
