EXECUTIVE SUMMARY

Assessment

A Phase I-Environmental Site Assessment (ESA) was carried out for 3252 Navan Road and a contiguous parcel of land referred to as Spring Valley Phase 5, in the City of Ottawa, Ontario. The purpose of the Phase I-ESA was to research the past and current use of the Phase I Property and Phase I Study Area and to identify environmental concerns with the potential to have impacted the Phase I Property.

The Phase I Property was first developed for residential purposes circa 1945 prior to the conversion of the site to commercial landscaping depot in approximately 1983. The former presence of two diesel AST locations used in conjunction with this activity are on-site PCAs that are considered to result in two APECs on the Phase I Property.

Fill material of unknown quality was identified in the northern half of the Phase I Property during previous investigations. Stockpiles of fill material were also historically present in the western portion of the Phase I Property the origin of which is unknown. The presence of fill material in these locations are on-site PCAs that are considered to result in two APECs on the Phase I Property.

The neighbouring lands have historically consisted primarily of residential use land (dwellings), with landfill operations (industrial use) commencing at 3354 Navan Road around 1965 and continuing to the present day. It should be noted that the landfill does not take domestic waste and solely accepts construction and demolition waste. Off-site landfilling activity is a PCA considered to result in an APEC on the Phase I Property. A railway line was historically present approximately 80 m south of the Phase I Property until it was removed around the mid 1970s. Based on the separation distance, the former rail line is not considered to result in an APEC on the Phase I Property.

Following the historical review, a site visit was conducted. The Phase I Property is being used as a construction site office and for the storage of miscellaneous construction materials, with the remainder consisting of unused former agricultural land.

The neighbouring properties are primarily used for residential purposes with the Navan Road landfill located on the adjacent property to the east, previously discussed. No additional off-site PCAs were identified within the Phase I Study Area.

Recommendations

Based on the findings of the Phase I-ESA, it is our opinion that **a Phase II-ESA is required for the Phase I Property.**

Based on the age of the subject building (circa 1945), asbestos-containing materials (ACMs) are potentially present in the subject structure. The potential ACMs observed during the site visit include drywall joint compound and vinyl floor tiles. A Designated Substance Survey (DSS) of the building must be conducted in accordance with Ontario Regulation 278/05, under the Occupational Health and Safety Act, prior to any major renovation or demolition activities.

1.0 INTRODUCTION

At the request of Claridge Homes, Paterson Group (Paterson) carried out a Phase I-Environmental Site Assessment (Phase I-ESA) of 3252 Navan Road and an adjacent unaddressed parcel referred to as Spring Valley Phase 5, in the City of Ottawa, Ontario. The purpose of this Phase I-ESA was to research the past and current use of the site and study area to identify any environmental concerns with the potential to have impacted the subject property.

Paterson was engaged to conduct this Phase I-ESA by Ms. Victoria St. Pierre of Claridge Homes. Ms. St. Pierre can be contacted via her mailing address at 210 Gladstone Avenue, Ottawa, Ontario, K2P 0Y6.

This report has been prepared specifically and solely for the above-noted project which is described herein. It contains all of our findings and results of the environmental conditions at this site.

This Phase I-ESA report has been prepared in general accordance with Ontario Regulation 153/04, as amended by O.Reg. 269/11 (Environmental Protection Act), and also complies with the requirements of CSA Z768-01 (reaffirmed in 2022). The conclusions presented herein are based on information gathered from a limited historical review and field inspection program. The findings of the Phase I-ESA are based on a review of readily available geological, historical, and regulatory information and a cursory review made at the time of the field assessment. The historical research relies on information supplied by others, such as local, provincial and federal agencies and was limited within the scope-of-work, time and budget of the project herein.

2.0 PHASE I PROPERTY INFORMATION

Address:	3252 Navan Road, and unaddressed parcel, Ottawa, Ontario.
Property Identification Numbers:	04352-0307, 04352-1331
Location:	The Phase I Property is located on the south side of Navan Road, east of Spring Valley Drive. The Phase I Property is shown on Figure 1 - Key Plan following the body of this report.
Latitude and Longitude:	45° 25' 34" N, 75° 30' 31" W

Site Description:

Configuration:	Irregular
Site Area:	12.7 ha (approximate)
Zoning:	DR – Development Reserved Zone
Current Use:	The Phase I Property currently consists of undeveloped land being used as a construction staging area for adjacent development. The property use as defined by O.Reg. 153/04 is Commercial Use, based on the properties previous use.
Services:	The Phase I Property is located in an area of mixed municipal and private services.

3.0 SCOPE OF INVESTIGATION

The scope of work for this Phase I – Environmental Site Assessment was as follows:

- ❑ Determine the historical activities on the subject site and study area by conducting a review of readily available records, reports, photographs, plans, mapping, databases, and regulatory agencies;
- ❑ Investigate the existing conditions present at the Phase I ESA Property and study area by conducting site reconnaissance;
- ❑ Conduct interviews with persons knowledgeable of current and historic operations on the Phase I ESA Property, and if warranted, neighbouring properties;
- ❑ Present the results of our findings in a comprehensive report in general accordance with the requirements O.Reg. 153/04 as amended under the Environmental Protection Act and in compliance with the requirements of CSA Z768-01;
- ❑ Provide a preliminary environmental site evaluation based on our findings;
- ❑ Provide preliminary remediation recommendations and further investigative work if contamination is suspected or encountered.

4.0 RECORDS REVIEW

4.1 General

Phase I-ESA Study Area Determination

A radius of approximately 250 m was determined to be appropriate as a Phase I ESA Study Area for this assignment. Properties outside the 250 m radius are not considered to have impacted the Phase I Property, based on their significant distance from the site.

First Developed Use Determination

Based on a review of aerial photographs and available historical information, the Phase I Property is considered to have first been developed with a residential dwelling (Residential Use) prior to 1945.

Fire Insurance Plans

Fire Insurance Plans (FIPs) are not available for the area of the Phase I Property.

City of Ottawa Street Directories

City directories at the National Archives were reviewed in approximate 10-year intervals from 1980 (Phase I Property first appears at this time) to 2011 (last listed date) as part of the Phase I ESA.

The property addressed 3252 Navan Road (Part of the Phase I Property) was listed in the directories as occupied by Andre Taillefer Ltd. (topsoil and landscaping materials) from 1980 until 2011. The remaining portion of the Phase I Property (Spring Valley Phase 5; unaddressed parcel) was not listed.

Properties in the Phase I Study Area were listed primarily as residential or vacant with one exception. The property addressed 3354 Navan Road was most recently listed as BFI Canada and was formerly listed as Waste Services Inc. and Huneault Waste Management (Navan Road Landfill).

This landfill activity to the east represents a potentially contaminating activity (PCA) resulting in an area of potential environmental concern (APEC) on the eastern portion Phase I Property.

Chain of Title

Paterson requested a Chain of Title for the portion of the Phase I Property addressed 3252 Navan Road, during a previous assessment from Read Abstracts Limited in 2019.

This parcel was originally registered in 1881 to a private individual. Private individuals owned the property until 1946 when the property was registered to The Director of the Veterans Land Act. In 1965, the property was transferred to private individuals and has been held privately ever since. The last listed registered owner in the chain of title is Ih Chu and Shih Ping Sun in 1982.

A separate Chain of Title search was completed for the remainder of the Phase I Property (Spring Valley Phase 5 parcel). This portion of the Phase I Property was originally registered in 1811 to private individuals, and was owned by various private individuals until 1964 when it was registered to Perrodale Farms Limited. The parcel was then transferred to Claridge Homes (Carson) Inc. in 2004 (current owner).

No environmental concerns were identified during a review of the Chain of Title searches. A copy of these searches has been provided in Appendix 1.

Plan of Survey

A plan of survey, dated 1982 and amended 1984, prepared by J G Payette Ontario Land Surveyor, was provided to Paterson for review. The survey plan shows the portion of the Phase I Property addressed 3252 Navan Road in its current configuration.

A plan of survey, prepared by Annis, O'Sullivan, Vollebekk Ltd., was reviewed as part of this assessment. The survey plan consists of a draft plan of subdivision dated January 30, 2009. The survey plan shows the entire Spring Valley development property, including the Phase 5 portion of the Phase I Property, in its current configuration.

A copy of the provided plans of survey are included in Appendix 2.

4.2 Environmental Source Information

Environment Canada

A search of the National Pollutant Release Inventory (NPRI) was conducted electronically on September 16, 2025. The Phase I Property was not listed in the NPRI database however, the property to the east (BFI Navan Road Landfill) was listed in the NPRI database for the disposal and discharge to the air of various materials including friable asbestos.

PCB Inventory

A search of the provincial PCB waste storage sites was conducted on September 16, 2025. No PCB waste storage sites were identified within the Phase I Study Area.

MECP Waste Disposal Site Inventory

The Ontario Ministry of Environment document titled "Waste Disposal Site Inventory in Ontario, 1991" was reviewed as part of the historical research. This document includes all recorded active and closed waste disposal sites, industrial manufactured gas plants and coal tar distillation plants in the Province of Ontario.

Based on the available information, there is one active landfill site within the Phase I Study Area, present on Parts of Lots 3 and 4, Concession 4, Gloucester Township (currently Waste Connections of Canada landfill). No other waste disposal sites were identified within the Phase I Study Area.

As previously discussed, the existing landfill on the property to the east represents a PCA resulting in an APEC on the Phase I Property.

Ontario Ministry of Environment, Conservation and Parks (MECP) Instruments

A request was submitted to the MECP Freedom of Information office for information with respect to records concerning environmental incidents, orders, offences, spills, discharges of contaminants or inspections maintained by the MECP for the site or adjacent properties.

The response from the ministry included the 2021 landfill operating and monitoring report. Paterson reviewed the provided report in full and a brief summary of the findings are presented in the “Previous Engineering Reports” section.

MECP Coal Gasification Plant Inventory

The Ontario Ministry of Environment, Conservation and Parks document titled "Municipal Coal Gasification Plant Site Inventory, 1991" was reviewed to reference the locations of former plants with respect to the site. No coal gasification plants were identified on the Phase I Property or within the Phase I Study Area.

MECP Incident Reports

A request was submitted to the MECP Freedom of Information office for information with respect to records concerning environmental incidents, orders, offences, spills, discharges of contaminants, or inspections maintained by the MECP for the subject or neighbouring properties. No records pertaining to incidents on the Phase I Property were included in the response provided by the MECP.

A copy of the MECP FOI response is provided in Appendix 2.

MECP Waste Management Records

A request was submitted to the MECP Freedom of Information office for information with respect to waste management records for the subject property. No records pertaining to waste management records for the Phase I Property were included in the response provided by the MECP.

A copy of the MECP FOI response is provided in Appendix 2.

MECP Submissions

A request was submitted to the MECP Freedom of Information office for information with respect to reports related to environmental conditions for the Phase I Property. No records pertaining to MECP submissions for the Phase I Property were included in the response provided by the MECP.

A copy of the MECP FOI response is provided in Appendix 2.

MECP Brownfields Environmental Site Registry

A search of the MECP Brownfields Environmental Site Registry was conducted electronically for the Phase I Property and for properties located within the Phase I Study Area.

An RSC was filed for a larger parcel, including a small portion of the Phase I Property, in 2017 (Spring Valley Development, Phase 3). The RSC was based on a Phase I and II ESA to assess APECs associated with fill material of unknown quality in various locations, and potential impacts from the nearby landfill. The Phase I and II ESA were completed for a larger parcel then the RSC was filed for, which included the Spring Valley Phase 5 portion of the current Phase I Property. The relevant information from this previous reporting has been incorporated into the relevant sections of this report.

Two RSCs were identified within the Phase I Study Area and are associated with the properties addressed 3317 Navan Rd, Gloucester dated May 2009 and the adjacent property to the west that did not have a municipal address at the time of submission. No impacted soil or groundwater was identified during the Phase II – ESA completed as part of the RSC on the adjacent property to the west and as such, the submitted RSC is not considered to represent an environmental concern to Phase I Property. The RSC for 3317 Navan Road did not require the completion of a Phase II ESA and is also not considered to represent an environmental concern to the Phase I Property.

Areas of Natural and Significance Interest

A search for areas of natural significance and features within the Phase I Study Area was conducted electronically via the Ontario Ministry of Natural Resources and Forestry (MNRF) website. The Mer Bleue Bog conservation area is located approximately 100 m south of the Phase I Property.

Technical Standards and Safety Authority (TSSA)

The TSSA, Fuels Safety Branch in Toronto was contacted electronically, to inquire about current and former underground storage tanks, spills and incidents for the site and neighbouring properties. According to the TSSA response, no records were identified on the Phase I Property.

Several records pertaining to active fuel service appliances and gaseous fuels were documented for the landfill on the property to the east addressed 3354 Navan Road (Waste Connections of Canada).

As previously discussed, the active landfill on the property to the east is a PCA that is considered to result in an APEC on the Phase I Property.

A copy of the TSSA correspondence is included in Appendix 2.

City of Ottawa Old Landfill Sites

The City of Ottawa's Former Landfills online map, last updated July 29, 2025, was reviewed as part of this assessment. This map identifies 123 former landfills through the City of Ottawa's Old Landfill Management Strategy (OLMS 2004) and includes location, ownership, periods of operation and waste type for 82 sites identified as previously owned/operated either fully or in part by former municipalities and townships within the boundaries of the City of Ottawa.

A review of this map on September 17, 2025, identified the landfill located at 3354 Navan Road (Waste Connections of Canada) as Huneault Waste Management, Waste Disposal Site. This waste disposal site is currently active and has been previously identified as a PCA resulting in an APEC on the Phase I Property.

City of Ottawa Historical Land Use Inventory (HLUI)

A search of the City of Ottawa's Historical Land Use Inventory (HLUI) database was conducted as part of this assessment.

The response to the HLUI listed the previous use of the eastern portion of the Phase I Property (3252 Navan Road) as Andre Taillefer Ltd., noting heavy equipment rental, sand, crushed stone, and topsoil operations. Records pertaining to the landfill on the adjacent property to the east were included in the HLUI response. As previously discussed, the landfill on the adjacent property to the east is considered to represent a PCA that results in an APEC on the Phase I Property. No additional PCAs were identified through a review of the HLUI response. A copy of the HLUI response form is provided in Appendix 2.

Previous Engineering Reports

The following reports were reviewed prior to conducting this assessment:

<u>Spring Valley Phase 5 (southwestern portion of the Phase I Property)</u>

- ‘Phase I Environmental Site Assessment, Vacant Land, Spring Valley Development, Phase 3, Ottawa, Ontario’, prepared by Paterson Group, dated January 17, 2014.

A Phase I ESA was completed in 2014 for a parcel that included a portion of the Phase I Property (Spring Valley Phase 5, southwestern portion of the Phase I Property). According to historical research conducted as part of the 2014 Phase I

ESA, this property was vacant and/or used for agriculture from earliest available record. During the Phase I ESA, no on-site PCAs were identified.

Three off-site PCAs were identified based on historical research and observations during the site reconnaissance. The BFI Canada Navan Road Landfill, located approximately 100 m to the east, has been present since the 1970s. A rail line was also considered as an off-site PCA. The property adjacent to the east, being operated as Andre Taillefer Landscaping Products, contributed to an off-site PCA (part of the current Phase I Property). The two off-site PCAs, Navan Road Landfill and Andre Taillefer Ltd. were considered to have potential to represent Areas of Potential Environmental Concern to Phase I Property.

Based on the findings of the Phase I ESA, a Phase II ESA was recommended for the Phase I Property.

- ‘Phase II Environmental Site Assessment, Vacant Land, Spring Valley Development, Phase 3, Ottawa, Ontario’, prepared by Paterson Group, dated October 17, 2016.

The purpose of the Phase II ESA was to address the areas of potential environmental concern identified in the Phase I ESA, due to presence of two off-site PCAs. The report summarizes the findings of subsurface investigation completed at the site in 2002, 2007, and 2008, subsequent sampling events, and a groundwater and methane monitoring program completed between November 2008 and December 2009.

Soil samples were submitted for laboratory analysis of BTEX, PHCs, metals, and PAHs. Concentrations of vanadium at BH2-07-SS5 and BH3-07-SS6 marginally exceeded MECP Table 3 standards. In the absence of a specific source of vanadium and based on experience with similar sites in the Ottawa area, the vanadium exceedances are considered to be naturally occurring. All other parameter concentrations were in compliance with MECP Table 3 standards.

Groundwater samples were obtained from the monitoring wells and submitted for analysis of PHCs, metals, inorganic parameters, VOCs, and PAHs. All parameter concentrations were in compliance with MECP Table 3 standards.

Methane monitoring conducted between November 2008 and December 2009 presented elevated reading from the fill material formerly present along the eastern site boundary. The elevated methane concentrations were considered to be the

result of the fill material, which was removed, and were not indicative of methane migration from the Navan Road Landfill.

Based on analytical results in Phase II ESA, no impact to the site soils or groundwater was identified resulting from the identified Areas of Potential Environmental Concern. Furthermore, no potential for future impacts to the subject site were anticipated based on the geology, hydrology, and the configuration of the landfill. No further assessment was recommended.

- ‘Phase I Environmental Site Assessment Update, Phase 5 Residential Development - Spring Valley, Ottawa, Ontario’, prepared by Paterson Group, dated March 21, 2018.

An update letter was completed for Phase 5 of the Spring Valley residential development, covering the southeast portion of the previously assessed property (part of the current Phase I Property). Based on the updated records review and the site reconnaissance, Navan Road Landfill was considered to have resulted in Area of Potential Environmental Concern.

Based on the findings of the Phase I ESA, a Phase II ESA was recommended for the Spring Valley Phase 5 property.

- ‘Phase II Environmental Site Assessment, Spring Valley Phase 5 – Vacant Land, Ottawa, Ontario’, prepared by Paterson Group, dated March 21, 2018.

A Phase II ESA was carried out for this parcel to assess potential impacts resulting from the off-site landfill to the east.

Phase II ESA consisted of the drilling of three (3) boreholes and the installation of three (3) groundwater monitoring wells to assess soil and groundwater quality at the subject site. Soil samples were selected for analysis of PHCs F1-F4, VOCs and metals. All results were in compliance with the MECP Table 3 standards, with the exception of vanadium. Based on the lack of any potential sources of vanadium on the property, the detected vanadium was considered to naturally occurring and is not considered to be a contaminant of concern.

Groundwater samples were submitted for analytical testing for PHCs F1-F4, VOCs and metals. All analytical test parameters were found to be in compliance with site standards. No further work was recommended at the time of Phase II-ESA.

3252 Navan Road (eastern portion of the Phase I Property)

- ❒ "Phase I – Environmental Site Assessment Update, 3252 Navan Road, Ottawa, Ontario", prepared by Paterson Group Inc., dated December 9, 2019.

A Phase I ESA was previously completed for the portion of the Phase I Property addressed 3252 Navan Road (eastern portion of the Phase I Property). Based on the findings of the 2019 Phase I ESA Update, four APECs were identified on this portion of the Phase I Property in the form of fill material of unknown quality in the northern and central portions of the property, one former above ground diesel storage tank (AST), two existing ASTs (colored and clear diesel) and an active landfill on the adjacent property to the east.

The presence of APECs on the Phase I Property resulted in the recommendation and completion of a Phase II – ESA.

- ❒ "Phase II – Environmental Site Assessment Update, 3252 Navan Road, Ottawa, Ontario", prepared by Paterson Group Inc., dated February 21, 2020.

The subsurface investigation was conducted in two phases. The first phase consisted of drilling nine boreholes, all of which were instrumented with groundwater monitoring wells.

Soil impacted with VOCs (bromomethane and chloroform) was identified in BH7 which was located in the southern half of the Phase I Property. Additionally, metals (cobalt and vanadium) exceedances were identified in BH7 and BH8, as well as off-site locations relative to the current Phase I Property, to the south. The cobalt and vanadium concentrations were determined to be naturally occurring based on the soil type (native silty clay) present throughout the Phase I Property, and are not considered to be contaminants of concern.

Groundwater impacted with tetrachloroethylene was identified in BH1 in the first phase of the subsurface investigation.

The second phase of the subsurface investigation involved the advancement of four additional boreholes, all of which were instrumented with groundwater monitoring wells.

No additional impacts were identified with respect to the soils on the Phase I Property.

Tetrachloroethylene impacts were identified in the second groundwater sample obtained from BH1 but the concentration was substantially lower. Four monitoring wells were placed to delineate the tetrachloroethylene impacted groundwater and the analytical test results indicated that the impacts were limited to the immediate area of BH1, as no tetrachloroethylene concentrations were identified in these locations.

Based on the results of the Phase II – ESA, it was recommended that further delineation of the impacted soil within BH7 be completed. It was determined that the impacted groundwater with BH1 was sufficiently delineated and that the groundwater monitoring wells should be maintained for future monitoring purposes.

- ❒ "2021 Landfill Monitoring, Waste Connections of Canada, 3354 Navan Road, Ottawa, Ontario", prepared by WSP Golder Inc., dated March 2022.

WSP Golder completed a 2021 landfill monitoring report for the Navan Waste Recycling and Disposal Facility that was issued in March of 2022.

The report is used to support the annual site operations and monitoring report and highlights the results of groundwater, surface water, leachate and sediment monitoring completed at the landfill.

Various leachate indicator parameters were analysed as part of the assessment. Based on the analytical test results, the leachate generated at the Navan Road Recycling and Disposal facility remains relatively unchanged from previous monitoring activities, in that it is considered to be weak wastewater in comparison to leachate generated from municipal landfills.

The analysed groundwater in two monitoring well locations exhibited concentrations that showed an increasing trend that was beyond the background range. The elevated concentrations were in the form of manganese and ammonia identified in monitoring wells in the southern portion of the landfill property. The manganese concentration was observed in a monitoring well immediately south of the waste disposal area and the ammonia was observed in a well located at the southern boundary of the waste disposal area.

The elevated concentration of magnesium indicating an increasing trend, was above the maximum concentration identified at a leachate sampling site. As such, it was determined that the exceeding concentration of manganese was not the cause of further landfill leachate migration and a contingency action in addition to

the voluntary actions already being implemented by the landfill, was not deemed necessary.

Based on the identified elevated ammonia concentration occurring in two consecutive sampling events, it was recommended to increase the trigger concentration if future results do not demonstrate an upward trend and the data is considered to be accurate. The recommendation was provided in the scenario where the groundwater quality at the monitoring well location remains considered to be unimpacted by landfill leachate.

The groundwater flow direction is considered to be north to south in the monitoring report and as such, the wells exhibiting the increasing trend beyond the background range are considered to be cross gradient from the Phase I Property. The leachate collection system and perimeter collection trench located along the west and south edges of the waste footprint also serve as a prevention mechanism to reduce the potential for off-site migration of the leachate. As such, the potential for groundwater impacts resulting form the landfill is considered to be negligible.

Environmental Risk Information Service (ERIS) Report

An ERIS (Environmental Risk Information Service) Report was obtained for the Phase I Property and properties within the Phase I Study Area.

Based on the ERIS report, there was one record documented for the Phase I Property.

The documented record pertains to an ERIS Historical Search completed on the Phase I Property in May of 2020. The identified record is not considered to represent an environmental concern on the Phase I Property.

Sixteen (16) total records from various databases were identified in the ERIS search within the 250 m search radius, all of which pertain to Environmental Compliance Approvals for municipal and private sewage work approvals as well as municipal drinking water systems approvals.

As previously discussed, an RSC was submitted for the adjacent property to the west and based on details contained within the RSC submission, it is not considered to represent an environmental concern to the Phase I Property.

No additional PCAs were identified through a review of the ERIS Database Report.

4.3 Physical Setting Sources

Aerial Photographs

Historical air photos from the National Air Photo Library and/or the City of Ottawa GeoOttawa website were reviewed in approximate 10-year intervals. The review period dates back to the first available air photos for the site. Based on the review, the following observations have been made:

1945 The Phase I Property consists of agricultural fields and vacant forested areas, with a farmhouse and outbuilding present on the northern portion of the property. Navan Road can be seen in its current configuration immediately north of the Phase I Property and a railway line exists to the south. Residential dwellings can be seen fronting onto Navan Road to the east and west of the Phase I Property.

1953 No significant changes appear to have been made to the Phase I Property or neighbouring properties since the previous photograph.

1965 No significant changes appear to have been made to the Phase I Property since the previous photograph. The landfill to the east of the Phase I Property is in the initial stages of development and use.

1976 No significant changes have been made to the Phase I Property since the previous photograph. The landfill to the east of the Phase I Property has been further developed and now extends to the south and east. The adjacent property to the west appears to be in the initial stages of development as the northern portion has been excavated and graded. The railway to the south no longer appears to be in use.

1991 The northern portion of the Phase I Property has been graded and stockpiled material is now present in this area. The landfill on the adjacent property to the east extends to the north and south towards Navan Road and the railway, respectively. Additional residential development has occurred further north of Navan Road.

2002 Additional stockpiles of soil are present on the northern portion of the Phase I Property and extend on to the adjacent property to the west. The landfill on the adjacent property to the east has now expanded further west, encroaching upon the eastern property boundary of the Phase I Property.

2011 No significant changes appear to have been made to the Phase I Property or neighbouring properties since the previous photograph.

2017 Additional stockpiles of soil and equipment have been placed in the northern portion of the property. The neighbouring properties appear to be unchanged since the previous photograph.

2023 No significant changes appear to have been made to the Phase I Property since the previous photograph. The adjacent property to the west has been developed for residential use.

Copies of selected aerial photographs reviewed are included in Appendix 1.

Topographic Maps

Topographic maps were obtained from Natural Resources Canada – The Atlas of Canada website and from the City of Ottawa website. The topographic map indicates that the Phase I Property is approximately 80 m above sea level and that regional topography generally slopes down towards the south towards the Mer Bleue conservation area.

Physiographic Maps

A Physiographic Map was reviewed from the Natural Resources Canada – The Atlas of Canada website. According to this physiographic map, the site is located in the St. Lawrence Lowlands. According to the mapping description provided: “The lowlands are plain-like areas that were all affected by the Pleistocene glaciations and are therefore covered by surficial deposits and other features associated with the ice sheets.” The subject site is located in the Central St. Lawrence Lowland, “where the land is rarely more than 150 m above sea level, except for the Monteregian Hills, which consist of intrusive igneous rocks”.

Geological Maps

The Geological Survey of Canada website on the Urban Geology of the National Capital Area was consulted as part of this assessment.

Based on the information from NRCAN, bedrock in the area of the site consists of shale, limestone, dolostone and siltstone of the Billings Formation. Based on the maps, both the thickness and composition of the overburden vary across the site. The northern portion of the Phase I Property consists of granular glaciomarine sediments with an overburden of approximately 50 m.

The central portion of the Phase I Property consists of colluvial deposits, and the southern portion of the Phase I Property consists of fine-grained glaciomarine sediments with a drift thickness of approximately 30 m.

Water Well Records

A search of the MECP's web site for all drilled well records within 250 m of the Phase I Property was conducted. The search identified two records in the Phase I Study Area. One record detailed a domestic water supply well drilled in 1977 to a depth of 45.7 m located approximately 220 m east of the Phase I Property. The second record pertains to the abandonment of a well located at 3225 Navan Road in 2015, located approximately 30 m north of the Phase I Property.

Groundwater level measurements obtained from monitoring wells installed on the Phase I Property during the previous subsurface investigations were documented to range from 0.05 to 5.95 m below the existing ground surface.

Bedrock was not encountered during the subsurface investigations. Monitoring wells were advanced to a maximum depth of 11.28 m and were terminated in the native grey silty clay layer.

Water Bodies and Areas of Natural Significance

One ditch runs from Navan Road at the northern boundary of the site, along the eastern boundary to the southern portion of the property before heading west and leading to the Mer Bleue conservation area. No other water bodies or areas of natural significance were identified in the Phase I Study Area.

5.0 INTERVIEWS

Property Owner Representative

As part of the previous assessments, Mr. Vincent Denomme of Claridge Homes, was interviewed via email. Mr. Denomme informed Paterson that there is currently no fuel or oil being stored on the Phase I Property and that the property is currently being used as a construction site office. Mr. Denomme stated that the Spring Valley Phase 5 portion of the Phase I Property has never been developed and has always been vacant agricultural land. Mr. Denomme was also unaware of any environmental concerns on the Phase I Property or in the immediate vicinity.

Paterson confirmed with representatives of the Claridge homes, that there have been no additional environmental concerns at the Phase I Property. No new environmental information was provided as part of the updated interviews.

6.0 SITE RECONNAISSANCE

6.1 General Requirements

A site reconnaissance visit was carried out on May 17, 2024, and weather conditions were cloudy with the temperature of 25 °C. Mr. Kuldeep Panchal from the Environmental Department of Paterson Group conducted the site visit. In addition to the site, the uses of neighbouring properties within the Phase I Study Area were also assessed at the time of the site visit.

6.2 Specific Observations at the Phase I Property

Buildings and Structures

One two-storey construction site office is situated on the northern portion of the Phase I Property. The building has a concrete slab-on-grade foundation, and the exterior is finished with vinyl siding and a sloped shingled roof. The building was constructed in approximately 1945 and was previously heated with propane gas.

Site Features

The Phase I Property consists primarily of gravel access roads that traverse the northern portion of the property and are used in conjunction with development activities on the adjacent property to the west.

Stockpiles of miscellaneous construction materials were observed in the northern portion of the Phase I Property. The central portion of the Phase I Property is also occupied by several large stockpiles of fill material.

The southern portion of the property slopes down towards the Mer Bleue Bog.

Potential Environmental Concerns

- **Fuels and Chemical Storage**

  No ASTs or signs of USTs were observed on the exterior of the Phase I Property at the time of the site visit. No staining or unusual odours were noted in the area of the former ASTs.

- **Waste Management**

  The Phase I Property is not currently generating any waste.

- **Polychlorinated Biphenyls (PCBs)**

  No potential concerns were identified with respect to PCBs on the exterior of the Phase I Property.

- **Ozone Depleting Substances (ODSs)**

  Potential sources of ODSs observed on-site during the assessment include fire extinguishers. These appliances should be regularly serviced by a licensed contractor.

Interior Assessment

A general assessment of the interior of the subject building is as follows:

- The floors consisted of concrete and vinyl tile.
- The walls and ceilings consisted of drywall.
- Lighting throughout the building was of fluorescent and incandescent fixtures.

Potentially Hazardous Building Products

- **Asbestos Containing Materials (ACMs)**

  Based on the age of the residential dwelling (prior to 1945), asbestos may be potentially present within certain building materials. The potential ACMs identified at time of the site inspection include the drywall joint compound and vinyl floor tiles. These building materials were observed to be in good condition at the time of the site inspection and do not pose an immediate concern.

❑ **Lead-Based Paint**

Based on the age of the subject building, lead-based paints may be potentially present on any original or older painted surfaces. The painted surfaces within the building were generally observed to be in good condition at the time of the site inspection.

❑ **Polychlorinated Biphenyls (PCBs)**

No potentially PCB containing materials were observed on the interior of the subject building during the site inspection.

❑ **Urea Formaldehyde Foam Insulation (UFFI)**

No signs of UFFI were noted at the time of the site visit, however, it should be noted that interior wall and ceiling cavities were not inspected for insulation type at the time of the site visit.

Other Potential Environmental Concerns

❑ **Fuels and Chemical Storage**

No environmental concerns were identified with respect to fuel or chemical storage within the residential dwelling.

❑ **Wastewater Drainage**

The Phase I Property is not currently generating any wastewater.

Neighbouring Properties

An inspection of the neighbouring properties was conducted from publicly accessible roadways at the time of the site inspection. Land use adjacent to the subject site was as follows:

❑ *North* Navan Road followed by residential dwellings.

❑ *South* The Prescott Russell Trail Link followed by the Mer Bleue conservation area.

❑ *East* Waste Connections of Canada's Navan Road Landfill.

❑ *West* Spring Valley residential development.

As previously discussed, the presence of the landfill immediately east of the Phase I Property is considered to represent a PCA that results in an APEC on the Phase I Property. Land use within the Phase I Study Area is shown on Drawing PE4588-2 - Surrounding Land Use Plan.

7.0 REVIEW AND EVALUATION OF INFORMATION

7.1 Land Use History

The following table indicates the current and past uses of the Phase I Property as well as associated potentially contaminating activities dating back to the first developed use of the property.

Table 1A: Land Use History (3252 Navan Road)

Year	Name of Owner	Property Use	Description of Property Use	Other Observations from Aerial Photos, FIPs, etc.
Prior to 1945	N/A	Undeveloped	Agricultural or Other Use	NA
1945 to 1983	Daniel A. Tisdelle and Laurent Leblanc	Residential	Residential Use	The 1945 aerial photograph shows a residential dwelling in the northern portion of the property.
1983 to 2019	Andre Taillefer Ltd.	Aggregate and groundworks supplier	Commercial Use	Aerial photography from 1991 to 2019 show the grading, excavation, and stockpiling of materials as well as three ASTs on the Phase I Property
2019 to present	Claridge Homes	Storage of Construction Materials and Soil	Commercial Use	2022 Aerial photograph shows Phase I Property as being occupied by sea cans and miscellaneous construction materials

Table 1B: Land Use History – Spring Valley Phase 5 Lands				
Year	**Name of Owner**	**Property Use**	**Description of Property Use**	**Other Observations from Aerial Photographs, FIPs, etc.**
Prior to 1964	Multiple Owners	Vacant undeveloped agricultural land	Agricultural or Other Use	Site is shown as vacant undeveloped land in 1945 and 1953 aerial photos. Site is considered to have been vacant undeveloped agricultural land since the time of its crown patent.
1964-2004	Perrodale Farms Limited	Vacant undeveloped agricultural land	Agricultural or Other Use	Aerial photos and site visit undertaken during this time frame indicate that the subject site is vacant undeveloped land. Navan Road landfill developed to the east of the subject site starting in the 1970s. Grading/excavation of overburden material on Adre Taillefer property to the northeast is underway as of the 1960s.
2004-Present	Claridge Homes (Carson) Inc.	Vacant undeveloped land	Agricultural or Other Use	Aerial photos and site visit undertaken during this time frame indicate that the subject site is vacant undeveloped land. Placement of fill material of unknown quality on northern portion of the subject site is observed in 2022 aerial photo.

Potentially Contaminating Activities (PCAs) and Areas of Potential Environmental Concern (APECs)

Three on-site PCAs consisting of three former ASTs and the importation of fill material of unknown quality, and one off-site PCA in the form of a landfill on the adjacent property to the east, are considered to result in APECs on the Phase I Property. The PCAs and resulting APECs are presented below.

Table of Areas of Potential Environmental Concern					
Area of Potential Environmental Concern	**Location of Area of Potential Environmental Concern with respect to Phase I Property**	**Potentially Contaminating Activity**	**Location of PCA (on-site or off-site)**	**Contaminants of Potential Concern**	**Media Potentially Impacted (Groundwater, Soil, and/or Sediment)**
APEC 1 Fill Material of Unknown Quality	The central to northern portion of the Phase I Property	PCA 30 – Importation of Fill Material of Unknown Quality	On-site	BTEX PHCs Metals As, Se, Sb PAHs	Soil
APEC 2 Former Aboveground Storage Tank	The northern portion of the Phase I Property	PCA 28 – Gasoline and Associated Products Storage in Fixed Tanks	On-site	BTEX PHCs VOCs	Soil and Groundwater

Table of Areas of Potential Environmental Concern					
Area of Potential Environmental Concern	**Location of Area of Potential Environmental Concern with respect to Phase I Property**	**Potentially Contaminating Activity**	**Location of PCA (on-site or off-site)**	**Contaminants of Potential Concern**	**Media Potentially Impacted (Groundwater, Soil, and/or Sediment)**
APEC 3 Former Aboveground Storage Tank	The northern portion of the Phase I Property	PCA 28 – Gasoline and Associated Products Storage in Fixed Tanks	On-site	BTEX PHCs VOCs	Soil and Groundwater
APEC 4 Potential Impacts from Navan Road Landfill to the East	Eastern portion of the Phase I Property	PCA 58 – Waste Disposal and Waste Management, including landfilling	Off-site	BTEX PHCs VOCs Metals As, Se, Sb Mercury Cr(VI) PAHs	Soil
				BTEX PHCs VOCs Metals As, Se, Sb Mercury Cr(VI) Chloride Cyanide	Groundwater
APEC 5 Potential Impacts from Fill Material of Unknown Quality	The western portion of the Phase I Property	PCA 30 – Importation of Fill Material of Unknown Quality	On-site	BTEX PHCs Metals As, Se, Sb Mercury Cr(VI) PAHs	Soil

Contaminants of Potential Concern

Based on the APECs identified on the Phase I Property, the contaminants of potential concern (CPCs) are:

Soil

- ❒ Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX);
- ❒ Petroleum Hydrocarbons, Fractions F_1 to F_4 (PHCs);
- ❒ Metals;
- ❒ Hydride forming metals (As, Se, Sb);

- ❒ Mercury (Hg);
- ❒ Hexavalent Chromium (Cr(VI));
- ❒ Volatile Organic Compounds (VOCs);
- ❒ Polycyclic Aromatic Hydrocarbons (PAHs);

Groundwater

- ❒ Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX);
- ❒ Petroleum Hydrocarbons, Fractions F_1 to F_4 (PHCs);
- ❒ Metals;
- ❒ Hydride forming metals (As, Se, Sb);
- ❒ Mercury (Hg);
- ❒ Hexavalent Chromium (Cr(VI));
- ❒ Volatile Organic Compounds (VOCs);
- ❒ Chloride;
- ❒ Cyanide.

In addition to the identified CPCs, leachate indicator parameters were analysed as part of the most recently completed Phase II ESA.

7.2 Conceptual Site Model

Geological and Hydrogeological Setting

The Geological Survey of Canada website on the Urban Geology of the National Capital Area was consulted as part of this assessment. Based on the information from NRCAN, bedrock in the area of the site consists of shale, limestone, dolostone and siltstone of the Billings Formation. Based on the maps, both the thickness and composition of the overburden vary across the site. The northern portion of the Phase I Property consists of granular glaciomarine sediments with an overburden of approximately 50 m.

The central portion of the Phase I Property consists of colluvial deposits, and the southern portion of the Phase I Property consists of fine-grained glaciomarine sediments with a drift thickness of approximately 30 m.

Water Bodies

The nearest body of water is the Mer Bleue Bog located 100 m south of the Phase I Property.

Areas of Natural Significance

The Mer Bleue conservation area lies 100 m south of the Phase I Property.

Well Records

A search of the MECP's web site for all drilled well records within 250 m of the Phase I Property was completed as part of this assessment. The search identified two records in the Phase I Study Area.

One record details a domestic water supply well drilled in 1977 to a depth of 45.7m located approximately 220 m east of the Phase I Property.

The second record pertains to the abandonment of a well located at 3225 Navan Road in 2015, located approximately 30 m north of the Phase I Property.

21 monitoring wells have been installed on the Phase I Property during previous subsurface investigations. The depth to the water table was measured between 0.05 to 5.95 m below the existing ground surface.

Bedrock was not encountered during the subsurface investigation as the monitoring wells were advanced to a maximum depth of 11.28 m and were terminated in the native silty clay layer.

Neighbouring Land Use

Neighbouring land use in the Phase I Study Area is primarily residential to the north (across Navan Road) and west, with Navan Landfill to the east and Agricultural Use land, a former rail line, and the Mer Bleue conservation area to the south.

Potentially Contaminating Activities (PCAs) and Areas of Potential Environmental Concern (APECs)

On-site PCAs resulting in APECs on the Phase I Property include three former ASTs and the importation of fill material of unknown quality. One off-site PCA, a landfill on the adjacent property to the east is considered to represent an APEC on the Phase I Property.

PCAs resulting in APECs are presented on Drawing PE4588- 1– Site Plan.

Contaminants of Potential Concern (CPCs)

Based on the APECs identified on the Phase I ESA Property, the contaminants of potential concern (CPCs) are:

Soil

- ❒ Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX);
- ❒ Petroleum Hydrocarbons, Fractions F_1 to F_4 (PHCs);
- ❒ Metals;
- ❒ Hydride forming metals (As, Se, Sb);
- ❒ Mercury (Hg);
- ❒ Hexavalent Chromium (Cr(VI));
- ❒ Volatile Organic Compounds (VOCs);
- ❒ Polycyclic Aromatic Hydrocarbons (PAHs);

Groundwater

- ❒ Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX);
- ❒ Petroleum Hydrocarbons, Fractions F_1 to F_4 (PHCs);
- ❒ Metals;
- ❒ Hydride forming metals (As, Se, Sb);
- ❒ Mercury (Hg);
- ❒ Hexavalent Chromium (Cr(VI));
- ❒ Volatile Organic Compounds (VOCs);
- ❒ Chloride;
- ❒ Cyanide.

In addition to the identified CPCs, leachate indicator parameters were analysed as part of the most recently completed Phase II ESA.

Assessment of Uncertainty and/or Absence of Information

The information available for review as part of the preparation of this Phase I-ESA is considered to be sufficient to conclude that there are four APECs on the Phase I Property. The presence of APECs was confirmed by a variety of independent sources, and as such, the conclusions of this report are not affected by uncertainty which may be present with respect to the individual sources.

8.0 CONCLUSIONS

8.1 Assessment

A Phase I-Environmental Site Assessment (ESA) was carried out for 3252 Navan Road and a contiguous parcel of land referred to as Spring Valley Phase 5, in the City of Ottawa, Ontario. The purpose of the Phase I-ESA was to research the past and current use of the site and study area and to identify environmental concerns with the potential to have impacted the subject property.

The Phase I Property was first developed for residential purposes circa 1945 prior to the conversion of the site to commercial landscaping depot in approximately 1983. The former presence of two diesel AST locations used in conjunction with this activity are on-site PCAs that are considered to result in two APECs on the Phase I Property.

Fill material of unknown quality was identified in the northern half of the Phase I Property during previous investigations. Stockpiles of fill material were also historically present in the western portion of the Phase I Property the origin of which is unknown. The presence of fill material in these locations are on-site PCAs that are considered to result in two APECs on the Phase I Property.

The neighbouring lands have historically consisted primarily of residential use land (dwellings), with landfill operations (industrial use) commencing at 3354 Navan Road around 1965 and continuing to the present day. It should be noted that the landfill does not take domestic waste and solely accepts construction and demolition waste. Off-site landfilling activity is a PCA considered to result in an APEC on the Phase I Property. A railway line was historically present approximately 80 m south of the Phase I Property until it was removed around the mid 1970s. Based on the separation distance, the former rail line is not considered to result in an APEC on the Phase I Property.

Following the historical review, a site visit was conducted. The Phase I Property is being used as a construction site office and for the storage of miscellaneous construction materials, with the remainder consisting of unused former agricultural land.

The neighbouring properties are primarily used for residential purposes with the Navan Road landfill located on the adjacent property to the east, previously discussed. No additional off-site PCAs were identified within the Phase I Study Area.

8.2 Recommendations

Based on the findings of the Phase I-ESA, it is our opinion that **a Phase II-ESA is required for the Phase I Property.** Based on the Phase I Property's former commercial use, a Record of Site Condition (RSC) is required to be filed with the MECP prior to the change in land use to residential use.

Based on the age of the subject building (circa 1945), asbestos-containing materials (ACMs) are potentially present in the subject structure. The potential ACMs observed during the site visit include drywall joint compound and vinyl floor tiles. A Designated Substance Survey (DSS) of the building must be conducted in accordance with Ontario Regulation 278/05, under the Occupational Health and Safety Act, prior to any major renovation or demolition activities.

9.0 STATEMENT OF LIMITATIONS

This Phase I-Environmental Site Assessment (ESA) report has been prepared in general accordance with O.Reg. 153/04 as amended by O.Reg. 269/11 and meets the requirements of CSA Z768-01 (reaffirmed 2022). The conclusions presented herein are based on information gathered from a limited historical review and field inspection program. The findings of the Phase I-ESA are based on a review of readily available geological, historical, and regulatory information and a cursory review made at the time of the field assessment. The historical research relies on information supplied by others, such as, local, provincial, and federal agencies and was limited within the scope-of-work, time and budget of the project herein.

Should any conditions be encountered at the Phase I Property and/or historical information that differ from our findings, we request that we be notified immediately in order to allow for a reassessment.

This report was prepared for the sole use of Claridge Homes. Permission and notification from Claridge Homes and Paterson Group will be required to release this report to any other party.

3. Search Parameters

Search Parameters	Specify Year(s) Requested
Environmental concerns (General correspondence, occurrence reports, abatement)	all
Orders	all
Spills	all
Investigations/prosecutions ► Owner and tenant information must be provided	all
Waste Generator number/classes	all

Files older than 2 years may require $60.00 retrieval cost. There is no guarantee that records responsive to your request will be located.

4. Environmental Compliance Approvals/Certificates of Approval

Environmental Compliance Approvals/Certificates of Approval	SD	Specify Year(s) Requested
air - emissions	☐	all
renewable energy	☐	all
water - mains, treatment, ground level, standpipes & elevated storage, pumping stations (local & booster)	☐	all
sewage - sanitary, storm, treatment, stormwater, leachate & leachate treatment & sewage pump stations	☐	all
waste water - industrial discharge	☐	all
waste sites - disposal, landfill sites, transfer stations, processing sites, incinerator sites	☐	all
waste systems - haulers: sewage, non-hazardous & hazardous waste, mobile waste processing units, PCB destruction	☐	all

Proponent information must be provided and Environmental Compliance Approval/Certificate of Approval number(s) (if known). 1985 and prior records are searched manually. Search fees in excess of $300.00 may be incurred, depending on the types and years to be searched. Specify Approval number(s) (if known). If supporting documents are also required, mark SD box and specify type e.g. maps, plans, reports, etc.

Appendix D-Monitoring and Screening Checklist
General Information and Instructions

General Information: The checklist is to be completed, and submitted with the Monitoring Report.
Instructions: A complete checklist consists of:
(a) a completed and signed checklist, including any additional pages of information which can be attached as needed to provide further details where indicated.
(b) completed contact information for the Competent Environmental Practitioner (CEP)
(c) self-declaration that CEP(s) meet(s) the qualifications as set out below and in Section 1.2 of the Technical Guidance Document.

Definition of Groundwater CEP:
For groundwater, the CEP must have expertise in hydrogeology and meet one of the following:
(a) the person holds a licence, limited licence or temporary licence under the *Professional Engineers Act*; or
(b) the person holds a certificate of registration under the *Professional Geoscientists Act, 2000* and is a practicing member, temporary, member or limited member of the Association of Professional Geoscientists of Ontario. O. Reg. 66/08, s. 2..
Definition of Surface water CEP:
A CEP for surface water assessments is a scientist, professional engineer or professional geoscientist as described in (a) and (b) above with demonstrated experience and post-secondary education, either a diploma or degree, in hydrology, aquatic ecology, limnology, aquatic biology, physical geography with specialization in surface water, and/or water resource management.

The type of scientific work that a CEP performs must be consistent with that person's education and experience. If an individual has appropriate training and credentials in both groundwater and surface water and is responsible for both areas of expertise, the CEP may then complete and validate both sections of the checklist.

Monitoring Report and Site Information	
Waste Disposal Site (WDS) Name	Navan Waste Recycling and Disposal Facility
Location (e.g. street address, lot, concession)	3354 Navan Road. Parts of Lots 2, 3 and 4, Concession IV
GPS Location (taken within the property boundary at front gate/ front entry)	460569.6m E 5030570.0m N (Zone 18)
Municipality	City of Ottawa (formerly City of Gloucester)
Client and/or Site Owner	Waste Connections of Canada
Monitoring Period (Year)	2019
This Monitoring Report is being submitted under the following:	
Environmental Compliance Approval (ECA) Number (formerly "Certificate of Approval" (C of A)) :	No. A460702
Director's Order No.:	N/A
Provincial Officer's Order No.:	N/A

Other:	N/A		
Report Submission Frequency	(•) **Annual** ( ) **Other**	Due March 31	
The site is: **(Operation Status)**	(•) **Open** ( ) **Inactive** ( ) **Closed**		
Is there an active waste transfer station at the site?	( ) **Yes** (•) **No**		
Does this WDS have a Closure Plan?	(•) **Not yet submitted** ( ) **Submitted and under review** ( ) **Submitted and approved**		
Total Approved Capacity	7,600,000 (excl. final cover)	*Units*	Cubic Metres
Maximum Approved Fill Rate	1,500	*Units*	Tonnes per Day
Total Waste Received within Monitoring Period (Year)	222,976	*Units*	Tonnes
Total Waste Received within Monitoring Period (Year) *Describe the methodology used to determine this quantity*	Weighed		
Estimated Remaining Capacity	1,896,722	*Units*	Cubic Metres
Estimated Remaining Capacity *Describe the methodology used to determine this quantity*	Estimation		
Estimated Remaining Capacity *Date Last Determined*	1-Jan-2020		
Non-Hazardous Approved Waste Types	[X] Domestic [X] Industrial, Commercial & Institutional (IC&I) [ ] Source Separated Organics (Green Bin) [ ] Tires	[X] Contaminated Soil [X] Wood Waste [ ] Blue Box Material [ ] Processed Organics [ ] Leaf and Yard Waste	[ ] Food Processing/Preparation Operations Waste [ ] Hauled Sewage Other: Asbestos waste. Petruscible waste are not accepted for landfilling.
Subject Waste Approved Waste Classes: Hazardous & Liquid Industrial *(separate waste classes by comma)*	None		

Year Site Opened *(enter the Calendar Year only)*	1960	**Current ECA Issue Date**	April 16, 2009, not incl. notices
Is your Site required to submit Financial Assurance?		◉ Yes ○ No	
Describe how your WDS is designed.		○ Natural Attenuation only ◉ Fully engineered Facility ○ Partially engineered Facility	
Does your Site have an approved Contaminant Attenuation Zone?		○ Yes ◉ No	
If closed, specify ECA, control or authorizing document closure date:		N/A	
Has the nature of the operations at the site changed during this monitoring period?		○ Yes ◉ No	
If yes, provide details:			

Have any measurements been taken since the last reporting period that indicate landfill gas volumes have exceeded the MOE limits for subsurface or adjacent buildings? (i.e. exceeded the LEL for methane)	○ Yes ◉ No

Groundwater WDS Verification:

Based on all available information about the site and site knowledge, it is my opinion that:

Sampling and Monitoring Program Status:

1) **The monitoring program continues to effectively characterize site conditions and any groundwater discharges from the site. All monitoring wells are confirmed to be in good condition and are secure:**	◉ **Yes** ○ **No**	
2) **All groundwater, leachate and landfill gas sampling and monitoring for the monitoring period being reported on was successfully completed as required by ECA or other relevant authorizing/ control document(s):**	○ **Yes** ◉ **No** ○ **Not Applicable**	If no, list exceptions below or attach information.

Groundwater Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
94-2 and 94-5	Monitoring wells 94-2 and 94-5 were inadvertently excluded during the June 2019 monitoring session.	
MW09-1A, 1B, 1C, and 1D	Those groundwater monitoring locations were not sampled during the winter of 2020 due to historical conditions of frozen water in the monitoring wells. Instead, they were monitored in November 2019. MW09-1A was frozen at the time and no sample was collected at this location.	

3) a) Some or all groundwater, leachate and landfill gas sampling and monitoring requirements have been established or defined outside of a ministry ECA, authorizing, or control document, *or Ministry concurrence.*	○ Yes ◉ No ○ Not Applicable	
b) If yes, the sampling and monitoring identified under 3(a) for the monitoring period being reported on was successfully completed in accordance with established protocols, frequencies, locations, and parameters developed as per the Technical Guidance Document:	○ Yes ○ No ◉ Not Applicable	If no, list exceptions below or attach additional information.

Groundwater Sampling Location	Description/Explanation for change (change in name or location, additions, deletions)	Date

4) **All field work for groundwater investigations was done in accordance with Standard Operating Procedures (SOP) as established/outlined per the Technical Guidance Document (including internal/external QA/QC requirements) (Note: A SOP can be from a published source, developed internally by the site owner's consultant, or adopted by the consultant from another organization):**	○ Yes ◉ No	Golder Associates Ltd. standard practices were followed as described in the report.
Sampling and Monitoring Program Results/WDS Conditions and Assessment:		
5) **The site has an adequate buffer, Contaminant Attenuation Zone (CAZ) and/ or contingency plan in place. Design and operational measures, including the size and configuration of any CAZ, are adequate to prevent potential human health impacts and impairment of the environment.**	◉ Yes ○ No	
6) **The site meets compliance and assessment criteria.**	○ Yes ◉ No	In 2019, only one trigger exceedance of the background range was reported: it was for magnesium at MW92-10, in the weathered clay stratigraphic unit. No other continued increase in concentration for other parameters beyond the background range was reported in 2019 in the sand stratigraphic unit or the weathered clay stratigraphic unit.
7) **The site continues to perform as anticipated. There have been no unusual trends/ changes in measured leachate and groundwater levels or concentrations.**	○ Yes ◉ No	Exceedances of background range were reported at many downgradient monitoring wells for several parameters in 2019. Additional data in the intact clay and glacial till/upper bedrock units to be collected in 2020 is needed to evaluate trends in leachate indicator parameters concentrations in these units.

1) Is one or more of the following risk reduction practices in place at the site: *(a)* There is minimal reliance on natural attenuation of leachate due to the presence of an effective waste liner and active leachate collection/ treatment; or *(b)* There is a predictive monitoring program in-place (modeled indicator concentrations projected over time for key locations); or *(c)* The site meets the following two conditions (typically achieved after 15 years or longer of site operation): *i.*The site has developed stable leachate mound(s) and stable leachate plume geometry/ concentrations; and *ii.*Seasonal and annual water levels and water quality fluctuations are well understood.	◉ Yes ○ No	Note which practice(s):	☒ (a) ☒ (b) ☐ (c)
9) Have trigger values for contingency plans or site remedial actions been exceeded (where they exist):	◉ Yes ○ No ○ Not Applicable	In 2019, only one trigger exceedance of the background range was reported: it was for magnesium at MW92-10, in the weather clay unit. The MECP was informed of this exceedance. WCC intends to maintain low leachate level in the landfill and be proactive in maintaining the leachate forcemain. A spare leachate pump was acquired in 2019 as a contingency.	

Groundwater CEP Declaration:

I am a licensed professional Engineer or a registered professional geoscientist in Ontario with expertise in hydrogeology, as defined in Appendix D under Instructions. Where additional expertise was needed to evaluate the site monitoring data, I have relied on individuals who I believe to be experts in the relevant discipline, who have co-signed the compliance monitoring report or monitoring program status report, and who have provided evidence to me of their credentials.

I have examined the applicable Environmental Compliance Approval and any other environmental authorizing or control documents that apply to the site. I have read and followed, *as deemed appropriate for this site in my professional judgement,* the Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document (MOE, 2010, or as amended), and associated monitoring and sampling guidance documents, as amended from time to time. I have reviewed all of the data collected for the above-referenced site for the monitoring period(s) identified in this checklist. Except as otherwise agreed with the ministry for certain parameters, all of the analytical work has been undertaken by a laboratory which is accredited for the parameters analysed to *ISO/IEC 17025-2005 (E)- General requirements for the competence of testing and calibration laboratories*, or as amended from time to time by the ministry.

If any exceptions or potential concerns have been noted in the questions in the checklist attached to this declaration, it is my opinion that these exceptions and concerns are minor in nature and will be rectified for the next monitoring/reporting period. Where this is not the case, the circumstances concerning the exception or potential concern and my client's proposed action have been documented in writing to the Ministry of the Environment District Manager in a letter from me dated:

Recommendations:

Based on my technical review of the monitoring results for the waste disposal site:

○ **No changes to the monitoring program are recommended**	
◉ **The following change(s) to the monitoring program is/ are recommended:**	Due to on-going inability to collect water samples in monitoring wells MW09-1A through D located in Mer Bleue because of the frozen conditions necessary to access the wells in the winter, efforts will be made to collect a sample during a dry period (i.e., in the summer). It is also proposed to remove VOCs from the list of parameters of the groundwater monitoring program as well as discontinue sediment monitoring (see rationale in Section 9.0).
◉ **No Changes to site design and operation are recommended**	
○ **The following change(s) to the site design and operation is/are recommended:**

Surface Water WDS Verification:

Provide the name of surface water body/bodies potentially receiving the WDS effluent and the approximate distance to the waterbody (including the nearest surface water body/bodies to the site):	
Name (s)	See Attachment A.

Distance(s)	N/A

Based on all available information and site knowledge, it is my opinion that:

Sampling and Monitoring Program Status:

1) **The current surface water monitoring program continues to effectively characterize the surface water conditions, and includes data that relates upstream/background and downstream receiving water conditions:**	(●) Yes ( ) No	
2) **All surface water sampling for the monitoring period being reported was successfully completed in accordance with the ECA or relevant authorizing/control document(s) (if applicable):**	(●) Yes ( ) No ( ) Not applicable	If no, specify below or provide details in an attachment.

Surface Water Sampling Location	Description/Explanation for change (change in name or location, additions, deletions)	Date

3) a) **Some or all surface water sampling and monitoring program requirements for the monitoring period have been established outside of a ministry ECA or authorizing/control document** *, or Ministry concurrence.*	( ) Yes (●) No ( ) Not Applicable	
b) **If yes, all surface water sampling and monitoring identified under 3 (a) was successfully completed in accordance with the established program from the site, including sampling protocols, frequencies, locations and parameters) as developed per the Technical Guidance Document:**	( ) Yes ( ) No (●) Not Applicable	If no, specify below or provide details in an attachment.

Surface Water Sampling Location	Description/Explanation for change (change in name or location, additions, deletions)	Date

4) All field work for surface water investigations was done in accordance with SOP, including internal/external QA/QC requirements, as established/outlined as per the Technical Guidance Document, MOE 2010, or as amended. (Note: A SOP can be from a published source, developed internally by the site owner's consultant, or adopted by the consultant from another organization):	○ Yes ◉ No	Golder Associates Ltd. standard practices were followed as described in the report.

Sampling and Monitoring Program Results/WDS Conditions and Assessment:

5) The receiving water body meets surface water-related compliance criteria and assessment criteria: i.e., there are no exceedances of criteria, based on MOE legislation, regulations, Water Management Policies, Guidelines and Provincial Water Quality Objectives and other assessment criteria (e.g., CWQGs, APVs), as noted in Table A or Table B in the Technical Guidance Document (Section 4.6):	◉ Yes ○ No

If no, list parameters that exceed criteria outlined above and the amount/percentage of the exceedance as per the table on the following page or provide details in an attachment:

Parameter	Compliance or Assessment Criteria or Background	Amount by which Compliance or Assessment Criteria or Background Exceeded
e.g. Nickel	e.g. ECA limit, PWQO, background	e.g. X% above PWQO
6) **In my opinion, any exceedances listed in Question 5 are the result of non-WDS related influences (such as background, road salting, sampling site conditions)?**	(•) Yes ( ) No	There are no exceedances as there is no surface water-related compliance criteria (see question 7).

7) **All monitoring program surface water parameter concentrations fall within a stable or decreasing trend. The site is not characterized by historical ranges of concentrations above assessment and compliance criteria.**	(●) **Yes** ( ) **No**	The WCC Navan Facility is an engineered landfill site. Therefore, an excursion of leachate would be apparent in the underlying stratigraphic units prior to a surface water impact. As such, a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. A site-specific groundwater based trigger mechanism is the appropriate approach for the WCC Navan Facility. The MECP has agreed that this is the preferred approach for the WCC Navan Facility.
8) **For the monitoring program parameters, does the water quality in the groundwater zones adjacent to surface water receivers exceed assessment or compliance criteria (e.g. , PWQOs, CWQGs, or toxicity values for aquatic biota (APVs)):**	( ) Yes ( ) No ( ) Not Known (●) Not Applicable	
9) **Have trigger values for contingency plans or site remedial actions been exceeded (where they exist):**	( ) **Yes** ( ) **No** (●) **Not Applicable**	

Surface Water CEP Declaration:

I, the undersigned hereby declare that I am a Competent Environmental Practitioner as defined in Appendix D under Instructions, holding the necessary level of experience and education to design surface water monitoring and sampling programs, conduct appropriate surface water investigations and interpret the related data as it pertains to the site for this monitoring period.

I have examined the applicable Environmental Compliance Approval and any other environmental authorizing or control documents that apply to the site. I have read and followed, *as deemed appropriate for this site in my professional judgement,* the Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document (MOE, 2010, or as amended), and associated monitoring and sampling guidance documents, as amended from time to time. I have reviewed all of the data collected for the above-referenced site for the monitoring period(s) identified in this checklist. Except as otherwise agreed with the ministry for certain parameters, all of the analytical work has been undertaken by a laboratory which is accredited for the parameters analysed to *ISO/IEC 17025-2005 (E)- General requirements for the competence of testing and calibration laboratories*, or as amended from time to time by the ministry.

If any exceptions or potential concerns have been noted in the questions in the checklist attached to this declaration, it is my opinion that these exceptions and concerns are minor in nature or will be rectified for future monitoring events. Where this is not the case, the circumstances concerning the exception or potential concern and my client's proposed action have been documented in writing to the Ministry of the Environment District Manager in a letter from me dated:

Recommendations:

Based on my technical review of the monitoring results for the waste disposal site:

◉ No Changes to the monitoring program are recommended	
○ The following change(s) to the monitoring program is/are recommended:	
◉ No changes to the site design and operation are recommended	
○ The following change(s) to the site design and operation is/ are recommended:

Attachment A

In the event that leachate-impacted water was to reach either stormwater management ponds or ditches on the site, the source of the impact would be determined and then intercepted, as required. If necessary, the affected pond and/or ditches could then be emptied through a temporary pumping operation and the pumped water could be combined with the leachate and directed for off-site treatment. Therefore, there are no surface water bodies potentially receiving waste disposal site effluent.

Executive Summary

This report serves as the annual environmental monitoring portion of the 2019 site operations and monitoring report and presents the results of groundwater, surface water, leachate and sediment monitoring activities carried out during 2019 at the Waste Connections of Canada (WCC) Navan Waste Recycling and Disposal Facility (the WCC Navan Facility). This report has been prepared to fulfill the reporting requirements outlined in Conditions 135 and 136 of Environmental Compliance Approval (ECA) No. A460702.

The following executive summary highlights key points only; for complete information and findings it is necessary for the reader to examine the complete report.

Based on the groundwater levels obtained during the 2019 monitoring program, no significant change in groundwater flow patterns has been observed.

Groundwater at the WCC Navan Facility is monitored within four stratigraphic units identified as a shallow surface sand layer, an upper weathered clay zone, an intact (un-weathered) deposit of clay and a glacial till/upper bedrock zone. Monitoring wells are present up-gradient, at the down-gradient edge (used to assess compliance) and further down-gradient of the landfill in each of these units.

The hydrogeology of the site indicates a recharge area north of the landfill having a downward groundwater flow component. South of the site, the hydrogeology indicates a typical discharge area having a slight upward groundwater flow component. In general, shallow groundwater quality is variable, but a distinction is noted between groundwater quality up-gradient and down-gradient of the landfill in the weathered clay. Groundwater in the intact clay deposit up-gradient of the landfill is also slightly different from down-gradient groundwater quality. In the glacial till/ upper bedrock groundwater zone, only minor differences exist in the groundwater quality across the site.

The Ministry of the Environment, Conservation and Parks (MECP) has stated that the Reasonable Use Guideline is not applicable at this site. A compliance assessment of groundwater quality was completed using the accepted groundwater and surface water trigger mechanism (Golder, 2007b). The Leachate Indicator Parameters at all groundwater monitoring locations immediately down-gradient from the landfill which are used to assess compliance were graphed and visually checked for exceedances of the 1998 to 2018 background range.

Leachate quality monitoring results for 2019 indicate that leachate generated at the WCC Navan Facility is not significantly different from previous monitoring events. Leachate at the WCC Navan Facility continues to be relatively weak wastewater when compared to municipal landfill leachate.

Trigger concentrations exceedances were reported in 2018. As a result, in accordance with ECA Condition 123 (a), WCC informed the MECP Ottawa District Office of these exceedances in a phone call on March 6, 2019. WCC presented a proposed course of action to address these exceedances and implemented it in 2019, in a continuing effort to achieve a drained state in the leachate collection system.

In 2019, only one trigger exceedance of the background range was reported: it was for magnesium at MW92-10, in the weathered clay stratigraphic unit. No other continued increase in concentration for other parameters beyond the background range was reported in 2019 in the sand stratigraphic unit or the weathered clay stratigraphic unit, due to stabilizing or decreasing concentrations following WCC actions.

In a continuing effort to achieve a drained state in the leachate collection system, WCC intends to proactively maintain the forcemain in good working condition and acquired in 2019 a spare leachate pump to reduce down time when a pump requires servicing. Discharge pumps were already upgraded in the fall of 2011 from 20 horsepower to 35 horsepower in an effort to achieve and maintain a discharge of 17 litres per second. Treatment modifications were commissioned in 2012, increasing pumping capability, which resulted in the ability to maintain the leachate collection system in as much a drained state as possible and to better manage the peak discharge periods. A similar course of action is proposed to be followed in 2020.

Results from the upcoming spring 2020 monitoring session will be analyzed to determine if the effect of these actions are detected in groundwater quality with a decrease in concentrations of Leachate Indicator Parameters at trigger locations, including in the intact clay and glacial till/upper bedrock units. At that point, the need for a formal contingency plan will be assessed in collaboration with the MECP.

The Mer Bleue Bog is located immediately south of the site. Surface water samples are collected in the drainage course to the east, the west and in the perimeter of the Mer Bleue Bog. Surface water data at the WCC Navan Facility is variable over time and the Mer Bleue Bog surface water quality is poor. The WCC Navan Facility is an engineered landfill site; therefore, an excursion of leachate would be apparent in the underlying stratigraphic units prior to a surface water impact. As such, a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. A site-specific groundwater based trigger mechanism is the appropriate approach for the WCC Navan Facility.

Sediment samples were collected at three locations within the Mer Bleue Bog as per an agreement with the National Capital Commission (NCC). In general, parameter concentrations measured in the sediment were similar to previously reported concentrations.

The peat deposit in the Mer Bleue Bog predates any human activity in the area. Having filtered hundreds of years of surface runoff water into the perimeter portion of the bog, it should not be surprising to find contaminants in this natural sink.

The proposed 2020 Environmental Monitoring Program is the same as was conducted in 2019, with the exception of VOCs which are proposed to be removed from the groundwater monitoring program and sediment monitoring which is proposed to be discontinued (see Section 9.0). As per Condition 109 of the ECA No. A460702, the monitoring wells located in borehole 09-1 will be sampled once per year to assess the groundwater quality in the Mer Bleue. However, due to the on-going inability to collect water samples because of the frozen conditions necessary to access the wells in the winter, efforts will be made to collect a sample during a dry period (i.e., in the summer) as has been done between 2014 and 2018 (due to dry conditions in the summer of 2019, they were sampled in the fall where possible).

Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected during the November 2018 monitoring session and will be monitored again in the spring of 2020.

1.0 INTRODUCTION

This report serves as the 2019 annual monitoring report and presents the results of monitoring activities carried out during 2019 at the Waste Connections of Canada (WCC) Navan Waste Recycling and Disposal Facility (the WCC Navan Facility).

The WCC Navan Facility is a 91.87 hectare (ha) waste management facility that includes a 40 ha landfill, as well as processing (recycling). The site is located on parts of Lots 2, 3 and 4, of Concession IV, Ottawa Front in the City of Ottawa (formerly the city of Gloucester), Ontario (see Key Plan, Figure 1). This site has been in operation since 1960 and operates under Environmental Compliance Approval (ECA) No. A460702. In April 2009, WCC received *Environmental Protection Act* approval for the expansion of the WCC Navan Facility.

The monitoring program undertaken in 2019 by Golder Associates Ltd. (Golder) is outlined in Tables 1a through 1c. Monitoring to date at the WCC Navan Facility consists of water quality analysis of surface water, groundwater and leachate. The 2019 monitoring program was a continuation of the monitoring program carried out in 2018 and followed the program outlined in Conditions 109 and 112 of ECA No. A460702 and Condition 10.1 of the Conditions of Environmental Assessment Approval. As per Condition 109 of ECA No. A460702, the monitoring program includes sampling of the monitoring wells located in BH09-1, in order to assess the groundwater quality in the Mer Bleue Bog. The original monitoring program indicated that the wells would be sampled during the winter, when the Mer Bleue Bog is frozen and the wells are accessible. However, the groundwater in the monitoring wells has frequently been frozen during these events. In the 2013 monitoring report (Golder, 2014), it was proposed to sample them during the summer, rather than winter, and this recommendation has carried forward to present. Due to dry conditions in the vicinity of the Mer Bleue Bog, groundwater samples were instead successfully collected at monitoring well MW09-1B, MW09-C, and MW09-D on November 14, 2019 (no sample was collected from monitoring well MW09-1A in November due to frozen conditions).

In addition, sediment quality monitoring which started in 2000 at the request of the National Capital Commission (NCC) at three locations within the Mer Bleue Bog is also documented in this report. Results of landfill gas, noise and odour monitoring undertaken in 2019 are provided under separate covers in Attachments 2 and 3.

A site inspection was conducted by the MECP at the site on September 12, 2019. No non-compliance issues were identified at the time of the inspection. A copy of the inspection report is provided in Appendix H.

2.0 FIELD PROCEDURES

2.1 Objectives

The objectives of the 2019 water quality monitoring program were:

- to comply with the annual monitoring and reporting requirements stipulated in Conditions 109, 112, 135 and 136 of ECA No. A460702
- to assess any potential impacts on water quality at the site resulting from landfill operations
- to continue the monitoring of water quality for key parameters at target locations up-gradient and down-gradient from the landfill
- to document the chemical composition of groundwater and surface water in the vicinity of the landfill
- to assess site compliance with site specific trigger levels relating to groundwater impacts due to leachate
- to document the chemical composition of sediment in the Mer Bleue Bog

2.2 Environmental Monitoring Program

2.2.1 Groundwater Component

The 2019 groundwater monitoring program followed the program outlined in Conditions 109 and 112 of ECA No. A460702 and satisfies objectives listed above. Water quality monitoring at the WCC Navan Facility was initiated in 1981. Since 1991, semi-annual monitoring programs were undertaken. Observation wells were added in 1992, 1994, 1995, 1998, 2000, 2005, 2007, 2009, 2010 and 2011. Groundwater monitoring sessions were carried out on June 19 and November 20-21, 2019. The groundwater monitors are outlined in Tables 1a, 1b and 1c and illustrated on the Site Plan (Figure 2). Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected in November 2018. The monitoring wells screened in the intact clay deposit and in the glacial till/upper bedrock zone will be sampled again in the spring of 2020.

The approved groundwater monitoring program was followed, except that as discussed in Section 1.0, groundwater monitoring locations BH09-1A, BH09-1B, BH09-1C and BH09-1D were not sampled during the winter of 2020 due to historical conditions of frozen water in the monitoring wells. Due to dry conditions in the summer, monitoring wells BH09-1B, BH09-1C, and BH09-1D were sampled instead during the fall session on November 21, 2019 (monitoring well BH09-1A was frozen and therefore no sample could be collected at the time). In addition, monitoring wells OW-94-2 and OW-94-5 were inadvertently confused with two other wells that were not part of the monitoring program and no samples were collected in the spring at these locations.

Detailed logs of the subsurface conditions encountered in each borehole are provided on the Record of Borehole sheets in Appendix A for most of the groundwater monitors included in the 2019 groundwater monitoring program. The top of pipe and ground surface elevations at each groundwater monitor location were surveyed with reference to geodetic datum following completion of the corresponding borehole drilling and groundwater installation program. The top of pipe for each of the monitoring wells included in the groundwater monitoring program were re-surveyed by WCC during November 2011 to account for any movement of the monitors over time.

The groundwater levels in the monitors included in the sampling sessions were measured on June 13, 2019 and November 14, 2019.

All monitors sampled during 2019 were developed through the removal of at least one standing volume of water using dedicated samplers which have been provided in each groundwater monitor. Sampling of groundwater was generally performed one week after monitor development, because the wells recover slowly.

As part of the Quality Assurance/Quality Control (QA/QC) program, a total of 3 field groundwater samples duplicates were prepared (2 in the spring and 1 in the fall) along with one field blank and one trip blank prepared during the fall sampling session.

The temperature, pH and electrical conductivity of the groundwater samples were measured in the field at the time of sample collection. All field instruments were calibrated in the field prior to use. All samples collected were entered on a Chain of Custody Form and placed in coolers with ice packs until they were delivered in person to a private certified analytical laboratory. Parameters analysed for this reporting period are listed in Table 2. The sample preparation and preservation protocol provided below was followed for the groundwater samples.

Analytical Parameters	Preparation and Preservation Protocols
arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese and zinc	plastic bottle, field filtered to 0.45 microns and preserved to pH<2 with nitric acid
total dissolved solids (TDS), alkalinity, sulphate, nitrate, nitrite, chloride, bicarbonate, carbonate, hardness (calcium and magnesium), potassium and sodium	plastic bottle, unfiltered and unpreserved
ammonia, total phosphorus, phenols, COD and TKN*	amber glass bottle, unfiltered and preserved to pH<2 with sulphuric acid
benzene, toluene, ethylbenzene, m/p-xylene, o-xylene, 1,1-dichloroethane, methylene chloride and vinyl chloride	amber glass septum vial with no headspace, unfiltered and preserved to pH<2 with sodium bisulphate

Notes: * Organic nitrogen calculated based on laboratory ammonia and TKN concentrations.

Paracel Laboratories Ltd. (Paracel) in Ottawa, Ontario performed all laboratory chemical and physical analyses on the groundwater samples. The Report of Analyses sheets from Paracel are provided in Appendix B. The reportable detection limits (RDLs) for the specific groundwater analyses were generally commensurate with the standards established in the Ontario Drinking Water Quality Standards, Objectives and Guidelines (referred to as ODWQS, MOE, 2006, revised January 1, 2018).

2.2.2 Leachate Component

The leachate monitoring program followed the program outlined in Conditions 109 and 112 of ECA No. A460702. Leachate quality analysis was undertaken on samples obtained from the pump station (L5) during the June 20, August 28 and November 21 monitoring sessions as outlined in Tables 1a through 1c. The location of the leachate monitor is illustrated on the Site Plan (Figure 2).

As part of the QA/QC program, one field blank and one trip blank for the volatile organic compounds (VOCs) was prepared during the August sampling session.

The temperature, pH, electrical conductivity and dissolved oxygen of the collected leachate samples were measured in the field at the time of sample collection. All field instruments were calibrated in the field prior to use. All leachate samples were entered on a Chain of Custody Form and placed in coolers with ice packs until they were delivered in person to a private analytical laboratory. Parameters analysed for this reporting period are listed in Table 2.

The sample preparation and preservation protocol outlined below was followed for the leachate samples.

Analytical Parameters	Preparation and Preservation Protocols
arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese and zinc	plastic bottle, field filtered to 0.45 microns and preserved to pH<2 with nitric acid
TDS, alkalinity, sulphate, nitrate, nitrite, chloride, total suspended solids (TSS), biochemical oxygen demand (BOD), hardness (calcium and magnesium), potassium and sodium	plastic bottle, unfiltered and unpreserved
ammonia, total phosphorus, phenols, COD and TKN*	amber glass, unfiltered and preserved to pH<2 with sulphuric acid
dissolved inorganic carbon (DIC)**, dissolved organic carbon (DOC)	amber glass bottle, unfiltered and preserved to pH<2 with sulphuric acid
benzene, toluene, ethylbenzene, m/p-xylene, o-xylene, 1,1-dichloroethane, methylene chloride and vinyl chloride	amber glass septum vial with no headspace, unfiltered and preserved to pH<2 with sodium bisulphate

Notes:
* Organic nitrogen calculated based on laboratory ammonia and TKN concentrations.
** Dissolved inorganic carbon (DIC) calculated based on laboratory dissolved organic carbon (DOC) and total dissolved carbon

Paracel performed all laboratory chemical and physical analyses on the leachate samples. The Report of Analyses sheets from Paracel are provided in Appendix B. The RDLs for the specific leachate analyses were commensurate with the standards established in the ODWQS (MOE, 2006, revised January 1, 2018).

2.2.3 Surface Water

The 2019 surface water monitoring program followed the program outlined in Condition 109 of ECA No. A460702. The 2019 surface water monitoring program is outlined in Tables 1a through 1c and monitoring stations are illustrated on Figure 2. Surface water samples were obtained on June 20, August 28, and November 21, 2019.

The only deviations from the approved surface water monitoring program were due to dry or stagnant conditions. Surface water monitoring stations S5, S8, S9, S10, and S11 were not sampled in August 2019 and station S5 in June and November 2019.

The estimation of surface water flow was obtained concurrently with surface water sampling on June 20, August 28 and November 21, 2019.

One field duplicate was prepared during the June and November sampling sessions as part of the QA/QC program.

The temperature, pH, electrical conductivity and dissolved oxygen of the surface water samples were measured in the field at the time of sample collection. All field instruments were calibrated in the field prior to use. All samples collected were entered on a Chain of Custody Form and placed in coolers with ice packs until they were delivered in person to a private analytical laboratory. Parameters analysed for this reporting period are listed in Table 2. The same preparation and preservation protocol below was followed for each of the surface water samples.

Analytical Parameters	Preparation and Preservation Protocols
arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese and zinc	plastic bottle, unfiltered and preserved to pH<2 with nitric acid
TDS, alkalinity, sulphate, nitrate, nitrite, chloride, TSS, BOD, dissolved organic carbon (DOC), hardness (calcium and magnesium), potassium and sodium	plastic bottle, unfiltered and unpreserved
ammonia*, total phosphorus, phenols, COD and TKN	amber glass bottle, unfiltered and preserved to pH<2 with sulphuric acid
dissolved inorganic carbon (DIC)	amber glass bottle, unfiltered and unpreserved

Notes: * Unionized ammonia calculated based on laboratory ammonia concentration, field temperature and pH measurements.

Paracel performed all laboratory chemical and physical analyses on the surface water samples. The Report of Analyses sheets from Paracel are provided in Appendix B. The RDLs for the specific surface water analyses were generally commensurate with the standards established in the Provincial Water Quality Objectives (referred to as PWQO, MOE, 1994, reprinted 1999).

2.3 Sediments

Sediment quality was monitored at three locations within the Mer Bleue Bog. The sampling locations are the same as the surface water sampling stations located within the bog, i.e., SED-W was obtained at SW-W, SED-C at SW-C and SED-E at SW-E (refer to Figure 2). Sediment quality monitoring in the Mer Bleue Bog was added to the monitoring program in 2000 and sediment samples were obtained in 2019 at three locations on June 20 and November 21.

All samples collected were entered on a Chain of Custody Form and placed in coolers with ice packs until they were delivered in person to a private analytical laboratory. Parameters analysed for this reporting period are listed in Table 2. The sample preparation and preservation protocol outlined below was followed for the sediment samples.

Analytical Parameters	Preparation and Preservation Protocols
arsenic, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium and zinc	glass jar, with a plastic lid

Paracel performed all laboratory chemical and physical analyses on the sediment samples. The Report of Analyses sheets from Paracel are provided in Appendix B.

2.4 Status of Monitoring Well Network

During the spring monitoring session, the condition of each well within the monitoring well network at the site was assessed. A summary of the findings of the 2019 monitoring well network condition survey (properly cased, capped and locked) are provided in Table 3. At the time of the condition survey it was observed that all monitoring wells were in good condition noting that MW05-1D could use some new tubing.

3.0 WATER LEVEL DATA

3.1 Groundwater Levels

Records of monitoring well water elevations obtained in June and November 2019 are provided in Tables C-1 and C-2, Appendix C and are shown graphically on Figures C1 through C10. Water level changes for 2019 are discussed in the following sub-sections. It should be noted that all of the monitoring wells were resurveyed in 2011 which resulted in an increase in water elevations at some locations. This is a reflection of the more accurate survey data and does not necessarily reflect changes in the groundwater elevations.

3.1.1 Up-Gradient Control Wells

The results of water levels measured at the up-gradient wells are shown graphically on Figure C1 through Figure C4 in Appendix C. There are no significant changes indicated in groundwater levels measured at these locations. The results indicate the shallow water table to be typically located approximately 1 to 2 metres (m) below ground surface at up-gradient wells OW-92-12 to OW-92-19 and MW05-1A to MW05-1D. The unusually elevated ground water level recorded in November 2017 at monitoring location OW-92-15, returned to levels similar historical levels during the 2018 monitoring program. There are only small fluctuations in water levels indicated for recent years.

Hydraulic head profiles for monitoring wells OW-92-12 to OW-92-19 for June and November 2019 are shown on Figure 3 illustrating a downward hydraulic gradient. The only variation in the direction of the hydraulic gradient is indicated in the upper 5.6 m to 10.4 m below ground surface in the spring and fall, from a downward gradient to an upward gradient in the weathered clay. This result may be attributed to a perched water table at the interface of the weathered clay and the intact clay. The relatively weak downward gradient from the sand to the weathered clay suggests a hydraulic interconnection between these units. The downward gradient is quite pronounced from the weathered clay down to the lower reaches of the intact clay deposit. It is interpreted that the intact clay deposit at depth beneath the landfill site acts as a barrier to groundwater flow.

3.1.2 Immediate Down-Gradient Wells and Wells in Line with Immediate Down-Gradient Wells

The results of the water levels measured at the large down-gradient nest of observation wells (OW-92-1 to OW-92-8 and MW05-8) are shown graphically on Figure C5 provided in Appendix C. These results indicate the shallow groundwater table lies within the sand deposit close to the original ground surface ranging in elevation from about 68.58 m to 71.46 m. Similar results are indicated at observation wells OW-92-9 to OW-92-11 and MW05-11 as well as OW-94-1 to OW-94-3 and MW05-R3 as shown graphically on Figures C6 and C7, respectively. Seasonal variations of nearly 1 m have previously been indicated. The high water levels generally occur during the wet spring whereas the lower water levels are recorded during the dry summer months and fall. Similar trends were observed in 2019 at most wells, with the higher spring elevations being more pronounced in the spring of 2019 (although not as much as in 2018).

Hydraulic head profiles for the nest of observation wells OW-92-1 to OW-92-8 are presented on Figure 3. Unlike the up-gradient groundwater level profiles, the down-gradient profiles historically have indicated a slight upward vertical gradient and a localized weak downward gradient observed at times between the upper 6.3 m to 7.6 m within the weathered clay. Similarly to 2018, a slight downward gradient is observed from the sand to the weathered clay in 2019. The upper four wells historically have appeared to be hydraulically connected with near vertical or hydrostatic water level profiles. A slight upward gradient from the bedrock to the weathered clay at the down-gradient boundary of the landfill would suggest there is upward vertical flow at this location, which would retard the potential for leachate migration into the deeper groundwater system. In the spring of 2019, there was near vertical or a hydrostatic water level profile between the bedrock and weathered clay.

3.1.3 Mer Bleue/Down-Gradient Control Wells

Water levels obtained at the down-gradient control wells are shown graphically on Figures C8, C9 and C10 in Appendix C. These results indicate artesian conditions at OW-94-4 to OW-94-6, OW-95-5 to OW-95-7 and OW-95-9, while at OW-95-1 to OW-95-3, the shallow groundwater table is close to the ground surface within the upper sand, weathered and intact clay. The water level measured at monitoring well OW-94-4 in November 2019 was lower than recent historical data (by 0.42 m), but similar to water levels typically measured in this monitor prior to 2012.

Hydraulic head profiles for the nest of observation wells OW-95-5 to 95-7 and OW-95-9, as shown on Figure 3, illustrate an upward gradient through most of the profile with a weak downward gradient from the sand to the weathered clay. It is noted that no water level could be recorded at OW-95-9 in November 2019 due to frozen conditions. Historically, there has been an upward gradient through the entire profile. The presence of an upward gradient suggests upward groundwater flow is occurring south of the landfill. These results may also suggest upward leaching of porewater from the Champlain Sea clay, a brackish water deposit, may be occurring at the southern boundary of the landfill. North of the landfill, downward leaching of the clay porewater is indicated.

3.1.4 Horizontal Hydraulic Gradients

The horizontal hydraulic gradient in the shallow sand deposit and weathered clay at this site is consistent with the relief of the property which changes in elevation by approximately 15 m to 18 m between the up-gradient and down-gradient boundaries of the landfill. Since the shallow water table appears to be a reflection of the original surface topography, horizontal hydraulic gradients are expected to vary between 0.007 in the plateau above the escarpment and 0.014 in the valley below. Water levels measured south of the landfill indicate shallow groundwater is flowing in a south to southwest direction with a small hydraulic gradient ranging between 0.005 and 0.025. The horizontal gradients in the bog area are influenced by seasonal fluctuations in the surface water levels. Hydraulic gradients could also be influenced by the leachate collection system (LCS) located along the south toe of the landfill. Keeping the LCS drained could result in a lowering of the water table at the southeast corner of the landfill by more than 3 m below the original grade at the southeast corner of the landfill and by 2 m at the southwest corner. This water table lowering could significantly influence the hydraulic gradients within the waste pile near the landfill's south boundary. A clay cut-off wall on the down-gradient side of the LCS was constructed to alleviate any potential problems related to lowering of the groundwater table south of the landfill.

Water levels measured in the up-gradient and down-gradient deep wells (OW-92-12 and OW-95-9) indicate a typical difference in water levels of about 6 m, which represents a hydraulic gradient of approximately 0.01 (0.007 in spring 2019) across the site within the glacial till/upper bedrock.

Many factors, such as mounding within the waste pile, the installation of the leachate collection system and the construction of waste cells with under drainage will influence the rate of groundwater flow across the site.

3.2 Surface Water Flow Measurements

Estimates of surface water flow measurements for 2019 are summarised below along with the historical minimum and maximum flow rates estimated at each monitoring station.

Monitoring Station	Minimum Flow L/s	Maximum Flow L/s	Expected Dry Weather Flow L/s	Estimated Flow June 20, 2019 L/s	Estimated Flow Aug. 28, 2019 L/s	Estimated Flow Nov. 21, 2019 L/s
S-1	No flow	73	0.5 – 2	0.5	0.9	0.9
S-3	No flow	140	<0.5	0.3	No flow	No flow
S-5	No flow	No flow	No flow	Dry	Dry	Dry
S-8	No flow	5 – 10	0.5 – 2	No flow	Dry	No flow
S-9	No flow	94	2 – 5	3.3	Dry	Flow[b]
S-10 (SW-W)[a]	No flow	No flow	No flow	No flow	Dry	No flow
S-11 (SW-C)[a]	No flow	No flow	No flow	No flow	Dry	No flow
S-12 (SW-E)[a]	No flow	No flow	No flow	No flow	No flow	No flow
S-15	No flow	120	0.3 – 2	2.5	1.4	1.0
S-16	No flow	56	No flow	8.3	No flow	No flow
S-17	No flow	44	0.5 – 2	2.3	0.6	2.0

Notes:
[a] Monitoring stations S-10 (SW-W), S-11 (SW-C) and S-12 (SW-E) are located at the northern edge of the Mer Bleue Bog and consist of stagnant bog water.
[b] Flow was observed to be present at surface water monitoring station S-9 during the fall monitoring session but could not be measured due to the presence of ice.

Input: ETB
Checked: RPM

4.0 GROUNDWATER QUALITY ASSESSMENT

Groundwater has been monitored at observation wells since 1981. However, since 1985, landfilling operations expanded over the original down-gradient observation wells which have since been replaced with the existing wells. Existing observation wells were installed in 1992, 1994, 1995, 1998, 2005, 2007, 2009, 2010 and 2011.

Groundwater at the WCC Navan Facility is monitored within four stratigraphic units identified as follows:

- a shallow surface sand layer at depths ranging from 1.5 to 2.5 m below original grade
- the weathered clay zone of a thick clay deposit at depths ranging from 3.5 to 4.5 m below original grade
- the intact clay deposit at depths ranging from 7 to 8 m below original grade
- glacial till/bedrock contact zone at depths ranging from 22.3 to 37.1 m below original grade

The two upper stratigraphic units, the sand and weathered clay units, were sampled for both the June and November monitoring events. The two lower stratigraphic units, the intact clay and near bedrock units, are sampled every 18 months. Groundwater samples from these units were collected in November 2018 and the next sampling session for the monitoring wells screened in these units will be in the spring of 2020. The observation wells monitored in 2019 are listed in Tables 1a, 1b and 1c and illustrated on Figure 2.

As previously discussed, Condition 109 of the ECA requires groundwater monitoring locations MW09-1A, MW09-1B, MW09-1C and MW09-1D to be sampled once per year. Due to expected frozen conditions in the winter, MW09-1A, MW09-1B, MW09-1C and MW09-D have been monitored during the summer sessions starting in 2014. Due to dry conditions in the summer of 2019, these monitoring wells were monitored during the fall session instead. As indicated earlier, due to frozen conditions, no sample could be collected from monitoring well MW09-1A in November 2019. Data from these wells is being collected to assess the groundwater quality in the area of the Mer Bleue as part of the expansion of the landfill.

Current and historical analytical results for groundwater in all units are presented in Appendix D.

4.1 Quality Assurance/Quality Control

The 2019 QA/QC protocol included the following: (i) preparation of one laboratory trip blank and one field blank for the November 2019 monitoring session to be analyzed for VOCs; (ii) the collection and analysis of two blind groundwater sample duplicates for the June 2019 sampling session and (iii) one blind groundwater sample duplicate for the November 2019 sampling session. In addition, the laboratory performs equipment blanks as an internal method of QA/QC.

Analytical results on blind sample duplicates are deemed to be outside of acceptable tolerance limits if the relative percent difference (RPD) between the original sample and its duplicate is greater than 50% when both analytical results are between 10 and 20 times the RDL or if the RPD is greater than 30% when both analytical results are greater than 20 times the RDL.

All QA/QC results for groundwater were within acceptable tolerance limits during the June 2019 monitoring session, except for the potassium concentration in the sample collected from MW-05-1D (identified as 05-1D in the laboratory report) and its duplicate (identified as Dupe-2 in the laboratory report). The sample collected at MW-05-1D in June 2019 and its duplicate had potassium concentrations consistent with historical results.

One blind groundwater sample duplicate was analyzed during the November 2019 session. All QA/QC results for groundwater were within acceptable tolerance limits during the November 2019 monitoring session except for the copper concentration in the sample collected from MW-95-8 (identified as 95-8 in the laboratory report) and its duplicated (identified as Dupe-3 in the laboratory report). The sample collected at MW-95-8 and its duplicate were re-analyzed by the laboratory and deemed the QC to be acceptable for both samples. Copper concentrations are consistent with historical results for both MW-95-8 and its duplicate.

It is believed that the discrepancies noted should not affect the interpretation of the groundwater results.

The results of the VOCs analyses of the field blank and trip blank (identified respectively as Field Blank and Trip Blank in the laboratory report from the November 2019 monitoring session) were within acceptable tolerance limits with all parameters concentrations below their respective RDL.

4.2 Up-Gradient Control Wells

Monitoring of groundwater quality up-gradient from the site was made possible with the use of observation wells installed in 1992 behind the WCC administration office at 3354 Navan Road (OW-92-12 to OW-92-19). In 1995, two additional wells were installed within the shallow sand deposit to the northeast (OW-95-4) and northwest (OW-95-8). Four additional wells were installed in the fall of 1998 at the up-gradient corners of the waste footprint (OW-98-1 to 98-4). In August 2011, a borehole was drilled and a new observation well was installed to replace OW-98-2 in the intact clay deposit, as it was filled with sand. Monitoring wells OW-95-4, OW-98-4 and OW-98-3 were decommissioned in 2012 and replaced by existing monitoring wells MW05-1A to D as per Item 42 listed in Schedule A of ECA No. A460702. All these wells are referred to as the up-gradient control wells. The up-gradient groundwater quality in each stratigraphic unit was compared to the ODWQS for which aesthetic objectives or maximum or interim maximum acceptable concentrations exist.

4.2.1 Sand Layer

The background groundwater quality within the sand layer was monitored during the 2019 groundwater monitoring program through the inclusion of up-gradient monitors OW-92-19, MW05-1D (replacing OW-95-4) and OW-95-8.

The groundwater quality during 2019 at the sand layer groundwater monitors met the ODWQS for all parameters analyzed with the exception of the following:

Groundwater Monitor	Parameter(s) Exceeding ODWQS During June 2019 Monitoring Session	Parameter(s) Exceeding ODWQS During November 2019 Monitoring Session
92-19	[None]	Manganese and TDS
05-1D	Chloride, TDS, sodium	Chloride, TDS
95-8	Manganese and TDS	Iron, Manganese and TDS

Input: ETB
Checked: RPM

As apparent from the above table and historical data, the groundwater quality within the sand layer is characterized by concentrations of chloride, manganese, iron, sodium and TDS, which exceed the ODWQS.

4.2.2 Weathered Clay Deposit

The background groundwater quality within the weathered clay deposit was monitored during the 2019 groundwater monitoring program through the inclusion of up-gradient monitors OW-92-18, OW-98-1 and MW05-1C (replacing OW-98-4).

The groundwater quality during 2019 at the weathered clay deposit groundwater monitors met the ODWQS for all parameters analyzed with the exception of the following:

Groundwater Monitor	Parameter(s) Exceeding ODWQS During June 2019 Monitoring Session	Parameter(s) Exceeding ODWQS During November 2019 Monitoring Session
92-18	Chloride and TDS	Chloride, manganese and TDS
98-1	Chloride, iron, manganese, sodium and TDS	Chloride, iron, manganese, sodium and TDS
05-1C	[None]	Iron and manganese

Input: ETB
Checked: RPM

As apparent from the above table and historical data, the groundwater quality within the weathered clay deposit is characterized by concentrations of chloride, iron, manganese, sodium and TDS, which exceed the ODWQS.

000052

4.3 Mer Bleue/Down-Gradient Control Wells

Groundwater further down-gradient from the landfill is monitored with the use of nested observation wells installed in 1994 and 1995 south of the landfill at the northern edge of the Mer Bleue Bog. These observation wells were installed to obtain a better understanding of the hydrogeology of the area and geochemistry of the groundwater south of the landfill. The nested wells are located in line with the eastern limits of the landfill (OW-94-4, OW-94-5 and OW-94-6), east of the landfill centre line (OW-95-5, OW-95-6, OW-95-7 and OW-95-9) and in line with the western limits of the existing landfill (OW-95-1, OW-95-2 and OW-95-3). All these wells are referred to as the down-gradient control wells. The groundwater quality of the down-gradient control wells in each stratigraphic unit was compared to the ODWQS for aesthetic objectives or maximum or interim maximum acceptable concentrations.

4.3.1 Sand Layer

The down-gradient groundwater quality within the sand layer was monitored during the 2019 groundwater monitoring program through the inclusion of down-gradient monitors OW-94-6, OW-95-3, OW-95-7.

The groundwater quality during 2019 at the sand layer groundwater monitors met the ODWQS for all parameters analyzed with the exception of the following:

Groundwater Monitor	Parameter(s) Exceeding ODWQS During June 2019 Monitoring Session	Parameter(s) Exceeding ODWQS During November 2019 Monitoring Session
94-6	Chloride, manganese, sodium, temperature and TDS	Chloride, iron, manganese, sodium and TDS
95-3	Manganese, sodium and TDS	Manganese, sodium and TDS
95-7	Chloride, iron, manganese, sodium and TDS	Chloride, iron, manganese, sodium and TDS

Input: ETB
Checked: RPM

As apparent from the above table and historical data, the groundwater quality within the sand layer is characterized by concentrations of chloride, iron, manganese, sodium and TDS which exceed the ODWQS. Similar ODWQS exceedances for these parameters were also observed in the up-gradient groundwater at similar concentrations.

4.3.2 Weathered Clay Deposit

The down-gradient groundwater quality within the weathered clay deposit was monitored during the 2019 groundwater monitoring program through the inclusion of down-gradient monitors OW-94-5, OW-95-2 and OW-95-6.

The groundwater quality during 2019 at the weathered clay deposit groundwater monitors met the ODWQS for all parameters analyzed with the exception of the following:

Groundwater Monitor	Parameter(s) Exceeding ODWQS During June 2019 Monitoring Session	Parameter(s) Exceeding ODWQS During November 2019 Monitoring Session
94-5	[Not available][1]	Chloride, manganese, sodium and TDS
95-2	Chloride, sodium and TDS	Chloride, manganese, sodium and TDS
95-6	Chloride, manganese, sodium and TDS	Chloride, manganese, sodium and TDS

Note: [1] Sampling was inadvertently excluded during the spring monitoring session at monitoring well 94-5.

Input: ETB
Checked: RPM

000053

As apparent from the above table and historical data, the groundwater quality within the weathered clay deposit is characterized by concentrations of chloride, manganese, sodium and TDS which exceed the ODWQS, similarly to groundwater quality within the same deposit upgradient of the landfill. The groundwater quality within the weathered clay deposit also has occasional ODWQS exceedances of iron.

4.4 Results

Piper trilinear diagrams for groundwater in the sand layer during June and November 2019 are shown on Figures 4 and 5, respectively. The diagrams indicate that shallow groundwater at the immediately down-gradient locations is somewhat variable and has a geochemical fingerprint between the up-gradient groundwater quality and the groundwater in the sand within the Mer Bleue Bog. Similar to past observations, the distribution of up-gradient groundwater quality on the Piper diagrams is reflecting elevated but stable chloride and hardness (calcium and magnesium) concentrations at MW05-1D since 2012.

Figures 6 and 7 indicate that groundwater in the weathered clay at the immediately down-gradient site OW-92-10 has a geochemical fingerprint between the up-gradient groundwater quality and the groundwater in the weathered clay within the Mer Bleue Bog. Groundwater at other compliance sites is more like groundwater in the weathered clay within the Mer Bleue Bog. These diagrams also indicate that groundwater in the weathered clay deposit up-gradient of the landfill is different from groundwater in the bog. There are no significant changes from the previous year.

A Phase II Environmental Site Assessment was conducted at the landfill by Intera (Intera, 2003). This assessment concluded that groundwater within the sand layer, the upper weathered clay and perhaps the deeper intact clay deposit on down-gradient lands has slightly elevated concentrations of parameters previously thought to be indicative of landfill leachate (e.g., boron, ammonia, TKN). However, there is no obvious spatial correlation of these parameters with proximity to the landfill or groundwater migration pathway. The lack of spatial correlation suggests that groundwater on down-gradient lands is representative of naturally elevated background groundwater quality associated with the Mer Bleue environment.

In addition, the groundwater and surface water trigger mechanism report prepared by Golder (Golder, 2007b) demonstrates a clear difference between up-gradient (north) and south property boundary water quality on the east side of the property, where there are not potential impacts from landfill activities. Naturally elevated parameters measured included boron, copper, iron, arsenic, lead, sodium, alkalinity, bicarbonate, TDS, COD and chloride.

5.0 LEACHATE CHARACTERISTICS

Prior to the construction of the leachate collection system (LCS) in 1991-1992, leachate was sampled and analysed in areas where surface breakout was observed. Breakout of leachate, when encountered, usually occurred at the down-gradient toe of the landfill.

The monitoring program for leachate quality has focused on the LCS. For the purpose of the annual monitoring report, leachate generated by the landfill is monitored at the down-gradient end of the south toe collector at L5 at the same time surface water is monitored. A more extensive leachate monitoring program is carried out throughout the year in accordance with a City of Ottawa Leachate Discharge Agreement for the discharge of treated leachate at the Robert O. Pickard Environmental Centre (ROPEC), the municipal wastewater treatment plant.

The leachate sampled is wastewater that has not been treated or subjected to natural attenuation. The landfill is underlain by a thick natural clay deposit which has a hydraulic conductivity, K, of less than 10^{-9} metres per second and as such performs as a natural liner. Therefore, leachate collected at the landfill is not leachate impacted groundwater, but rather it is predominantly precipitation that has infiltrated through the waste pile. It should be noted that leachate at the site could also consist of porewater from the underlying clay as a result of upward gradients and/or consolidation, noting that porewater release to the leachate collection system is slowed by the low hydraulic conductivity of the clay.

Landfill leachate is water that comes into contact with waste and leaches soluble material from the waste. Its composition is a function of the solid waste characteristics, prevailing meteorology, hydrogeology and parameters within the landfill such as pH, moisture content, degree of compaction, geometry, etc. Leachate is wastewater that dynamically alters not only with landfill age but also with changes in seasons and waste characteristics. The intrinsic biodegradability of municipal landfill leachate can be measured by a BOD:COD ratio. During the first several years of production, the BOD:COD ratio generally is in the 0.5 range. As the landfill ages, the ratio decreases to levels less than 0.1 suggesting a more or less biologically recalcitrant organic composition (Andreottola et al., 1989). Also, the concentration of ammonia tends to increase with landfill age since ammonia is a by-product of the stabilisation of organic matter (Elefiniotis et al., 1989), although at a dry waste facility such as the WCC Navan Facility, ammonia concentrations can be expected to remain relatively low.

Typical parameter concentrations in leachate are provided in the tables below. Average concentrations indicate that the WCC Navan Facility leachate is distinctly different from most other landfill sites in Ontario, including the City of Ottawa Trail Waste Facility, with most analytes measured in the WCC Navan Facility leachate having much lower concentrations. The concentration of various parameters listed below suggests a comparatively low strength leachate is generated at the WCC Navan Facility. The concentration of the traditional indicators of environmental quality (conventional pollutants) such as BOD_5, suspended solids, ammonia and metals such as iron and zinc are relatively low. The WCC Navan Facility leachate has much lower concentrations because it is not generated from municipal waste.

Parameter	WCC Navan Waste Recycling and Disposal Facility L5 *			Trail Road & Nepean Landfills [1]			Ontario Landfills [2]		
	Min.	Max.	Avg.	Min.	Max.	Avg.	Min.	Max.	Avg.

Updated by: RPM
Checked by: ETB

Water impacted by leachate will typically have high concentrations of dissolved constituents with chemical concentrations ten to several hundred times higher than those measured at reference monitoring locations. Chemical concentrations have a high temporal variability due to variations in the composition, age and moisture of the waste and meteorological conditions.

Leachate monitored in 2019 to assist with assessment of surface water and groundwater quality was sampled on June 20, August 28 and November 21, 2019. Results of the chemical analysis undertaken by Paracel and the field measured parameters are provided along with historical data in Appendix E. The results indicate that leachate generated at the WCC Navan Facility continues to be a relatively weak wastewater when compared to municipal landfill leachate.

One field blank and one laboratory trip blank were analyzed during the August 2019 monitoring session. The results of the VOCs analyses for these two samples were within acceptable tolerance limits with all parameters concentrations below the RDL.

Leachate quality monitoring results for 2019 indicate that the leachate generated at the WCC Navan Facility is not significantly different from previous monitoring events. Concentrations of ammonia, boron, chloride, potassium, and TKN show a generally increasing trend over time. The concentrations of DIC, manganese, show a general decreasing trend over time. Previously reported decreasing trend in hardness appears to be stabilizing. The concentrations of certain parameters remain above the surface water and groundwater quality near the site.

Monitoring of treated leachate is also carried out on a frequent basis in compliance with the City of Ottawa discharge requirements at the water pollution control plant (ROPEC).

6.0 GROUNDWATER COMPLIANCE ASSESSMENT

6.1 Compliance Mechanism

The objectives of groundwater trigger mechanisms at the WCC Navan Facility are to utilize the results of the ongoing groundwater monitoring program to assess site compliance and to trigger implementation of the contingency plans, when and if necessary. The purpose of the trigger mechanisms is to prevent leachate-impacted groundwater exceeding a certain negative threshold level from occurring. The trigger mechanism was outlined in the approved Hydrogeology, Hydrology and Geotechnical Study Report (Golder, 2008). The MECP has agreed that this is the preferred approach for the Navan Facility.

Traditional methods of site compliance provide very limited useful and/or reliable parameters for assessment of the WCC Navan Facility; therefore, an alternate method must be used. The difference in hydrogeology across the site coupled with the very saline environment of the clay deposit that underlies the Mer Bleue clay have resulted in the MECP accepting that Guideline B-7 (RUPO) is not applicable at this site. The MECP's position in this regard was documented in a November 2000 memorandum issued by the MECP (MOE, 2000). Therefore, the Leachate Indicator Parameter list and the method to determine if leachate from the site is impacting local groundwater was developed in the Hydrogeology, Hydrology and Geotechnical Study Report (Golder, 2008). The Leachate Indicator Parameter list includes alkalinity, ammonia, boron, chloride, hardness, magnesium, manganese and potassium.

After the completion of a monitoring session, the concentration of each Leachate Indicator Parameter for all groundwater locations used to assess compliance should be visually checked. If a parameter concentration appears to be elevated, a comparison to the background concentration range should be completed. The potential for an increase in concentration of a Leachate Indicator Parameter will be investigated by comparing the concentrations for each parameter to the background range for its corresponding stratigraphic unit. The background range will be derived from the maximum and minimum data obtained at the locations used to assess compliance from 1998 to present in each stratigraphic unit. In addition, data from monitoring well MW05-3 located to the east of the site and not impacted by landfill leachate will be used to define the background range. Groundwater Leachate Indicator Parameter trigger mechanisms and concentrations for each location used to assess compliance are presented in time-concentration graphs in Appendix F. The background ranges will be updated annually using the most recent data if it is not deemed impacted by landfill leachate. An exceedance of the background range is considered an exceedance of the trigger mechanism and the implementation of the trigger format outlined in the trigger mechanism report should proceed.

No comments from the MECP have been received on the groundwater aspects of the 2018 annual monitoring report at the time this report was completed.

6.2 Immediately Down-Gradient Wells Used to Assess Compliance

At the down-gradient limit of the landfill, groundwater quality was monitored at three nests of observation wells installed in 1992 and 1994. These wells are located at the southeast corner of the landfill (OW-92-9, OW-92-10 and OW-92-11), east of the landfill centre line at grid line 9 (OW-92-1 to OW-92-8) and at the southwest corner of the landfill (OW-94-1, OW-94-2 and OW-94-3). Two additional wells, MW-C and MW-E, were installed within the upper sand unit and shallow clay in 2000 at the northern boundary of the NCC property (now WCC property) located south of the VIA ROW. These observation wells are referred to as wells used to assess compliance.

MW07-1 is located in line with the wells used to assess compliance, to the southeast of the landfill in an area that has historically not been impacted by landfill leachate. These wells were installed in 2007 and their purpose is to monitor the future performance of the landfill expansion. With the commencement of landfilling operations in the expansion area east of the historical landfill footprint in 2016, these wells will be used along with the wells used in past reports to assess compliance along the southern property line. New trigger concentrations were proposed in the 2017 monitoring report (Golder, 2018). These trigger concentrations are implemented herein.

In 2005, three new sand layer wells used to assess compliance were installed to evaluate some unusual results at OW-94-3, OW-92-8 and OW-92-11. The new monitoring wells are called MW05-R3, MW05-8 and MW05-11 and have replaced OW-94-3, OW-92-8 and OW-92-11 for groundwater quality results, respectively, as of November 2006.

6.2.1 Sand Layer

The down-gradient compliance site groundwater quality within the sand layer was monitored during the 2019 groundwater monitoring program through the inclusion of monitors OW-94-3 and MW05-R3, OW-92-8 and MW058, OW-92-11 and MW05-11, MW-C, MW-E and MW07-1D. Monitor MW07-1D is included now that landfilling has begun in the lateral expansion area. Groundwater Leachate Indicator Parameter trigger mechanisms and concentrations for each well used to assess compliance completed in the sand layer are presented in time-concentration graphs in Appendix F-A.

Parameters exceeding the trigger concentrations are as follows:

Groundwater Monitor	Parameter(s) Exceeding Trigger Concentrations	
	June 2019 Monitoring Session	November 2019 Monitoring Session
MW-C	None	Chloride
MW-E	None	None
05-R3	None	None
05-8	Alkalinity, Boron, Manganese	Alkalinity, Boron, Hardness, Manganese, Magnesium
05-11	Alkalinity, Ammonia, Boron, Hardness	Boron
07-1D	None	None

Input: ETB
Checked: RPM

6.2.2 Weathered Clay Deposit

The down-gradient compliance site groundwater quality within the weathered clay deposit was monitored during the 2019 groundwater monitoring program through the inclusion of monitors OW-92-7, OW-92-10, OW-94-2 and MW07-1C. Monitor MW07-1C is included now that landfilling has begun in the lateral expansion area. Groundwater Leachate Indicator Parameter trigger mechanisms and concentrations for each well used to assess compliance completed in the weathered clay deposit are presented in time-concentration graphs in Appendix F-B.

Parameters exceeding the trigger concentrations are as follows:

Groundwater Monitor	Parameter(s) Exceeding Trigger Concentrations	
	June 2019Monitoring Session	November 2019 Monitoring Session
92-7	Potassium	None
92-10	Hardness, Magnesium	Hardness, Magnesium
94-2	None	None
07-1C	None	None

Input: ETB
Checked: RPM

6.3 Results

The Leachate Indicator Parameters at all groundwater monitoring locations used to assess compliance were graphed and visually checked for exceedances of the 1998 to 2018 background range.

After the reported 2018 increases in concentrations above the background ranges observed in the sand stratigraphic unit, increasing trends continued in 2019 for concentrations of two parameters: manganese at MW05-8 (with a slight decrease in concentration reported in the fall) and ammonia at MW05-11 (with a significant decrease in concentration reported in the fall). Previously reported increasing concentrations at MW05-8 and/or MW05-11 for alkalinity, ammonia, hardness (magnesium), boron and potassium had a marked decrease in 2019 (some of those concentrations decreased below their corresponding trigger concentrations either in the spring or the fall). An increasing trend in potassium concentration at monitoring well 05-3D since June 2015 continued throughout 2019, with an exceedance of the corresponding trigger concentration reported in November 2019 at this location.

Therefore, there were no continued increases throughout 2019 above the background ranges observed in the sand stratigraphic unit in 2019 at trigger locations.

It is noted that MW05-11 is located immediately down-gradient of the leachate collection system (less than 10 m south of the leachate collection system). Monitoring well MW-E, located farther down-gradient directly south of the VIA ROW, on WCC owned land, did not show any exceedances in 2019.

The maximum historical manganese concentration was reported at MW05-8 in June 2019. Manganese concentrations reported at MW05-8 in June and November 2019 (13.7 and 13.2 mg/L, respectively) are exceeding the maximum background concentration of 8.21 mg/L and are following four exceedances reported at this location since spring 2017. However, it is noted that the increasing trend in manganese concentration reported at this location since the fall of 2017 was followed in the fall of 2019 by a slight decrease, as indicated above. Manganese concentrations at this location have been variable in the past but overall there is a general increasing trend. The manganese concentrations observed in the groundwater at MW05-8 are higher than the

maximum concentration of manganese reported for leachate from L5 (8.56 mg/L). As such, it is not expected that the increasing trend of manganese concentrations is a caused entirely by landfill leachate.

The slight increases beyond their corresponding trigger concentration in the fall of 2019 for alkalinity, boron and hardness (magnesium) at MW05-8, as well as boron at MW05-11, potassium MW05-3D and chloride at MW-C will need to be assessed during the 2020 monitoring sessions to determine if their increasing trends continues.

It is proposed to increase the maximum background concentration for ammonia and chloride in the sand stratigraphic unit to 2.22 mg/L and 322 mg/L, respectively. In both cases, the elevated concentrations were reported, whereas no sign of leachate impact was observed for other parameters during the same sessions.

There were no increases above the background ranges observed in the weathered clay stratigraphic unit in 2019 at trigger locations, with the exception of concentrations for hardness and magnesium at OW-92-10 which exceeded their corresponding background concentrations in June and November 2019 (589 mg/L and 588 mg/L for hardness and 80.7 mg/L and 81.5 mg/L for magnesium, respectively). Although in both cases they stabilized in the fall 2019, the slight increase in magnesium concentration reported at 92-10 in November confirms a trigger exceedance whereas the slight decrease for hardness did not confirm the trigger exceedance. While other leachate indicator parameters at this location were reported to be well within the background range, an increasing trend since 2012 in concentrations of alkalinity and ammonia has been observed. The concentrations of alkalinity, ammonia and chloride in the groundwater from the weathered clay are lower than the concentrations observed in the groundwater from the underlying intact clay. The historic upward gradients between the intact clay and weathered clay and potential release of porewater within the intact clay may, at least in part, be the source of the increased concentrations overtime observed in the weathered clay.

The maximum chloride concentration reported at OW-94-2 in November 2017 does not appear to be related to leachate impacts but rather natural (or influence from a secondary source) variations. Therefore, as proposed in the 2018 Annual Monitoring Report (Golder, 2019), the background maximum chloride concentration in weathered clay was increased from 605 to 629 mg/L.

Groundwater quality in the intact clay and glacial till/upper bedrock unit was not monitored during the 2019 monitoring session. Monitoring of these stratigraphic units occurs every 18 months with the next scheduled session in spring 2020. Concentrations of Leachate Indicator Parameters in groundwater samples collected in 2018 from compliance monitors screened in the intact clay unit were all below the respective trigger concentrations, except for concentrations of potassium, magnesium and hardness at MW07-1B, reported in November 2018, which exceeded their corresponding maximum background concentration. These exceedances will need to be verified during in the spring 2020 monitoring session. If future results do not reflect an upward trend and the data appears to be reasonably accurate, a recommendation to increase the trigger concentration could be made if groundwater quality in this monitoring well is still considered unimpacted by landfill leachate.

Concentrations of Leachate Indicator Parameters in groundwater samples collected from compliance monitors screened in the glacial till/upper bedrock unit in 2018 were all below the respective trigger concentrations, except for the concentration of magnesium from glacial till monitoring well MW07-1A reported in November 2018 (12.9 mg/L) which was above the trigger concentration. This exceedance would have to be confirmed during the spring of 2020. It follows another exceedance reported in the spring of 2017 with a possible short duration increasing trend associated with magnesium concentrations at this location. If future results do not reflect an upward trend and the

data appears to be reasonably accurate, a recommendation to increase the trigger concentration could be made if groundwater quality in this monitoring well is still considered unimpacted by landfill leachate.

Exceedances were also reported in November 2018 for alkalinity at MW05-3A and MW07-1A and hardness at MW07-1A. These exceedances will need to be confirmed during the spring 2020 monitoring session.

6.3.1 Confirmed Exceedances and Proposed Course of Action

As mentioned above, one confirmed exceedance of the trigger concentration was reported in the sand stratigraphic unit in June 2019 for manganese concentrations at MW05-8. However, the concentration reported in November 2019 at this location was lower and therefore did not confirm the continued increase in concentration. In the weathered clay stratigraphic unit, only one confirmed exceedance was reported in 2019 for magnesium at MW92-10.

Following the confirmed exceedances reported in the 2018 annual monitoring report (Golder, 2019), in accordance with ECA Condition 123 (a), WCC informed the MECP Ottawa District Office of these exceedances in a phone call on March 6, 2019. Trigger results of the spring and fall monitoring sessions were reported by Golder, on behalf of WCC, to the MECP Ottawa District Office via email on August 8, 2019 and December 24, 2019, respectively. In accordance with the proposed course of action presented to the MECP in the 2018 annual monitoring report and communications in 2019, WCC acquired a spare leachate pump to reduce down time when a pump requires servicing and WCC intends to proactively maintain the forcemain in good working condition in a continuing effort to achieve a drained state in the leachate collection system.

Leachate pumping and disposal operating issues reported in the fall 2018 had an impact to groundwater quality in the sand and weathered clay units in monitoring wells located immediately downgradient of the leachate collection system (less than 10 m south of the leachate collection system and close to the south toe collector). Concentrations of some Leachate Indicator Parameters in the sand unit spiked in November 2018, but the efforts from WCC in 2019 were successful in limiting the continued increases in concentrations. Concentrations are expected to stabilize or decrease in future monitoring sessions as long as these corrective actions continue to be implemented. Since the hydraulic conductivity of the sand is greater than the weathered clay, it is expected that elevated concentrations will take longer to dissipate in the weathered clay unit. Increasing trends in the weathered clay will be monitored closely in 2020.

Results from the upcoming spring 2020 monitoring session will be analyzed to determine if the effect of these actions are detected in groundwater quality with a decrease in concentrations of Leachate Indicator Parameters at trigger locations. At that point, the need for a formal contingency plan will be assessed in collaboration with the MECP. It is WCC's intention to continue implementing in 2020 the proposed voluntary action plan to address increases in concentrations.

7.0 SURFACE WATER QUALITY ASSESSMENT

7.1 Quality Control/Quality Assurance

One blind sample duplicate was analyzed per surface water monitoring session in 2019 as part of the QA/QC protocol. In addition, the laboratory performs equipment blanks as an internal method of QA/QC.

Analytical results on blind sample duplicates are deemed to be outside of acceptable tolerance limits if the RPD between the original sample and its duplicate is greater than 50% when both analytical results are between 10 and 20 times the RDL or if the RPD is greater than 30% when both analytical results are greater than 20 times the RDL.

All duplicate results for surface water were within acceptable tolerance limits in 2019, with the exception of concentrations reported for manganese at one surface water monitoring station in August 2019 (135 mg/L for the primary sample and 355 mg/L for the duplicate sample, respectively). The concentration in the duplicate sample is uncharacteristic of manganese concentrations at this location. Since the concentration reported in the primary sample is within the range of historical concentrations reported at this location, the 2019 surface water data reported by the laboratory for manganese is considered anomalous but overall the surface water is considered acceptable.

7.2 Surface Water Quality Monitoring

A total of eleven surface water stations continue to be monitored on an on-going basis at this site. The monitoring stations have been located to obtain representative information on water quality up-gradient from the landfill at stations S1, S3, S15, S16 and S17 (background), on water quality at compliance sites down-gradient from the landfill at stations S5, S8 and S9 and on water quality in the Mer Bleue Bog at S10 (SW-W), S11 (SW-C) and S12 (SW-E). Monitoring locations SW-W, SW-C and SW-E are location references used by the NCC.

Stations S1 and S17 are located northeast and up-gradient from the landfill and are considered not to be impacted by the landfill operations. Stations S3, S15 and S16 are located to the west/northwest and up-gradient from the landfill and are considered not to be impacted by the landfill operations. Station S1 is located at the northeast corner of the landfill below a culvert that discharges into a south flowing east perimeter ditch. Station S3 is located at the northwest corner within the site buffer, down-gradient from where a north diversion ditch flows into a west drainage channel. Station S15 is located to the west of the landfill where the north ditch flows into a southward flowing west perimeter ditch. Station S16 is located northwest of the site in a ditch along the south side of Navan Road and up-gradient from station S15. Station S17 is located in an east ditch along the south side of Navan Road and up-gradient from station S1. These stations are considered to be representative of up-gradient background surface water quality.

Stations S5, S8 and S9 are located down-gradient from the landfill. Station S5 is located at a culvert beneath the VIA Rail right-of-way (ROW) just east of the landfill centre line near grid line 10 and is dry throughout most of the year. Station S8 is located in a wide and shallow westward flowing channel having a swamp environment and is down-gradient from the southwest corner of the landfill and north of the VIA ROW, immediately west from where the west drainage channel discharges into the ditch. Station S9 is located near a large concrete box culvert beneath the VIA ROW and down-gradient from the southeast corner of the landfill. Since the fall of 2013, water has been backing up upstream of surface water station S9 as a result of blockage in the box culvert by aggressive beaver activity. Steps were taken by WCC in spring 2017 to reduce the beaver activity in the area and no blockage was observed during the fall monitoring session. No specific beaver activity was noted in 2019.

Surface water sampling stations S10, S11 and S12, also referred to by the NCC in other reports as SW-W, SW-C and SW-E, respectively, are located south of the landfill at the northern edge of the Mer Bleue Bog and consist of stagnant bog water. Stations S10, S11 and S12 were added in 1995 to obtain data considered to be representative of water quality in the receiving water at the perimeter of the bog.

For the purpose of surface water quality assessment, the background surface water quality is assumed to be represented by the data available from stations located in close proximity to the landfill and up-gradient of surface water flow. For the 2019 monitoring program, the PWQO is being applied for the purpose of water quality assessment at the surface water sampling stations.

Surface water monitoring for 2019 was carried out on June 20, August 28, and November 21 at up-gradient control sites S1, S3, S15, S16 and S17, sites S5, S8 and S9 and the down-gradient control sites S10, S11 and S12. Analytical test reports submitted by Paracel for water samples obtained in 2019 are provided in Appendix B. Historical data are also provided in Appendix G.

Station S5, S8, S9, S10, and S11 were found to be dry during the summer monitoring session in 2019. Therefore, samples could not be collected at these stations at the time.

Water quality data was compared to historical data obtained at each station and trends in the concentration of key indicator parameters were examined.

The PWQO criteria for chromium changed in 1999 from chromium to chromium III and chromium VI. The laboratory reports total chromium and the exceedances noted in the tables in the following sections are values of total chromium that are greater than the PWQO for chromium III, i.e. 8.9 µg/L (there is no PWQO for total chromium). Should current data show an increasing trend, attempts will be made to separate the analysis into chromium III and chromium VI.

7.2.1 Up-Gradient Control Stations

The up-gradient surface water quality was monitored during the 2019 monitoring program through the inclusion of up-gradient stations S1, S3, S15, S16 and S17.

The surface water quality during 2019 met the PWQO for all parameters analyzed with the exception of the following:

Surface Water Station	Parameter(s) Exceeding or Outside PWQO		
	June 2019 Monitoring Session	August 2019 Monitoring Session	November 2019 Monitoring Session
S1	[None]	Cobalt, copper, iron, phenols, and total phosphorous	[None]
S3	Dissolved oxygen and iron	Dissolved oxygen, iron, phenols, and total phosphorous	Dissolved oxygen and iron
S15	Iron and total phosphorus	Iron, phenols, and total phosphorous	Cobalt, iron and phenols
S16	Cobalt, copper, dissolved oxygen, iron and total phosphorous	Cobalt, dissolved oxygen, iron, phenols, and total phosphorous	Chromium, cobalt, copper, dissolved oxygen, iron, lead, phenols, total phosphorous, and zinc
S17	Iron and total phosphorous	Cobalt, copper, dissolved oxygen, iron, phenols and total phosphorous	Iron, phenols and total phosphorous

Input: ETB
Checked: RPM

000063

As apparent from the above table, the up-gradient surface water quality is characterized by concentrations of the following parameters which exceed or are outside the PWQO: chromium, cobalt, copper, dissolved oxygen, iron, lead, phenols, total phosphorus and zinc. Occasional PWQO exceedances of cadmium and boron have been observed in the past as well.

Surface water quality is generally consistent over time (with seasonal variability). An increasing trend in concentrations of alkalinity can be observed at surface water station S1 over time. Previously observed overall increasing trends for concentrations of chloride, DIC, sodium, TDS, hardness and conductivity at surface water station S1, concentrations of alkalinity, ammonia, DIC and iron at surface water station S3 (previously reported elevated concentrations were reported at this station in August 2018, have returned to typical historical concentrations), and concentrations of manganese, sodium and TDS at surface water station S15 appear to have stabilized, with seasonal variability remaining. Similarly, the previously observed decreasing trend in dissolved oxygen concentrations at surface water stations S3 appears to have stabilized with seasonal variability remaining. A slight increasing trend in iron concentrations is observed at surface water station S15.

The current or historical increases in concentrations of parameters at these locations is not related to leachate impact as these stations are up-gradient of the site.

7.2.2 Down-Gradient Control Stations

The down-gradient surface water quality was monitored during the 2019 monitoring program through the inclusion of down-gradient stations S10, S11 and S12.

The surface water quality during 2019 met the PWQO for all parameters analyzed with the exception of the following:

Surface Water Monitor	Parameter(s) Exceeding or Outside PWQO		
	June 2019 Monitoring Session	August 2019 Monitoring Session	November 2019 Monitoring Session
S10	Cobalt, dissolved oxygen, iron and total phosphorous	[No sample collected due to dry conditions]	Boron, cobalt, dissolved oxygen, iron, phenols, and total phosphorus
S11	Dissolved oxygen, iron and total phosphorus	[No sample collected due to dry conditions]	Boron, chromium cobalt, copper, dissolved oxygen, iron, phenols, total phosphorus, and zinc
S12	Cobalt, copper, dissolved oxygen, iron, lead, total phosphorus, and zinc	Chromium, cobalt, iron, lead, phenols, and total phosphorous	Iron, phenols and total phosphorus

Input: ETB
Checked: RPM

As apparent from the above table, the down-gradient surface water quality is characterized by dissolved oxygen, iron, and total phosphorus concentrations which exceed or are outside the PWQO. Occasional PWQO exceedances of boron, cadmium, cobalt, copper, chromium, phenols and zinc have been observed.

The concentrations of most of the parameters that exceeded the PWQO in the down-gradient control stations S10 and S11 during the June, August and November 2019 monitoring sessions were generally similar to or lower than the surface water quality at the up-gradient station S16 during the same session.

Surface water quality at the control down-gradient stations is generally consistent over the years with no specific trends observed.

7.3 Surface Water Compliance Assessment

As previously mentioned, surface water data at the WCC Navan Facility is variable over time and the Mer Bleue Bog surface water quality is poor. It becomes increasingly difficult to assess surface water site compliance with scattered data. The WCC Navan Facility is an engineered landfill site. Therefore, an excursion of leachate would be apparent in the underlying stratigraphic units prior to a surface water impact. As such, a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. A site-specific groundwater based trigger mechanism is the appropriate approach for the WCC Navan Facility. Surface water quality monitoring will continue at the site, with the samples analyzed for appropriate parameters of concern and evaluated for potential impacts. This approach was outlined in the approved Hydrogeology, Hydrology and Geotechnical Study Report (Golder, 2008). The MECP has agreed that this is the preferred approach for the WCC Navan Facility.

8.0 SEDIMENTS

Sediment samples SED-W, SED-C and SED-E were obtained at the surface water sampling stations SW-10, SW-11 and SW-12, respectively, on June 20, August 28 and November 21, 2019. Laboratory reports are presented in Appendix B and the results are summarized in Table 4 and Table 5. Included for comparison in Table 4 and Table 5 are the MECP Table 1 sediment criteria and Table 2 and Table 4 Recreation/Parkland soil criteria (MOE, 2011) and the CCME freshwater sediment and Recreation/Parkland soil criteria (CCME, 1999). The table below summarizes the parameters which exceeded sediment criteria.

Sediment Monitor	Parameter(s) Exceeding MECP Table 1 Sediment		Parameter(s) Exceeding CCME Freshwater Sediment	
	June 2019 Monitoring Session	November 2019 Monitoring Session	June 2019 Monitoring Session	November 2019 Monitoring Session
SED-E	Copper, nickel	[None]	[None]	[None]
SED-C	[None]	[None]	[None]	[None]
SED-W	[None]	Copper	[None]	[None]

Input: ETB
Checked: RPM

Analytical results on the sediment samples indicate that no parameters exceed the CCME Guidelines for freshwater sediment. Copper and nickel concentrations exceed the MECP Table 1 sediment criteria. The analytical results observed at the sampling locations are consistent with historical results observed at the respective locations.

The following table summarizes the parameters which exceeded the soil criteria in 2019.

Sediment Monitor	Parameter(s) Exceeding MECP Table 2/Table 4 Soil		Parameter(s) Exceeding CCME Soil	
	June 2019 Monitoring Session	November 2019 Monitoring Session	June 2019 Monitoring Session	November 2019 Monitoring Session
SED-E	Boron	Boron	[None]	[None]
SED-C	Boron	Boron	[None]	Selenium
SED-W	Boron	Boron	[None]	Selenium

Input: ETB
Checked: RPM

Analytical results on the sediment samples indicate that boron exceeds MECP Table 2 and Table 4 soil criteria during the spring and fall monitoring sessions at each sampling location. Selenium exceeded the CCME soil criteria during the fall monitoring session at SED-C and SED-W. In general, parameter concentrations measured in the sediment were similar to previously reported concentrations.

Natural wetland systems have been used to treat a variety of wastewater including agricultural and surface mine runoff, irrigation return flows, leachate, urban storm water discharge and other sources of water pollution (U.S. Environmental Protection Agency, 1987). Today, increasing attention is being given to artificial wetlands for the treatment of wastewater. Approximately 90% of Canada's 127 million hectares of wetlands are classified as peatlands where peaty soils are predominant (NAWCC, 1994). The value of peat as an agent for pollution prevention and control has been recognized during the last three decades. Peat's value is directly related to its unique physical and chemical properties. Compared to other mineral soils, peat has a very high organic content (60% carbon), with lignin and cellulose as its main constituents. Peat has a large specific area and is highly porous, properties similar to natural zeolites and activated carbon, which makes it a good adsorbent material (McLellan and Rock, 1988). These contain some functional organic groups such as carboxyl and amino groups that form complexes with metal ions (Dissanayake and Weerasooriya, 1981). Peat is also reported to exhibit ion exchange capacities (Sharma and Froster, 1993). The combination of the above mentioned properties, i.e., being a good adsorbent, forming complexes with metals and having ion exchange capacity makes peat an excellent metal trapping media. Peat is proven to be effective in removal of lead, cadmium, zinc and chromium from raw wastewater (Zhipie et al., 1984), removal of hexavalent chromium from wastewater, removal of copper, iron, manganese, zinc, lead and potassium from industrial wastewater (Cameron, 1978). Sphagnum peat, such as the peat found in eastern Ontario, is reported to be the most suitable peat to use for wastewater treatment systems, in terms of decay resistance (Warith, 1996).

The peat deposit in the Mer Bleue Bog predates any human activity in this area. Having filtered hundreds of years of surface runoff water into the perimeter portion of the bog, it should not be surprising to find contaminants in this natural sink. Water levels in the Mer Bleue Bog fluctuate naturally from time to time and have been aggressively drained (in the early 1930's) to promote agricultural exploitation of the bog. Drainage of the Mer Bleue Bog is now under the management of the NCC. In more recent years, water levels have been allowed to rise and agricultural use of the bog has been significantly reduced. From time to time, given the right water levels and environment, the release of constituents absorbed by the peat can be expected. Therefore, it would appear that metals in excess of sediment criteria are the result of natural peat processes and not impacts from the landfill.

In 2002/2003, an assessment of the WCC site operations was undertaken in support of a WCC-NCC exchange of land parcels located south of the Navan landfill along the northern margin of the Mer Bleue. The assessment concluded that the landfill site had not caused impacts to soil, sediment, groundwater or surface water quality within the Mer Bleue. These findings were accepted by the NCC.

9.0 PROPOSED 2020 MONITORING PROGRAM

The proposed 2020 Environmental Monitoring Program is the same as was conducted in 2019, with the exception of VOCs which are proposed to be removed from the list of parameters of the groundwater monitoring program and sediment monitoring which is proposed to be discontinued.

In groundwater samples, VOCs were detected at times in groundwater monitoring wells located immediately downstream of the waste footprint, with most occurrences of VOC detections happening in 2007 and 2008 in wells MW05-11 and MW05-8 when spikes were also experienced in other leachate indicator parameter concentrations. Even then, the VOC concentrations were well below the ODWQS with no recorded exceedance of ODWQS in downgradient wells with the exception of benzene concentrations at MW05-11 more than 10 years ago (in November 2007, May 2008 and November 2008) and MW05-8 (November 2008, December 2008 and May 2009). Some VOCs (relatively low concentrations or one or more of benzene, toluene or ethylbenzene) are sometimes detected in leachate samples (location L5) with some exceedances slightly above the ODWQS. It is proposed to continue monitoring VOCs in leachate and monitoring for VOCs in downgradient monitoring wells could be resumed if an increase in VOCs in leachate is observed.

As explained in Section 7.3, the MECP agreed that an excursion of landfill leachate would be apparent in the underlying stratigraphic units prior to a surface water impact and a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. Therefore, it is proposed to discontinue sediment monitoring and rely on the groundwater and surface water monitoring programs to assess off-site leachate impacts. With MECP concurrence, sediment monitoring could resume temporarily if leachate impacts and trigger exceedances are reported at the site.

As per Condition 109 of the ECA No. A460702, the monitoring wells located in borehole 09-1 will be sampled once per year to assess the groundwater quality in the Mer Bleue. However, due to the on-going inability to collect water samples because of the frozen conditions necessary to access the wells in the winter, efforts will be made to collect a sample during a dry period (i.e., in the summer) as it was done since 2014.

Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected during November 2018 monitoring session and will be monitored again in the spring of 2020.

The objectives of the 2020 environmental monitoring program are:

- to comply with the annual monitoring and reporting requirements stipulated in Conditions 109, 112, 135 and 136 of ECA No. A460702
- to assess any potential impacts on water quality at the site resulting from landfill operations
- to continue the monitoring of water quality for key parameters at target locations up-gradient and down-gradient from the landfill
- to document the chemical composition of groundwater and surface water in the vicinity of the landfill
- to assess site compliance with site specific trigger levels relating to groundwater impacts due to leachate
- to document the chemical composition of sediment in the Mer Bleue Bog

10.0 LIMITATIONS AND USE OF REPORT

This report was prepared for the exclusive use of Waste Connections of Canada. The report, which specifically includes all tables and figures, is based on data and information collected by Golder and is based solely on the conditions of the properties at the time of the work, supplemented by historical information and data obtained by Golder as described in this report.

Golder has relied in good faith on all information provided and does not accept responsibility for any deficiency, misstatements, or inaccuracies contained in the report as a result of omissions, misinterpretation, or fraudulent acts of the persons contacted or errors or omissions in the reviewed documentation.

The assessment of environmental conditions and possible hazards at this site has been made using the results of physical measurements from a number of locations. The site conditions between sampling locations have been inferred based on conditions observed. Groundwater, leachate and/or surface water quality conditions may vary from these sampled locations.

The services performed, as described in this report, were conducted in a manner consistent with that level of care and skill normally exercised by other members of the engineering and science professions currently practicing under similar conditions, subject to the time limits and financial and physical constraints applicable to the services.

Any use which a third party makes of this report, or any reliance on, or decisions to be made based on it, are the responsibilities of such third parties. Golder accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

11.0 CLOSURE

We trust this report meets your current needs. If you have any questions regarding this report, please contact the undersigned.

Notes:

^ top of riser and surface elevation obtained in Nov. 2005. New survey done in Nov. 2011 for top of riser.

The top of riser elevation at MW09-1A was adjusted for the November 2015 groundwater elevation calculations based on new measurement of stick-up obtained in November 2015 compared to the ground surface elevation surveyed in 2003.

Prepared by: ETB
Checked by: YJM

Notes:

* top of riser and surface elevation obtained in Nov. 2005. New survey done in Nov. 2011 for top of riser.

The top of riser elevation at MW09-1A was adjusted for the November 2015 groundwater elevation calculations based on new measurement of stick-up obtained in November 2015 compared to the ground surface elevation surveyed in 2003.

Notes:

* top of riser and surface elevation obtained in Nov. 2005. New survey done in Nov. 2011 for top of riser.
The top of riser elevation at MW09-1A was adjusted for the November 2015 groundwater elevation calculations based on new measurement of stick-up obtained in November 2015 compared to the ground surface elevation surveyed in 2003.

1.0 INTRODUCTION

On September 12, 2019 Senior Environmental Officer A. Cappello of the Ministry of the Environment, Conservation and Parks (Ministry), Ottawa District Office conducted an inspection of Waste Connections Canada (WCC), formerly Progressive Waste Solutions Canada Inc. Navan Waste Recycling and Disposal Facility located at 3354 Navan Road in Ottawa, Ontario (the Site). The purpose of this inspection was to assess WCC's compliance with the requirements of the Environmental Protection Act, R.S.O. 1990, c. E. 19, as amended (EPA), Ontario Regulation 347 (O.Reg 347) and Provisional Certificate of Approval Waste Disposal Site Approval A460702.

Prior to conducting the inspection, available data and information, including the ECA and notices, previous inspection reports and the 2018 Operations and Monitoring Report report were reviewed. The 92.85 hectare waste management facility that includes a 40 hectare landfill and processing operations is located on the west side of Navan Road, south of Renaud Road. The adjacent properties include residential homes, the Mer Bleue Bog and commercial properties. The Site is secured with fencing, marsh areas, berms, ditches and a locked gate. WCC employs approximately 26 people and operates Monday to Saturday from 7:00 until 6:00 p.m. with Site preparations occasionally taking place on the weekend. The inspection included an interview and Site tour which were provided by Mr. Henri Huneault, Site Manager.

The Site is permitted to receive waste generated within the Province of Ontario while the processing site may accept waste generated within Outaouais and the Province of Ontario. No waste from the City of Toronto shall be accepted for disposal or for processing at the Site. The Site is permitted to accept only solid non-hazardous municipal waste, asbestos waste, commercial and institutional (IC&C) waste including construction and demolition waste, dry non-putrescible domestic waste and impacted soil. Similarly at the processing site only solid non-hazardous municipal waste excluding putrescible waste shall be accepted.

In June 2015 WCC received approval to operate a Soil Treatment Pad at the landfill and processing facility. Notice 8 under ECA A460702 provides the governing operational requirements for the soil remediation pad, including, training

of personnel, sampling and analysis, uses of soil post soil remediation.

Active landfilling was undertaken in the Phase 1 of the landfill between January and October of 2018 followed by Phase 4 area in October through to the end of December 2018. Other activities undertaken at the Site include the excavation of the east cell identified as Phase 6, continued recycling operations at the facility with treatment of hydrocarbon impacted oils, screening of oversized materials and the pre-treatment and disposal of collected leachate to ROPEC for off-site treatment.

2.0 INSPECTION OBSERVATIONS

Certificate of Approval Number(s):
Provisional Certificate of Approval No. A460702, dated April 16, 2009, was issued to Waste Services (CA) Inc., now WCC. The approval officially revoked and replaced the previous approval that was dated May 12, 2006 due to the Site's expansion. The following summarizes the notices that have amended ECA No. 460702:

Notice No. 1 dated October 9, 2009: Permitted construction of base liner and leachate collection system for Phase 1
Notice No. 2 dated August 4, 2010: Widening of Navan Road
Notice No. 3 dated November 1, 2010: Landfill gas odour control system
Notice No. 4 dated April 29, 2011: Financial assurance update (processing Site)
Notice No. 5 June 13, 2012, Notice No. 5: Financial assurance update (processing Site)
Notice No. 6 dated: Financial assurance update (processing Site)
Notice No. 7 dated February 25, 2014: Financial assurance update (landfill)
Notice No 8 dated June 8, 2015: Soil Treatment Pad
Notice No. 9 dated February 1, 2016: Financial assurance update (landfill)
Notice No. 10 dated March 14, 2017: Financial assurance update (combine landfill and processing site FA)

Amended Environmental Compliance Approval (Air) No. 3536-8APNZD was issued to on November 24, 2010 for the approval of one flare, one candlestick flare, one lot of natural gas heating, ventilation and air conditioning equipment and one leachate pumping facility. The conditions of the Air ECA were not included in this inspection.

2.1 FINANCIAL ASSURANCE:

Specifics:
Condition 15 (a) through (e) updated in Notice No. 10 dated March 14, 2017 outlines the financial assurance (FA) requirement for the landfilling and processing operations. The most recent notice combined the FA requirements for the landfill and processing site.

WCC is required to provide FA in a form acceptable to the Director in the amount of $13,914,411 (cumulative payment) no later than January 31, 2018. Condition 15 (d) states that the financial assurance will be reviewed every three years starting on January 18, 2018. WCC is currently in compliance with their financial assurance requirements.

2.2 APPROVED AREA OF THE SITE:

Specifics:
The Site is approved for the use and operation of a 40 hectare footprint within a total waste disposal site of 92.85 hectares. Litter fences to control windblown litter were observed at the top of the landfill mound on the active face.

2.3 APPROVED CAPACITY:

Specifics:
The capacity of the Site is 7,600,000 cubic meters. The Site is permitted to receive up to a maximum daily rate averaged over a year, including daily and interim cover, of 1,500 tonnes per day. The maximum annual amount at which the Site can receive waste for disposal is 234,750 tonnes. The 2018 Operations and Monitoring Report (2018 AMR) stated a total of 408,041 tonnes of materials entered the Site. Of this total, 233,994 tonnes (57.35%) were received as landfill materials, 14,712 tonnes (3.61%) were recycled and removed from the Site and an estimated 50.7 tonnes (0.01%) were waste materials rejected and removed from the Site by WCC for alternative disposal at another licensed facility. Other materials received for re-use on Site included 11,935 tonnes (2.92%) of rock, brick, concrete and rubble re-used as aggregate for road construction, 5,623 tonnes (1.38%) of clean fill, topsoil, and asphalt re-used on Site for final grading, road/pad construction and engineered fill, 31,726 tonnes (7.78%) of treated soils re-used for final cover and structural fill in the east buffer area; and 110,000 tonnes (26.96%) of special materials such as storm sewer screenings and impacted non-hazardous soils that were received at the Site for re-use as cover material.

The life expectancy remaining for the Site as of January 1, 2019 is estimated to be approximately 7.71 years to 11.4 years although the actual life of the landfill will vary based on annual fill rates, in-place waste density, waste diversion and recycling initiatives.

2.4 ACCESS CONTROL:

Specifics:
The Site was inspected on September 12, 2019 at a time when facility was open to the public. During the Site inspection, the scale house with both an incoming and outgoing scale was observed. Mr. Huneault confirmed the scale house attendants are trained to assess incoming loads of waste to ensure only solid non-hazardous waste that is not putrescible is contained in the vehicles. The scale house attendant also confirms compliance with Condition 34 which states only waste from the Province of Ontario, is accepted at the Site. In addition, the scale house attendant confirms compliance with Condition 35 which states only waste generated within the Outaouais and Province of Ontario, may be received at the Processing Site. Waste from the City of Toronto shall not be accepted at the landfill or at the processing site. WCC also employs a screener who is positioned near the active face and uses a CB to communicate with other employees. It is the screener's responsible to identify truck containing unacceptable waste and to scare away the birds.

On occasion, unwanted or inappropriate wastes may be found at the landfill Site such as putrescible wastes or liquid industrial wastes. WCC has a standard operating procedure to identify and remove the waste appropriate for disposal at another licensed facility. WCC completes a Rejected Waste Form and submits the notification to the Ottawa District Office as required in Condition 133. In 2018 the ODO received fifteen Rejected Waste Form notifications via email.

2.5 COVER MATERIAL:

Specifics:
Cover material requirements are outlined in Conditions 55, 56 (a) though (c) and 57 through 60. Acceptable materials used for daily cover include clean aggregate, foundry sand, wood chips and contaminated soil. Condition 56(a) requires daily cover in the amount of 150 mm be applied at the end of each working day. Since the Site was operational during the Site inspection this daily cover had not yet been applied. The active face was confined to one area and the use of screen fencing was being utilized to control litter. Contaminated soil deposited at the Site is a big component of the daily cover used. Hydrocarbon impacted soils are brought to the pad for processing. One WCC employee is responsible for assessing compliance with Condition 139.1 and associated analytical results confirming the soil is solid non-hazardous waste.

A Special Waste Profile is completed for any foundry sands, contaminated soils and asbestos waste.

Condition 56(b) requires intermediate cover in the amount of 300 mm be applied in areas where landfilling has been temporarily discontinued for six months or more. Intermediate areas were well covered and no windblown litter present. Numerous trees have been planted to add to the existing screening at the Site to restrict the view of the recycling storage area.

Condition 56(c) requires final cover in the amount of 900 mm of clay and 150 mm of top soil shall be applied on waste areas that have reached final contours. Outer bermed areas of the Site have received grading and tree planting activities to promote a visually appealing look of the Site.

Condition 57 requires existing intermediate cover material that has eroded such that waste is exposed, the cover material shall be promptly replaced. It was reported that erosion issues are part of the weekly inspections at the Site that generally erosion has not been an issue.

2.6 WASTE BURNING:

Specifics:
Condition 54 prohibits the burning of waste, including wood waste and brush at the Site. No evidence of burning was observed during the Site inspection.

2.7 GROUNDWATER/SURFACEWATER IMPACT:

Specifics:
The monitoring at the Site consists of water quality analysis of surface water, groundwater and leachate. The monitoring program is outlined in Conditions 109 and 112 of ECA A460702. Condition 109 requires WCC to carry out groundwater and surface water monitoring and Condition 112 requires a Professional Geoscientist or Engineer

possessing the appropriate hydrogeological training and experience to execute or directly supervise the execution of the groundwater monitoring and reporting program. Currently Golder Associates Ltd (GAL) completes the sampling programs which meets the requirements of Condition 112. Results of the monitoring program are detailed in the 2018 Operations and Monitoring Report (herein after referred to as the 2018 Annual Monitoring Report/AMR).

The 2018 AMR states the following: "Groundwater at the Navan Facility is monitored within four stratigraphic units identified as a shallow surface sand layer, an upper weather clay zone, an intact (unweathered) deposit of clay and a glacial till/upper bedrock zone. Monitoring wells are present up-gradient, at the down-gradient edge (used to asses compliance) and further down-gradient of the landfill in each of these units". Water quality monitoring programs are carried out twice annually for groundwater and three times annually for surface water and leachate. Surface water quality monitoring was completed on May 23rd, August 30th and November 28th of 2018. Leachate was sampled at the pump station on May 23rd, August 30th and December 19th. Groundwater quality monitoring was completed on May 15th, August 30th and November 22, 2018. Groundwater monitoring wells further in the Mer Bleue Bog were sampled on August 30th, 2018.

The Ministry has stated that the Reasonable Use Guideline is not applicable at this Site. A compliance assessment of groundwater quality was completed using the accepted groundwater and surface water trigger mechanisms (Golder, 2007b). The Leachate Indicator Parameters at all groundwater monitoring locations immediately downgradient from the landfill, which are used to assess compliance, were graphed and visually checked for exceedances of the 1998 to 2017 background range.

The following comments were made in the AMR:

In 2018, one confirmed exceedance of trigger concentration was reported in November for manganese concentrations reported at MW05-8 (with three successive exceedances with an increasing trend) and one confirmed exceedance of the trigger concentration was reported in November for boron at MW05-11 (three successive exceedances with a spike or short duration increase trend). WCC notified the ODO (the undersigned provincial officer) by telephone on March 6, 2019.

The AMR also states that although the manganese concentrations reported at MW05-8 are not believed to be caused by landfill leachate, the boron exceedances combined with increasing trends in concentrations for other Leachate Indicator Parameters indicated that the operating issues experienced in the fall with leachate pumping and disposal activities having to be stopped for long periods of time have had an impact to groundwater collection system (less than 10 metres south of the leachate collection system and close to the south toe collector). High groundwater table elevations reported at downgradient locations in the spring of 2017 and 2018 may have also contributed to the exceedances reported prior to November 2018. The results from the 2019 sampling program will be analysed to determine the need for a formal contingency plan.

In addition, the groundwater and surface water trigger mechanism report prepared by GAL demonstrates a clear difference between up-gradient (north) and south property boundary water quality on the east side of the property, where there are no potential impacts from landfill activities. Naturally elevated parameters measured include boron, copper, iron, arsenic, lead, sodium, alkalinity, bicarbonate, TDS, COD and chloride.

The approved groundwater monitoring program was followed, except that as discussed in Section 1.0, groundwater monitoring locations BH09-1A, BH09-1B, BH09-1C and BH09-1D were not sampled during the winter of 2017 due to historical conditions of frozen water in the monitoring wells; these wells were sampled instead during the summer session on August 28, 2017 for BH09-1D and fall sessions on November 29, 2017 for BH09-1B and BH09-1C (frozen conditions were observed at BH09-1A during the fall session).

The 2019 AMR will be reviewed by the Ministry's hydrogeologist upon receipt in the new year.

Surface Water

Surface water and leachate sampling was completed on May 23, August 30, and November 28, 2018. The only deviations from the approved surface water monitoring program were that due to dry or stagnant conditions, surface water monitoring station S5, S8, S9, S12 and S20 were not sampled in August monitoring session.

A total of eleven surface water stations are monitored to obtain representative information on water quality up-gradient from the landfill and to assess compliance at down-gradient stations. Analytical results for up-gradient surface water stations show the surface water quality of characterized by concentrations of the following parametres which exceed or are outside the PWQO: cadmium, chromium, cobalt, dissolved oxygen, iron, lead, phenols, total phosphorus and zinc. Surface water quality is generally consistent over time with seasonal variability. GAL concluded that increases in concentrations of parameters at these locations is not related to leachate impact as these stations are up-gradient of

the site.

Analytical results for the down-gradient surface water stations are summarized in the table under section 7.2.2. Landfill Monitoring Report. Exceedances of the PWQO are various parameters, including the following; dissolved oxygen, iron, total phosphorus, boron, cobalt, phenols, cadmium and lead. These exceedances were observed in monitoring stations S10, S11 and S12. GAL's report states that the concentrations of most of the parameters that exceeded the PWQO in the down-gradient control stations S10 and S11 during the August and November 2018 monitoring sessions were generally similar or lower than the surface water quality at the up-gradient station S16 during the same session. Surface water quality at the control down-gradient stations is generally consistent over the years with no specific trends observed.

Leachate

The leachate monitoring program following the program outlined in Conditions 109 and 112 of the ECA A460702. Leachate quality analysis was undertaken on samples obtained from the pump station (L5) during the May 23rd, August 30th and December 19th monitoring sessions. Due to the leachate pump being out-of-service during the November sessions, no sample could be collected at the time, therefore a sample was collected in December.

The leachate sampled is wastewater that has not been treated or subjected to natural attenuation because the landfill is underlain by a thick natural clay deposit that performs as a natural liner. Therefore, leachate collected at the landfill is not leachate impacted groundwater but is predominantly precipitation that has infiltrated through the waste pile.

As reported in the 2018 AMR, average concentrations indicated that landfill leachate is distinctly different from most other landfill sites in Ontario as most analytes measured have a much lower concentrations. Leachate quality monitoring results for 2018 indicates that leachate generated at the Site is not significantly different from previous monitoring events. The results indicated that leachate generated at the Site continues to be a relatively weak wastewater when compared to municipal landfill leachate.

2.8 LEACHATE CONTROL SYSTEM:

Specifics:
Condition 86 of the ECA requires that the leachate management system be managed and operated as described in Item 41 in Schedule A attached to the ECA. Item 41 is the Design and Operations Manual approved for the landfill in January 2008. An elaborate perimeter leachate collection system (LCS) and surface water diversion works are installed, maintained and monitoring at the Site. Surface water is diverted around the landfill footprint by a series of perimeter ditches that divert water around and away from the landfilling area. WCC uses a clay cover system when waste has reached the approved fill heights in addition to the installation/planting of vegetation cover while berms and swales divert surface water to perimeter ditches. Surface water is also managed through re-vegetation, installation of silt fencing, applying topsoil over and seeding of the finished surfaces. Storm water retention ponds have been constructed on the east and west sides of the waste mound as part of the surface water management.

The existing leachate management system includes an underlain system in the northwest corner of the existing waste footprint. This area is connected via perforated HDPE pipe to a perimeter leachate collection trench. It consists of a granular-filled trench and perforated drainage pipe which runs along the west and south edges of the waste mound and also extends approximately 150 metres north from the location of the pump station. An underlain leachate collection system also exists in Phase 4, 5 and 1.

As reported in the 2018 AMR, leachate quality monitoring results for 2018 indicates leachate generated at the Site is not significantly different from previous monitoring events. All leachate was pre-treated and pumped via forcemain to the City of Ottawa's sewer system for final treatment at the City's wastewater treatment plan, Robert O Pickard Environmental Centre. The AMR indicated that one Notice of Violation was issued by the City of Ottawa for a leachate overflow that occurred at the sampling manhole located on Renaud Road on September 18, 2018.

Condition 93 requires the leachate collection system piping for each stage of the landfill be inspected annually for the first five years after waste placement and then as often as future inspections indicated to be necessary. The forcemain carrying the leachate to the sewer system was flushed and cleaned three times in 2018.

A leachate spill occurred on September 18, 2018 at WCC's sampling manhole located in the east shoulder of Renaud Road, at the intersection of Page Road. The spill of leachate was caused by blockage in the discharge pipe which connects to the City's system. The City of Ottawa's on contract spill response company NCM responded dislodging the blockage using a vacuum truck. WCC also shut down their system at approximately 9:20 p.m. WCC estimated that approximately 65 m3 of leachate spilled to the road surface and to a grassed area immediately adjacent to the manhole. Leachate also entered catchbasins along Renaud Road which discharge to a stormwater retention pond.

The cause of the blockage was likely related to the forcemain cleanout performed by RSR Environment Inc. that had taken place earlier in the day on September 18th. RSR Environment completed a pump sequence to verify the systen was operating and flowing without obstruction. During the 2018 inspection, it was reported that WCC updated their Forcemain Cleanout SOP to include monitoring at the manhole after the clean-out procedure to ensure this type of incident does not occur again. Mr. Huneault reported that WCC is now monitoring the manhole on a weekly basis. The biannual clean-up procedure has not been yet been updated to include the contingency plan of testing for two days to ensure the leachate forcemain is flowing as expected. Please refer to Section 6.0 Other Inspection Findings.

2.9 METHANE GAS CONTROL SYSTEM:

Specifics:
Condition 84 requires that any buildings or structures at the Site contain adequate ventilation systems to relieve any possible landfill gas accumulation. Routine monitoring for explosive methane gas levels shall be conducted in all buildings or structures at the Site, especially enclosed structures which at times are occupied by people. WCC shall ensure landfill gas alarms are installed and working properly in all existing and proposed Site buildings. It was reported that monitoring is completed monthly and all associated equipment is calibrated by the contractor Armstrong on an annual basis. The 2018 AMR (Report of Landfill Gas Monitoring, section 4.3) states that gas monitors are installed in three on-Site buildings, including the scale house and have not been triggered to date.

As part of the 2009 Landfill Site Expansion, a gas collection and flaring system was approved under ECA No. 6733-7BYS9A as an interim odour control system and is not intended for a landfill gas collection system. The construction of the system was initiated in November 2010 and the flare is now operational using three landfill gas wells to supply the gas to combust. Since the landfill gas has a methane content that will burn no supplemental natural gas supply is needed. The landfill gas odour control system was extended in the fall of 2016. An additional 7 landfill gas collection wells were installed on the east and west sides of the landfill in December 2017. WCC stated that the expansion of the landfill gas collection system was delayed as the elevation required for installation was not reached when anticipated due to wet conditions over 2017 and the reduced amount of waste received. Mr. Huneault reported that four additional landfill gas collection wells were recently installed.

Condition 110 requires annual sampling of the landfill gas according to Item 41 on Schedule A and include on sampling session during the winter when the ground is frozen. The 2017 AMR states that landfill gas monitoring was undertaken in May, August and December 2018 by GAL - methane gas was less than 5% of the Lower Explosive Limi (LEL) was found at most locations. Non-methane organic compounds do no present an emission problem at the Site.

Local residents can file complaints related to the Site through The Friends of Mer Bleue (FOMB) website. Each complaint is forwarded to executives of the FOMB, WCC, MECP and City Councillor's office. The Ministry received odour complaints through the FOMB website November 1, 2018, October 12, 2018, January 13, 2019, May 15, 2019, June 18, 2019 and July 19, 2019. WCCs documents all complaints in the AMR.

2.10 OTHER WASTES:

Specifics:
The Site utilizes last harvest at the active face for additional recyclable capabilities; an excavator with a grappler and magnet allows for easy removal of metals, wood and bulky items. The wood and metals are recovered and moved to a recycling area.

Condition 37 allows House Hazardous Waste (HHW) events. The residential sources (generators) must bring their own wastes to the Site. The wastes are to be received by a hazardous waste carrier permitted through a valid approval to receive, temporarily store and transport HHW to an approved waste disposal Site. All HHW collected by the hazardous waste carrier must be removed from the Site within 24 hours of the completion of the household hazardous waste collection event. WCC hosted a HHW event on Sunday June 3, 2018 when the landfill was not open. The HHW event is always held on a Sunday to ensure there is no confusion between the HHW event and the landfill operations.

Condition 39 requires WCC provide a segregated area for the storage of white goods at the processing site to ensure refrigerant appliances accepted at the Site which have not been tagged by a licensed technician shall be store in a segregated clearly marked area, in an upright position. In addition, Condition 39 requires the white goods to be stored in a manner which allows for the safe handling and to allow the removal of refrigerants. Mr. Huneault confirmed two WCC employees are licensed to remove refrigerant from appliances; Vince Giamberardino (OPD expiry date in January 2024) and Simon Ricard (ODP expiry date June 2023). The binder that contains all tags was reviewed at the time of the Site inspection which showed ODPs are removed approximately 1-2 times per month. At the time of the inspection, white goods were observed to be stored mostly in an upright position, segregated with those that had been tagged. Mr. Huneault also reported that gas recovery company that picks up the freon is Wieners Wholesale Group Inc.

Condition 52 requires that WCC ensure that no more than two hundred twenty-five (225) tonnes of unprocessed and residual waste materials from processing operations shall be stored on Site at any time. Due to space restriction, the amount of unprocessed material is minimal and has never reached close to 225 tonnes.

Condition 65 requires that no waste is received, landfilled or removed from the Site unless a Site supervisor or attendant is present and supervises the operation. At the time of the Site inspection a site attendant was observed present at the active face.

Condition 66 requires that the Site is operated and maintained in a secure manner. The entrance to the Site off Navan Road has a locked gate and portions of the property are fenced. The east side of the property has an extensive ditch system where it is difficult to walk or have vehicles gain access. The south side is fenced to prevent access with snow machines while the west side has marsh land and a ditch. Along the north side of the Site there is a ditch and berm. WCC also has a security camera system and a security guard present for off hours.

Condition 67 requires a sign be installed and maintained at the entrance including the name of Site, owner, ECA number, hours of operation, allowable wastes, telephone number for complaints, 24 hour emergency number, warning against dumping outside the Site and a warning against unauthorized access. A sign meeting all the requirements was observed during the Site inspection.

Condition 70 requires the Site be operated and maintained so that dust, litter, odour, noise, vermin, vectors and traffic do no create an off-Site adverse effect. Mr. Huneault reported that vermin and vectors are not a problem at the Site but these is a pest control program at the Site. Litter is controlled with fencing that is repositioned based on the wind direction. Off-site odours are addressed in Section 2.9 of this report.

Condition 72 addresses dust control at the Site. Dust is controlled on Site by subcontracting CTM Sweeping to clean the yard and Navan Road on an as needed basis, the use a wheel wash to minimize the amount of dirt tracked to the road as well as the use WCC's own sweeper.

Conditions 76 through 83 outline the requirements to accept, handle and dispose of asbestos-containing waste at the Site. Currently WCC accepts asbestos waste from 8:00 a.m until 10:00 a.m with 24 hour notice although WCC will accept asbestos waste without the notice if it conducive to what is happening at the landfill that day. WCC ceases normal landfilling activities when asbestos is to be disposed at the active face. Asbestos waste is deposited in a pit which is then covered by either cover or waste materials to shield the workers from exposure. WCC employees wear protective equipment including masks and tyvek suits and all are provided with training to safely handle asbestos waste.

Condition 88 requires all employees that operate any aspect of the Site shall have the appropriate training. Mr Huneault reported that training is completed on a monthly basis. A summary of the training history of each employee is documented in their employee file. Training includes, but is not limited the following topics; Fire Prevention Plan and Flammable and Combustible Liquids, Asbestos, Lockout/Tagout, Confined Space, Heat Street, Cold Stress, Electrical Safety, Trench Protection, Respirator, Hearing Conservation, Material Sorting and Bailing, Material Handling, Coolant Policy, Maintenance Policy: Coolant, Fuelling, Preventative Maintenance Schedule, Heavy Equipment, Support Equipment, Battery Switch Policy, Daily Inspection Policy, Fuelling Policy as well as monthly safety meetings. All employees are also trained in the new employee handbook.

Condition 89 requires a daily inspection that includes assessing the adequacy of the daily cover material, evidence of unacceptable waste or illegal dumping, the need for dust control on working areas or access roads, unacceptable levels of odours and evidence of leachate discharge to the surface in the immediate vicinity of the working face. WCC currently conducts daily inspections for these items which are addressed immediately. Daily inspection are not currently documented as it part of the on-going operation of the Site where as weekly inspections are written reports.

Conditions 90 and 91 require a variety of items to be inspected on a weekly basis and are documented by WCC staff. Currently Mr. Huneault reviews and signs off all weekly inspections and ensures issues are rectified by not seeing the same item on the following week's report. Condition 132 requires the weekly inspection be documented and include the date and time of inspection, name, title and signature of trained personnel conducting the inspection, a listing of all the areas inspected and any deficiencies observed and recommendation for remedial action and the completion date of such action. Mr. Huneault provided an updated weekly inspection form that includes a column for corrective actions required/comments.

Condition 125 requires WCC to respond and document all complaints received at the Site. As discussed in Section 2.9 of this report, the number of complaints reduced significantly once the landfill gas collection system was expanded and operational. Section 4 of the 2018 AMR documented all of the odour complaints received.

Condition 133 requires that a record be kept of all waste refusals including the reason for the refusal and origin of the waste, if known. WCC provided the undersigned officer of fifteen occurrences of waste refusals in 2018.

Conditions 135 and 136 outline the submission and information requirements for the annual report. The 2018 AMR was received at the ODO within the specified timeline and contains the required documentation.

Condition 139.1 (1) was added to ECA A460702 in Notice No. 8 issued June 8, 2015 which states no contaminated soil other than soil impacted with petroleum hydrocarbons (PHCs), volatile petroleum compounds (VOCs, including benzene, toluene, ethylbenzene, xylenes), low molecular weigh polyaromatic hydrocarbons (PAHs, including naphthalene) may be accepted for processing at the Soil Treatment Pad. Condition 139.2(1) requires documentation from the generator showing the origin of the contaminated soils, verifying that is a solid non-hazardous waste and characterizing its contaminating constituents. WCC current practise is to analyze the contaminated soil accepted at the Site on a job by job basis. A Special Waste Profile is completed for each job, which also includes the required analytical results and is assigned a job number. Each job is segregated on the Soil Treatment Pad and labelled with the job number. The windrows with the associated job numbers were observed during the Site inspection. WCC has not accepted any contaminated soils from emergency spills response. Sampling requirements outlined in 139.3 (1) are completed and submitted to AGAT Laboratories. All treated soil is used as daily over on the Site - therefore reporting outlined in 139.6(1) has not been required (no off-Site disposal).

Ontario Regulation 347 requires landfill sites larger than 1.5 million cubic meters to report annually on the greenhouse gas reductions being achieved at the Site. The Navan Landfill meets the regulation requirements and submitted the required Landfill Data Collection Form electronically to the Ministry.

3.0 REVIEW OF PREVIOUS NON-COMPLIANCE ISSUES

The 2017 inspection did not identify any non-compliance issues.

4.0 SUMMARY OF INSPECTION FINDINGS (HEALTH/ENVIRONMENTAL IMPACT)

Was there any indication of a known or anticipated human health impact during the inspection and/or review of relevant material, related to this Ministry's mandate?
No

Specifics:

Was there any indication of a known or anticipated environmental impact during the inspection and/or review of relevant material ?
No

Specifics:

Was there any indication of a known or suspected violation of a legal requirement during the inspection and/or review of relevant material which could cause a human health impact or environmental impairment ?
No

Specifics:

Was there any indication of a potential for environmental impairment during the inspection and/or the review of relevant material ?
No

Specifics:

Was there any indication of minor administrative non-compliance?
No

Specifics:

Executive Summary

This report serves as the landfill gas (LFG) monitoring portion of the 2019 site operations and monitoring report and presents the results of LFG monitoring activities carried out during 2019 at the Waste Connections of Canada (WCC) Navan Waste Recycling and Disposal Facility (the WCC Navan Facility). This report has been prepared to fulfill the reporting requirements outlined in Condition 110 of Environmental Compliance Approval No. A460702 dated April 16, 2009.

The following executive summary highlights key points only; for complete information and findings it is necessary for the reader to examine the complete report.

LFG monitoring was undertaken in June, August and December 2019. At most locations monitored, methane gas was less than 5 percent (%) of the Lower Explosive Limit (LEL). Non-methane organic compounds (NMOCs) do not present an emissions problem at this site. As expected, LFG is present within the leachate collection system, with methane concentrations measured in excess of 25% LEL (or 1.25% by volume for the spring session) at the following locations:

- Monitoring well OW92-8 (G15) in December 2019
- MH-10 (G-2a) in August and December 2019
- MH-9 (G3-a), MH-7 (G5-a), MH-6 (G6-a), MH-4 (G-12a), MH-3 (G13-a) and the tank truck loading station MH (G-84a) in December 2019

It is noted that no location during the spring 2019 monitoring session reported a methane concentration in excess of 25% LEL nor in excess of 1.25% by volume.

Monitoring of ambient air conditions in close proximity to point sources of LFG indicate normal atmospheric conditions with trace or non-detectable levels of LFG. According to *Ontario Regulation 232/98*, the Landfill Standards, the design of a landfill must ensure that the subsurface migration of LFG meets several conditions including:

- The concentration of methane gas below the surface of the land at the boundary of the site must be less than 2.5% by volume.
- The concentration of methane gas must be less than 1.0% by volume in any on-site building or enclosed structure.

The on-site building requirements were met by the WCC Navan Facility based on the 2019 monitoring results. Although no monitoring locations are available below surface at the property boundary, it is anticipated that the WCC Navan Facility met the property boundary requirements in 2019.

Hydrogen sulfide was not detected at any location during the 2019 monitoring events, with the exception of the following locations, which reported relatively low detections:

- Monitoring Wells OW-94-2 (G-8), 05-R3 (G-9) and MH-4 (G-12a) in June 2019
- Collector MH (G-26i) in August 2019

It is noted that an interim LFG odour control system (refer to Section 3.4) was installed in 2011 and commissioned in April 2012. Extensions to the LFG odour control system were installed in 2016, 2017 and the fall 2019. The additional vertical wells installed in 2017 and 2019 are intended to be part of the future permanent LFG collection system. The purpose of this system is to control potential odorous emissions from the site until the full-scale LFG collection system is installed at the site. The interim LFG odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical LFG extraction wells.

APPENDIX A
2009 Landfill Gas Characterization

1.0 INTRODUCTION

This report serves as the landfill gas (LFG) monitoring portion of the 2019 site operations and monitoring report and presents the results of LFG monitoring activities carried out by Golder Associates Ltd. (Golder) during 2019 at the Waste Connections of Canada (WCC) Navan Waste Recycling and Disposal Facility (the WCC Navan Facility).

The WCC Navan Facility is located at 3354 Navan Road on part of Lots 2, 3, and 4, Concession IV, Ottawa Front, in the City of Ottawa as shown in Figure 1. This site is operated under Environmental Compliance Approval (ECA) No. A460702 and Certificates of Approval (air) No. 6141-59XKF9 and No. 3536-8APNZD.

This report has been prepared to fulfill the reporting requirements outlined in Condition 110 of ECA No. A460702 dated April 16, 2009.

2.0 CHARACTERISTICS OF LANDFILL GAS AT THE WCC NAVAN FACILITY

The presence of typical LFG is indicated by a reduction in nitrogen (N_2) and oxygen (O_2) and elevated concentrations of carbon dioxide (CO_2), methane (CH_4) and hydrogen sulfide (H_2S) when compared to atmospheric air as described in the table below. The main constituents of typical LFG are CO_2, CH_4 and H_2S. Other parameters such as mercaptans and volatile organic compounds can be present in LFG but at lower concentrations. LFG at the WCC Navan Facility was characterized in 1994, in 2002 and in 2009. The average composition of WCC LFG at the monitored locations is provided in the table below. It is noted that the LFG composition presented herein is not representative of the composition in the LFG collection and flaring system. The raw data from the 1994 and 2002 characterizations is provided in Table 1 and the data from the 2009 characterization is provided in Appendix A.

Select Gases	Sea-Level Composition of Air[1] (15°C and 101 kPa) (% by Volume)	Average WCC LFG Composition November 1994 (% by Volume)	Average WCC LFG Composition June 2002 (% by Volume)	Average WCC LFG Composition 2009* (% by Volume)
Nitrogen, N_2	78.1	77.5	78.4	NM
Oxygen, O_2	20.9	19	20.6	14.6
Carbon Dioxide, CO_2	0.03	2.7	0.5	12.6
Methane, CH_4	0.0002	1.3	0.2	14.1
Trace Elements	<0.01	NM	NM	NM

Notes:

[1] Source: CRC Handbook of Chemistry and Physics by David R. Lide, Editor-in-Chief, 1997 Edition.

* The averages were calculated using data from all Maintenance Holes and cleanouts (both measured with tubing) over the six monitoring sessions.

NM – not monitored

3.0 ENGINEERING SYSTEMS

From a hydrogeological perspective, the WCC Navan Facility is favourably situated on a thick deposit of low permeability, Champlain Sea clay (Leda Clay). The site is characterized by a shallow groundwater table. This is overlain by a thin sand cover, through which gas migration can occur. The west and south perimeter drainage system put in place by WCC has been excavated through the sand deposit into the underlying clay and extends to the water table. This drainage system, combined with the natural subsoil conditions, a perimeter buffer area and constructed low permeability barrier systems are considered to have significantly reduced the potential for off-site migration of LFG. The engineering systems in place at the WCC Navan Facility to safeguard against off-site migration of methane gas are discussed below.

3.1 Buffer Area and Natural Barrier System

The WCC Navan Facility is designed with a buffer area and natural barriers. The site has a favourable hydrogeological setting whereby the site is underlain and surrounded by a thick clay deposit of low permeability. The depth below grade to the water table at the perimeter of the site is shallow. The depth of the landfill between the ground surface and the water table is less than 2.5 metres. The Ministry of the Environment, Conservation and Parks (MECP) *Guideline for Assessing Methane Hazards from Landfill Sites* (Ministry of Environment, 1987) considers that methane gas migration of any significance may extend for a distance of ten times the depth of the landfill between the ground surface and the water table. Based on site conditions, this 10:1 general rule would suggest that methane migration could extend for a distance of 25 metres. The north, west, south and east sides of the landfill footprint are surrounded by buffer zones of 30 to 70 metres, 100 metres, 10 metres and 140 metres, respectively. Note that on the south side of the landfill a 10-metre buffer zone exists between the south limits of the waste mound and the VIA Rail right-of-way (ROW) and an additional buffer strip with a width of 100 metres exists to the south of the VIA Rail ROW. These buffers would therefore provide adequate natural venting. The natural barriers and the provision of adequate buffer area present at the WCC Navan Facility are the preferred method of dealing with potential LFG migration.

3.2 Constructed Barrier System

In addition to natural barriers and buffer area, WCC has constructed low permeability clay cut-off walls, clay berms and intervening drainage trenches at the perimeter of the waste footprint. At the edge of the fill area, native sand and other pervious materials have been removed and replaced with less permeable compacted clay. These clay barriers, designed to minimize and contain the flow of leachate, also act as a barrier against the lateral migration of LFG. Presently, the constructed clay barriers exist along the northwest, west, southwest and southeast perimeters of the fill area. As development of the landfill progresses, clay barriers will be constructed along the east and northeast perimeters. In 2019, WCC continued to construct the east buffer adjacent to the waste limit of the east cell in Phase 1. An intervening trench or excavated drainage ditch with its base at an elevation lower than the base of the waste pile and/or water table is also present at the perimeter of the waste footprint and will intercept and force any methane to the atmosphere.

3.3 Passive Ventilation System

The leachate collection system, constructed along the west, south and east limits of the existing waste area, also serves as a passive ventilation system. A passive ventilation system is a system that prevents the subsurface migration of LFGs beyond the landfill property by altering the path of flow without the use of mechanical components.

It can be used as a general barrier to gas movement or as a protective measure for structures and/or vegetation. Maintenance Holes (MHs), installed at intervals of approximately 100 metres are effective in venting LFG as indicated by the results of the field monitoring (as discussed in Sections 4.4 and 5.0).

3.4 Interim Landfill Gas Odour Control System

As part of their commitment to control potential odorous emissions from the site, WCC has installed an interim LFG odour control system which will operate until the full-scale LFG collection system is installed at the site in the near future.

The interim LFG odour control system, which has been constructed within the existing landfill footprint, includes connections to the existing leachate collection system cleanouts and to existing vertical LFG extraction wells, as well as the installation of lateral and header piping, condensate management facilities, an outdoor skid-mounted abstraction plant, and a candlestick flare. During construction, some 15 leachate collection system cleanouts were excavated and the perforated pipe replaced with solid pipe and air tight connections. Tees were installed in the header pipe to allow for expansion of the interim odour control system, if required.

The interim LFG odour control system was installed in 2011 and has been operating since April 2012. Extensions to the LFG odour control system were installed in 2016, 2017 and the fall of 2019. The additional vertical wells installed in 2017 and 2019 are intended to be part of the future permanent LFG collection system.

To date, these systems have performed satisfactorily and have assisted in minimizing potential LFG problems related to the landfill operations. A permanent LFG collection system will be installed as part of the expansion of the WCC Navan Facility as the landfill cells are completed to their final elevation.

4.0 LANDFILL GAS ASSESSMENTS

4.1 Olfactive Assessment

The WCC Navan Facility is a dry waste facility and wet organic waste is not permitted for processing or disposal. Consequently, few odours are emitted from the waste pile at this site. Odours from the waste pile, when detected, are in isolated locations occurring generally from fugitive emissions at ground surface in areas of recent landfilling activity, i.e. three to ten months following waste placement. Clay cover material has been placed over the past years on areas where the final fill heights have been reached. The waste and daily/interim cover materials in areas where no clay cover has been placed are sufficiently pervious to provide good ventilation at the surface thereby preventing the accumulation of LFG. The leachate collection system constructed at the south and west perimeters of the waste footprint behave as a passive gas ventilation system. Odours resulting from LFG are, on occasion, noticeable at some of the MH openings located along the leachate collection system. These odours dissipate rapidly and are barely noticeable only a short distance from the source of the odours.

It is important to note that in compliance with the amended ECA dated April 16, 2009, the WCC Navan Facility is no longer receiving materials for composting.

Evaluation of odour is based on the subjective interpretations of WCC's on-site personnel and observations by Golder and WCC staff during site visits as well as documentation of odour complaints received from the public nearby. The site practice, when odour complaints are received at the time of the occurrence, is to carry out an investigation of the source of odour regardless of the source of origin and to follow up with the caller with the corrective measures taken or to notify them of the potential source of odour if it is deemed to be originating from an off-site source.

4.2 Visual Assessment

There are no discernible impacts on vegetation at the surface of the landfill resulting from LFG. WCC has undertaken a landscaping program at the site including seeding berms and planting trees and significant efforts have been made at the site to preserve and relocate existing vegetation. The top surface of the waste pile has not been seeded.

In the past, venting of LFG could be observed at ground surface along the west side of the landfill between MHs. The LFG venting was only noticeable once the ground surface was covered with snow. In 2019, venting of LFG at ground surface was not noticeable.

4.3 Ongoing Gas Monitoring in On-Site Buildings

Gas monitors have been installed in three on-site buildings. The monitors, that are calibrated annually, measure carbon monoxide (CO), nitrogen dioxide (NO_2) and CH_4 in the main site building, H_2S and CH_4 in the scale house, and H_2S and CH_4 in the pump station building. To date, the monitors have not detected any of these gases in the buildings.

4.4 Field Monitoring

Field monitoring with the use of portable field instruments was carried out on June 12, 2019, on August 29, 2019 and on December 17, 2019. The locations where monitoring of LFG and air quality was conducted during the last monitoring session are indicated on Figure 2. Shallow monitoring wells located along the south and north boundaries of the site were included in the monitoring program. Monitoring was also carried out at site facilities such as the leachate pump station, the maintenance garage, the weigh scale station and the leachate collection system. Other on-site locations were selected based on an olfactive and visual inspection of the site, and active landfilling operations. Some locations were selected at random. MHs that are part of the leachate collection system were included.

Monitoring for LFG was also carried out in buildings within close proximity to the landfill. These buildings are the following:

- The on-site maintenance garage
- The on-site pump station
- The on-site scale house
- WCC office at 3354 Navan Road

The ambient air at six addresses along Navan Road and two other off-site locations near the new subdivision adjacent to the site was also included in the LFG monitoring program.

Weather data was obtained from the Ottawa Airport (OTTAWA INTL A, climate ID 6106001) in Ottawa, Ontario located 17 kilometres southwest of the WCC Navan Facility for the monitoring periods of June 12, 2019; August 29, 2019 and December 17, 2019. This weather data is summarized in the table below:

Date	Temperature (°C)			Relative Humidity (%)		Precipitation (mm)			Station Pressure (kPa)			Wind During Working Hours	
	Max.	Min.	Mean	Max.	Min.	Rain	Snow	Total Precip.	Max.	Min.	Variability During Working Hours	Max Speed (km/h)	Prevail. Direct.
June 12, 2019	23.7	6.2	15.0	95	29	0.0	0.0	0.0	100.69	100.14	↓	23	S
Aug. 29, 2019	24.1	12.8	18.5	98	51	0.9	0.0	0.9	99.77	99.57	↓	21	SW
Dec.17, 2019	-2.6	-5.5	-4.1	96	83	0.0	1.8	1.1	100.58	99.46	↓	8	NE

Entered by: RPM
Checked by: YJM

The instruments used to detect and measure LFG concentrations during the various sampling events were a LANDTEC GEM-2000 Plus (during part of the spring and the full fall and winter sessions) and a LANDTEC GEM-5000 (during the other part of the spring session because the GEM-2000 Plus model was not performing optimally) Infrared Gas Analyzers.

The LANDTEC GEM-2000 Plus and the LANDTEC GEM-5000 are designed for analyzing LFG composition and calculating flow. They are handheld devices which can measure percentages of CH_4, CO_2, CO, H_2S and O_2, relative and atmospheric pressure and, in the case of the LANDTEC GEM-2000 Plus, combustible methane Lower Explosive Limit (LEL, equivalent to 5 percent (%) by volume in air for methane gas). Methane and carbon dioxide concentrations are measured by infrared gas analyzer and oxygen is measured by the galvanic cell principle. Since the LANDTEC GEM-2000 Plus was not available for the entirety of the spring session, the LEL for all locations were not reported during this session (see Table 2). Only a partial interpretation related to LEL is therefore possible for the spring session. Concentrations of CH_4 greater than 1.25% by volume are instead discussed in the next Section.

5.0 LANDFILL GAS FIELD MONITORING RESULTS

Results of the monitoring program undertaken in 2019 are presented in Table 2 for June, Table 3 for August and Table 4 for December. At most locations monitored, methane gas was less than 5% LEL. Non-Methane Organic Compounds (NMOCs) do not present an emissions problem at this site. As expected, LFG is present within the leachate collection system, with methane concentrations measured in excess of 25% LEL (or 1.25% for the spring session as indicated above) at the following locations:

- Monitoring well OW-92-8 (G15) in December 2019
- MH-10 (G-2a) in August and December 2019
- MH-9 (G3-a), MH-7 (G5-a), MH-6 (G6-a), MH-4 (G-12a), MH-3 (G13-a), and the tank truck loading station MH (G-84a) in December 2019

It is noted that no location during the spring 2019 monitoring session reported a methane concentration in excess of 25% LEL nor in excess of 1.25% by volume.

Monitoring of ambient air conditions in close proximity to point sources of LFG indicate normal atmospheric conditions with trace or non-detectable levels of LFG. According to *Ontario Regulation 232/98*, the Landfill Standards, the design of a landfill must ensure that the subsurface migration of LFG meets several conditions including:

- The concentration of methane gas below the surface of the land at the boundary of the site must be less than 2.5% by volume.
- The concentration of methane gas must be less than 1.0% by volume in any on-site building or enclosed structure.

The on-site building requirements were met at the WCC Navan Facility based on the 2019 monitoring results. Although no monitoring locations are available below surface at the property boundary, based on the discussion in Section 3.1 of this report it is anticipated that the WCC Navan Facility met the property boundary requirements in 2019.

Hydrogen sulfide was not detected at any location during the 2019 monitoring events, with the exception of the following locations, which reported relatively low concentrations:

- Monitoring Wells OW-94-2 (G-8), 05-R3 (G-9) and MH-4 (G-12a) in June 2019
- Collector MH (G-26i) in August 2019

During the 2019 monitoring events, no odours were detected by Golder technician at the WCC Navan Facility during the spring and summer monitoring sessions. During the 2019 winter monitoring session, moderate, but not offensive odours were noted at the site. Strong odours were specifically noted at gas extraction well GW-1. Historically, odours have been detected in some areas (near the active face); however, they were transient and dissipated at a short distance from the source. As previously mentioned, gas monitors installed in three on-site buildings including the scale house have not been triggered to date. The site maintains a log to record the date and time of any odour complaints. This log describes activities related to the investigation of the complaint, and the mitigative measures implemented, if required, to address concerns. In 2019, WCC personnel responded to twenty-one odour related complaints. The Public Advisory Committee subsequently mailed out four thousand notices to inform stakeholders of a public meeting organized by the Committee. A total of twelve people attended the public meeting and none of the people in attendance had submitted a complaint. Four vertical wells were installed on site in 2019 as part of the permanent LFG collection system which will help mitigate some of the odour present once connected to the current system.

6.0 ODOUR CONTROL

To ensure the WCC Navan Facility is operated in a manner that minimizes the impact from odour on the public and the natural environment, the following program is in place at the WCC Navan Facility to deal with odour issues.

6.1 Odour Monitoring

WCC has a comprehensive program for monitoring odours and for taking remedial action in the event that odours become at all problematic in the operation of the WCC Navan Facility. Any unusual odour events and any measures taken to deal with odour at the site are recorded and filed on-site.

There are no Ontario Government standards for odour. There are no agreed-upon, empirical measurement protocols or odour thresholds that may be used in the operation of a landfill or processing facility. Consequently,

the ultimate test of an effective odour-control strategy for any facility can only be that it produces no odour complaints from the surrounding community over an extended period of operation. The operators of the facility need to take preventative and other control measures to ensure that odours never reach a threshold where they can generate complaints. The best odour monitoring program available is to give responsibility to all staff working at the site to use their own senses to constantly monitor for excessive levels of odour on-site. While some level of on-site odour is normal and acceptable, it can become a problem when these same odours register off the property. As well, the character of the odour is significant. Many 'aerobic' odours may be very inoffensive, even at a significant concentration, while even very low levels of the types of odour associated with anaerobic activity may be deeply offensive.

It is normal practice at the site to monitor odours in the following way. Every morning, when staff first arrives on the site, a general inspection is undertaken of the facility. While the site manager is looking for anything untoward, the presence of any odours likely to extend beyond the perimeter of the site will be of special concern. In addition, whenever any material at the site is being disturbed by the equipment used at the facility, staff on-site periodically stand downwind of the work that is being done, and assure themselves that any odours being created are mild, indicative of fully aerobic activity, and are not likely to be carried off the property.

In the event that staff on-site believe any odours may have some potential for off-site impact, they will drive to a location off-site and downwind from the work at the facility to determine at that moment if any off-site impact can be detected. If there is a detectable off-site impact, work on the site will be stopped immediately and remedial measures will be taken (see below). If no off-site impacts are detectable, work at the site will proceed with caution, with further periodic inspections off-site. Remedial measures will again be taken as appropriate.

The key to this approach is that all staff are constantly vigilant for even mild odours produced on-site and will take actions to deal with those odours well before they become evident off-site.

A windsock and flag is installed on the site. This provides a strong visual reminder to site staff of existing wind conditions, such that they can make judgments as to the potential for off-site odours, given that day's planned activities.

No odour monitoring program is of much value unless there is a companion program to control those same odours, once they are detected. What follows is a stepped program, capable of dealing effectively with everything from the mildest odours to the most offensive. It should be noted that all of the measures described below can and are just as likely to be applied to only sections of a site, rather than to the entire site. The source of odour problems can commonly be quite localized.

6.2 Prevention

The best odour control strategy is odour prevention. If experienced staff early in the process makes the correct, preventative decisions, odour will not be an issue. Although mild odours are experienced on-site from time to time, they are mild in nature and should not be noticeable off-site.

A perimeter drainage system put in place by WCC has been excavated through the sand deposit into the underlying clay and extends below the water table. This drainage system has significantly reduced, if not eliminated, the potential for off-site migration of LFG.

Monitoring of methane gas at the landfill site is performed on three occasions per year generally during the spring, summer and late fall or winter. Results of the monitoring programs and interpretation of the data are presented in the annual Operations & Monitoring report.

A leachate pumping station has been constructed in the southeast corner of the landfill site and a forcemain connection to the municipal sewage treatment plant commenced in 2007. Presently, the disposal method of choice for leachate generated by the WCC Navan Facility is treatment at the Robert O. Pickard Environmental Centre, a waste water treatment plant. The use of leachate retention ponds has been discontinued. This eliminates the possibility of odours emanating from on-site treatment and leachate retention ponds.

As discussed in Section 3.4, an interim LFG odour control system was installed in 2011 and commissioned in April 2012. The purpose of the interim LFG odour control system is to control potential odorous emissions from the site until the full-scale LFG collection system is installed at the site. The interim LFG odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical LFG extraction wells. The system was extended in 2016, 2017 and the fall of 2019.

6.3 Masking the Odour

Principally, these additional measures will consist of using physical, biological and/or chemical methods to mask the odours on the surface of the odour source, so that none of the odours contained within are released to the environment. A number of proven masking techniques are available and can be used at the discretion of the site manager:

- Physically covering the surface of the odour source with a 15 centimetre layer of bulking material is often enough to block the release of most odours for a period of a day or more while remedial work is done;
- A number of biological inoculants are available commercially. These substances, when applied to the surface in a water solution, are felt to effectively reinforce aggressive aerobic activity on the surface by out-competing any anaerobic colonies that may be present in the near surface area. In effect, this creates a bio-filter, and biologically processes anaerobic gases as they are released; and/or,
- A number of chemical/nutrient mixtures are also available commercially. These substances, when applied to the odour source in much the same manner used with the biological inoculants, can have a very similar or even stronger effect. Manufacturers of these products claim that their compounds rapidly stimulate the growth of one desirable family of microorganisms or another, again to create a bio-filter effect.

Whatever the actual mechanism, these products have been proven effective in the field. In all cases, odour control strategies used at this level can be applied within minutes of the decision to use them, and the effects will be largely felt within 10-15 minutes of that application, if not sooner.

6.4 Isolating an Odour Source

The last strategy will consist of using additional measures to isolate and neutralize the offending odour source material. The offensive material may be removed from the problem area, landfilled and covered immediately. This isolation strategy will be used at the discretion of the site manager.

6.5 Complaints Response

In the event that an odour complaint is received, either by the City of Ottawa or the MECP, it is expected that those parties will immediately contact WCC site staff and notify them of the problem. WCC staff will take immediate steps to determine the extent of the problem and whether or not it is caused by the facility. If the source of the odour is deemed to be originating from the WCC Navan Facility, appropriate measures as described above will be taken to mitigate the odour problem and to stop the detection of odours off-site. Again, all such

measures taken will be documented and a record kept on-site. If the identity of the complainant is made known to WCC staff, staff will contact the complainant that day, listen to their description of the problem, advise them in detail of the measures taken to rectify the problem, and invite them to visit the facility at some point to see for themselves how the site is operated. WCC will also call them back in a week's time to determine whether or not they have been aware of any other odours at their location.

WCC staff has found in the past that this kind of immediate and personal attention goes a long way to building community support for a facility and builds community confidence in the management of the site.

7.0 LIMITATIONS AND USE OF REPORT

This report was prepared for the exclusive use of Waste Connections of Canada. The report, which specifically includes all tables and figures, is based on data and information collected by Golder Associates Ltd. and is based solely on the conditions of the properties at the time of the work, supplemented by historical information and data obtained by Golder Associates Ltd. as described in this report.

Golder Associates Ltd. has relied in good faith on all information provided and does not accept responsibility for any deficiency, misstatements, or inaccuracies contained in the report as a result of omissions, misinterpretation, or fraudulent acts of the persons contacted or errors or omissions in the reviewed documentation.

The assessment of environmental conditions and possible hazards at this site has been made using the results of physical measurements from a number of locations. The site conditions between sampling locations have been inferred based on conditions observed. Air quality conditions may vary from these sampled locations.

The services performed, as described in this report, were conducted in a manner consistent with that level of care and skill normally exercised by other members of the engineering and science professions currently practicing under similar conditions, subject to the time limits and financial and physical constraints applicable to the services.

Any use which a third party makes of this report, or any reliance on, or decisions to be made based on it, are the responsibilities of such third parties. Golder Associates Ltd. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

The findings and conclusions of this report are valid only as of the date of this report. If new information is discovered in future work, including excavations, borings, or other studies, Golder Associates Ltd. should be requested to re-evaluate the conclusions of this report, and to provide amendments as required.

8.0 CLOSURE

We trust this report satisfies your current requirements. If you have any further questions regarding this report, please contact the undersigned.

Technical Memorandum Regarding WCC Navan Facility Noise Monitoring 2019

GOLDER

TECHNICAL MEMORANDUM

DATE March 10, 2020 **Project No.** 18113613

TO Henri Huneault, Landfill Site Manager
Waste Connections of Canada

CC joe_tomaselli@golder.com

FROM Tomasz Nowak **EMAIL** tomasz_nowak@golder.com

WASTE CONNECTIONS OF CANADA NAVAN FACILITY NOISE MONITORING 2019

Dear Mr. Huneault:

Golder Associates Ltd. (Golder) was retained to carry out annual noise monitoring for the Waste Connections of Canada (WCC) Navan Waste Recycling and Disposal Facility (WCC Navan Facility) in the eastern portion of Ottawa, Ontario. Noise monitoring was carried out to fulfill the requirements as outlined in Section 9.5 of the Design & Operations Report Navan Landfill Site Expansion Approvals (January 2008). This memorandum provides a summary of the noise monitoring results for 2019.

Site Operations

The WCC Navan Facility is a waste management facility that handles solid, non-hazardous industrial and commercial waste (including construction and demolition waste), asbestos waste, dry non-putrescible (i.e., non-organic) domestic waste and impacted soil. The facility operates six days a week, from 7:00 am to 5:00 pm on weekdays and 8:00 am to 1:00 pm on Saturday. The existing operations allow for a maximum of 234,750 tonnes of waste per year to be landfilled with an average daily maximum of 1,500 tonnes. Figure 1 (attached) shows a key plan of the site and surrounding area.

Methodology

An annual noise monitoring program was completed in 2019 using two Larson Davis 820 sound level meters located at the nearest residential receptors (i.e., points of reception (POR(s))) to the WCC Navan Facility. Noise data was logged every hour for the duration of the monitoring period. The monitoring was carried out from September 17 to September 24, 2019. Monitoring locations are shown in Figure 1 (attached). All monitoring data is summarized in Attachment A. Weather data during the monitoring program is provided in Attachment B.

Results

Table 1 summarizes the noise monitoring results for the 2019 monitoring program.

Table 1: Summary of Daytime Noise Levels

Monitoring Site	Minimum Daytime Hourly L_{eq} (dBA)	Minimum Daytime Hourly L_{90} (dBA)	Average Daytime Hourly L_{eq} (dBA)	Average Daytime Hourly L_{90} (dBA)
Monitoring Site 1	40	35	51	44
Monitoring Site 2	46	32	55	48

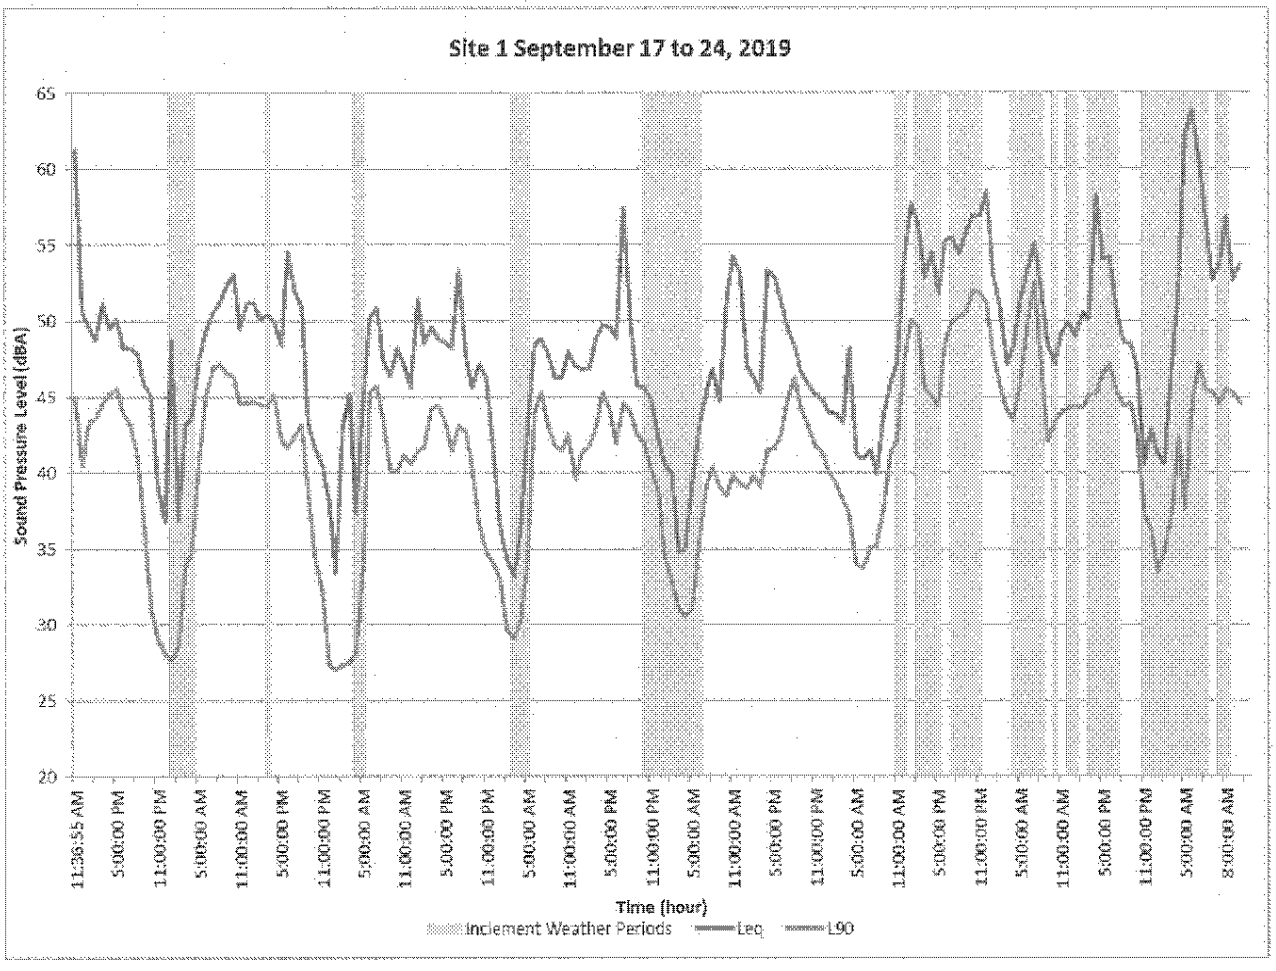
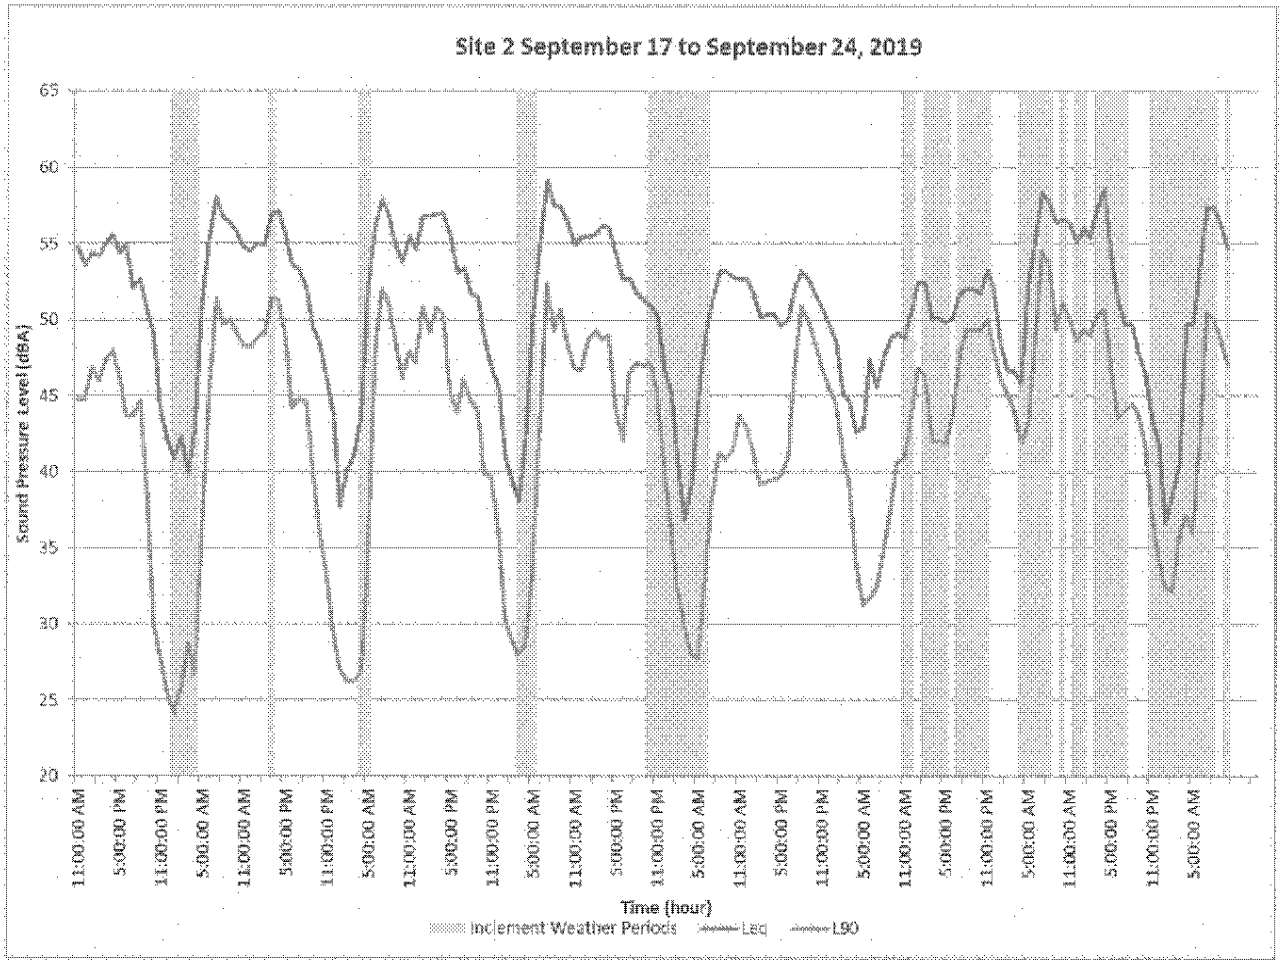
Data collected during periods of inclement weather (i.e. rain and/or high wind speeds, in excess of 18 km/h, the limit described in International Standards Organization (ISO) 1996-2 (2007) Standard *Acoustics – Description, measurement and assessment of environmental Noise – Part 2: Determination of environmental noise levels* for favourable sound propagation conditions) were excluded from the calculated levels provided in Table 1.
The periods of monitoring for which data was excluded from the calculation are shown in Plots 1 and 2 as shaded regions.



Plot 1: September 2019 Noise Monitoring Results – Monitoring Site 1



Plot 2: September 2019 Noise Monitoring Results – Monitoring Site 2

Criteria and Guidelines

The WCC Navan Facility and PORs are located on Parts of Lots 2, 3 and 4, Concession 4, Ottawa Front (formerly the City of Gloucester). The noise criteria for the WCC Navan Facility are based on the Ministry of Environment, Conservation and Parks (MECP) (formerly known as the Ministry of the Environment and Climate Change (MOECC)) Noise Guidelines for Landfill Sites (October 1998) and Noise Pollution Control (NPC) publication NPC 300 (August 2013). The Landfill Guideline outlines the sound level limit criteria for evaluating landfill site operations (i.e. landfilling activities) and NPC 300 provides the criteria for on-site stationary noise sources (i.e. non-landfilling activities). Table 2 summarizes the sound level limits at a POR due to landfill site operations.

Table 2: Applicable Noise Limits

	Daytime (07:00 – 19:00)	Night-time (19:00 – 07:00)
Landfilling Operations – 1-Hour Equivalent Sound Level – L_{eq} (dBA)	55	45
Stationary Sources – 1-Hour Equivalent Sound Level – L_{eq} (dBA)	50	45

Discussion

Based on site observations, the noise levels at the two PORs are dominated by road traffic noise along Navan Road and with audible noise from landfilling operations of the WCC Navan Facility, as confirmed during Golder staff visits (i.e., deployment and collection of the monitoring equipment). Golder's January 2008 report predicted a noise impact level for the existing site operations of the WCC Navan Facility on the surrounding PORs to be between 27 and 37 dBA due to site operations. The measured average hourly noise levels were equal to 51 dBA and 55 dBA at Monitoring Location 1 and Monitoring Location 2, respectively. These levels are at or below the noise limits established in the MECP Landfill Guidelines. It is expected that, at both sites, the noise level is predominantly influenced by traffic on the adjacent road and to a lesser extent from operations of the Facility.

Proposed Future Noise Monitoring

As discussed above, the noise levels in the area are dominated by traffic along Navan Road. Based on the findings from the 2019 and previous monitoring programs, Golder recommended that the noise monitoring at the WCC Navan Facility continue to be conducted on an annual basis with one monitoring session per year. It is understood landfill operations at the WCC Navan Facility have been substantially completed in various areas within the landfill. It is further understood, in 2020, the activities will be occurring in the north-east area, potentially closer to the identified receptor. Accordingly, Golder recommends monitoring to continue in 2020.

Closure

Golder Associates Ltd. was retained to carry out noise monitoring for Waste Connections Canada (WCC) at the WCC Navan Facility in the eastern portion of Ottawa, Ontario. The monitoring results and site observations indicate that the landfilling noise levels, expressed in average 1-hour Leq is observed to be below the noise limit at both monitoring sites. Based on these results, the operations of the WCC Navan Facility are expected to be operating in compliance with the MECP Landfill Guideline and NPC 300 limits as summarized in Table 2, where applicable.

If you have any further questions or concerns, please do not hesitate to contact the undersigned at your earliest convenience.

APPENDIX B

Weather Data September 17 to 24, 2019

Station Name	OTTAWA INT'L
Province	ONTARIO
Latitude	45.32
Longitude	-75.67
Elevation	114
Climate Identifier	6106001
WMO Identifier	71628
TC Identifier	YOW

All times are specified in Local Standard Time (LST). Add 1 hour to adjust for Daylight Saving Time where and when it is observed.

Table 1: Weather Data September 17 to September 24, 2019

2019
OPERATIONS AND MONITORING REPORT

Waste Connections of Canada Inc.
NAVAN WASTE RECYCLING AND DISPOSAL FACILITY
3354 Navan Road, Ottawa, Ontario

March, 2020

EXECUTIVE SUMMARY

The Navan Waste Recycling and Disposal Facility is a 91.87 ha waste management facility that includes a 40 ha landfill as well as processing (recycling) operations. The Site is located in the east end of the City of Ottawa (formerly the City of Gloucester) and is owned and operated by Waste Connections of Canada Inc. (WCC).

The site currently operates under amended Environmental Compliance Approval (ECA) for a waste disposal site (ECA # A460702) re-issued April 16th, 2009 with subsequent amendments (Notices 1 through 11) as well as an ECA for Industrial Sewage Works, ECA # 5616-86NKNW amendment dated June 29th, 2010 and ECA Air # 3536-8APNZD amendment dated November 24th, 2010 and ECA # 4024-9WFQE5 dated June 8th, 2015 and ECA # 2427-AETKQ5 dated November 14, 2016. The waste ECA also incorporates and makes reference to the Design and Operations (D&O) Report for the Site prepared by Golder Associates and dated January 2008.

The Facility is approved to receive solid non-hazardous and asbestos waste, excluding putrescible waste. Landfilling is restricted to waste generated within the Province of Ontario, excluding the City of Toronto. The site includes a processing facility for the recycling of waste materials and treatment of hydrocarbon impacted soils. The processing site is approved to receive solid non-hazardous waste, excluding putrescible waste, generated within the Outaouais Region of the Province of Quebec and within the Province of Ontario, excluding the City of Toronto. The site is also approved to host household hazardous waste (HHW) day events whereby the waste is received by a carrier approved through valid certificates of approval to receive, temporarily store and transport HHW to an approved waste disposal site. Other than during HHW events, no hazardous or liquid industrial wastes, as defined in O. Reg. 347, R.R.O. 1990, are permitted at the site. Most of the waste handled at the Site is generated within the City of Ottawa and neighbouring municipalities.

In 2019, a total of 428,386 tonnes of materials entered the site. Of this total, 222,976 tonnes (52.05%) were received as landfill material; 11,025 tonnes (2.57%) were recycled and removed from the site; and an estimated 37 tonnes (0.01%) were waste materials rejected and removed from the site by WCC for alternative disposal at another licensed facility. Other materials received for re-use on site included 5,949 tonnes (1.39%) of rock, brick, shingles, concrete and rubble re-used as aggregate for road construction; 11,151 tonnes (2.60%) of clean fill, topsoil, and asphalt re-used on site for final grading, road/pad construction and engineered fill; 67,249 tonnes (15.70%) of treated soils re-used for final cover and structural fill in the east buffer area; and 110,000 tonnes (25.68%) of special materials such as storm sewer screenings and impacted non-hazardous soils received at the site for re-use as daily cover material.

Golder Associates Ltd. estimated the air space used by measuring the volumetric changes between topographic mapping generated from aerial photography obtained on April 30th 2019 and the previous year on May 1st 2018. The net estimated air space used (ASU) between the last two aerial survey dates was reported to be 235,639 m^3. Records indicate that the ASU during that period of time was consumed by approximately 347,329 tonnes of waste, daily cover material and other materials resulting in a density calculation of 1.47 tonnes/m^3 and a five year average density of 1.42 tonnes/m^3. Air space used was also calculated based on assigning assumed waste densities to the various waste streams received and

landfilled, cover material and re-used materials placed within the air space from May 1st to December 31st, 2019. Using this approach, it is estimated that approximately 227,938 m^3 of remaining air space was used and excludes materials diverted off site for recycling and some materials re-used outside the air space. Based on this approach, the weighted average of the in-place density for all of the materials used in the air space calculation was estimated to be 1.18 tonnes/m^3. The variance in density calculations could be attributed to factors such as cell excavation and settlement which influence the year over year volume calculations. The air space remaining as of January 1st, 2020 was estimated to be 1,896,722 m^3.

Under the present Environmental Compliance Approval (ECA), the life expectancy remaining for the Navan Waste Recycling and Disposal Facility as of January 1st, 2020 is estimated to be 6.5 yrs (2026) to 7.9 years (2027) based on future projected maximum annual waste receipts for landfilling including daily cover of 344,750 tonnes and a waste density varying from 1.18 to 1.42 tonnes/m^3. The actual life of the landfill will vary based on annual fill rates, in-place waste densities, waste diversion and recycling initiatives at the Facility, and the rate of air space development.

Diversion through the reuse and recycling of resources is a key activity in the on-going management and preservation of disposal capacity at the Navan Facility. For example, all daily and intermediate cover needs are met by substituting the use of virgin soils with the re-use of significant quantities of impacted soils. Brick, concrete, asphalt and rubble are also recovered for re-use each year in the construction of access roads. Roofing shingles free of paper and other debris are also re-used on site as a sub-base for roads and pads over which a base of aggregate or recycled asphalt is placed. In addition, steel, aluminum, wood, tires and white goods are recovered daily from the active face for recycling. Recycling of E-waste and drywall was continued in 2019 as a service to the local community. Hydrocarbon contaminated soils treated in 2019 were re-used at the site as final cover material and structural fill within the east buffer area.

Materials received by the Navan Waste Recycling and Disposal Facility are those which IC&I generators have generally deemed to be waste and of no further value (i.e., post diversion at the source). Many of the waste generators serviced by waste collection contractors who bring waste to the Site also divert materials from landfill at their place of business prior to collection. Recycling within the IC&I sector is regulated by the Ministry of the Environment, Conservation and Parks under Regulations 101, 103 and 104. While the Site receives post-diversion waste materials from the IC&I sector, WCC has procedures in place to screen the incoming waste for recyclable material in what is known as a "last chance harvest" which is a "positive" sort where the recyclable item must be removed from the mixed waste mass. In this case, the majority of the material is not recyclable (i.e. it is waste). This is very different than recycling from "source separated" material, which results in a "negative" sort, where the waste components are removed from what is predominantly recyclable material. WCC also encourages and receives "clean" recyclable materials such as drywall, metal, electronics and glass where such materials can be shipped to market in bulk in efforts to make the recycling of such materials more economically viable.

The Navan Waste Recycling and Disposal Facility diverted over 93,374 tonnes of material from disposal in 2019, and over 407,384 tonnes during the past 5 years. For 2019, this represents a "last chance harvest" diversion rate of 29.5 % and excludes the re-use of impacted soils for daily cover material. This is in addition to the 17%-18% diversion rate for IC&I waste considered to occur at the source. WCC will continue to improve waste diversion and recycling initiatives at the Navan Facility and pursue economically viable waste diversion opportunities to help the local community and WCC clients achieve a better IC&I recycling rate.

Significant activities and capital works undertaken between January 1st and December 31st, 2019 included active landfilling in the Phase 4 and Phase 6 areas of the site (refer to Figure 2.4); excavation of the east cell

identified as Phase 6 was completed; continued recycling operations at the facility with treatment of hydrocarbon impacted soils; pre-treatment and disposal of collected leachate to ROPEC for off-site treatment; retained Dillon Consulting Limited to undertake Airborne Contaminant Discharge Monitoring and Reporting requirements for the landfill site as well as the National Pollutants Release Inventory and Green House Gas reporting; retained Golder Associates to carry out surface water, groundwater, leachate, gas and noise monitoring and reporting programs; hosted a Hazardous Waste Day event for the City of Ottawa; added clay cover to completed fill areas of the landfill; retained Base Mapping to undertake aerial photos and prepare topographic mapping of the site; constructed four additional vertical landfill gas wells in the Phase 4 area; and, constructed a large diameter culvert in the surface water drainage ditch at the north and northeast corner of the waste cell in the Phase 6 area.

Leachate generated by the landfill is collected by a drainage system consisting of three separate components that gravity flow to a leachate treatment and pumping station located at the southeast corner of the waste pile and a fourth located in the east cell that is pumped to the on-site treatment station. Presently, the disposal method of choice for the pre-treated leachate is direct discharge to the City sewer system via approximately 2 km of forcemain. In 2019, a total of 148,817 m^3 of pre-treated leachate was discharged to the City of Ottawa wastewater system, a 46.1% increase over 2018. The increase is attributed to increased precipitation in 2019 and the collection of leachate from the east cells in Phase 1 and Phase 6. There were no issues reported with the operation of the leachate treatment and pumping system in 2019.

The WCC Facility is ideally situated on a thick deposit of Champlain Sea Clay (Leda Clay). The clay deposit at this site ranges from 22 metres to greater than 33 metres in depth. A clay ridge that cuts across the site rises approximately 18 m above the floor of an abandoned Ottawa River Channel. This results in surface water and shallow groundwater flowing in a southward direction. The Site is located on the northern fringe of the Mer Bleue Bog, a well known salt water bog that is an Area of National Scientific Interest (ANSI). These natural features are ideal for the control and monitoring of leachate at the site.

Environmental control systems and operational activities that include the operation and maintenance of an elaborate perimeter leachate collection system (LCS) and surface water diversion works are monitored in accordance with the conditions of the ECA. Monitoring carried out to identify areas of environmental concern includes measuring water quality parameters in surface water and in groundwater at the site's boundary as well as in the leachate generated by the landfill. Monitoring for the presence of landfill gas was also carried out. In addition, sediment quality monitoring at three locations within the Mer Bleue Bog that was started in 2000 at the request of the National Capital Commission (NCC) was continued. The monitoring program carried out in 2019 was a continuation of the monitoring program already in place for this site.

Based on the groundwater levels obtained during the 2019 monitoring program, no significant change in groundwater flow patterns has been observed.

Groundwater at the Navan Waste Recycling and Disposal Facility is monitored within four stratigraphic units identified as a shallow surface sand layer, an upper weathered clay zone, an intact (unweathered) deposit of clay and a glacial till/upper bedrock zone. Monitoring wells are present in each of these units up-gradient, at the down-gradient edge of the waste pile (used to assess compliance) and further down-gradient of the landfill within the buffer zone.

The objectives of the 2019 Environmental Monitoring Program were to comply with the annual monitoring and reporting requirements stipulated in Conditions 109, 112, 135 and 136 of ECA No. A460702; to assess any potential impacts on water quality at the site resulting from landfill operations; to continue the monitoring of water quality for key parameters at target locations up-gradient and down-gradient from the Facility; to document the chemical composition of groundwater and surface water in the vicinity of the Facility; to assess site compliance with site specific trigger levels relating to groundwater impacts due to leachate; and to document the chemical composition of sediment at three locations in the Mer Bleue Bog.

The hydrogeology of the site indicates a recharge area north of the landfill having a downward groundwater flow component. South of the site, the hydrogeology indicates a typical discharge area having a slight upward groundwater flow component. In general, shallow groundwater quality is variable, but a distinction is noted between groundwater quality up-gradient and down-gradient of the landfill in the weathered clay. Groundwater in the intact clay deposit up-gradient of the landfill is also slightly different from down-gradient groundwater quality. In the glacial till/ upper bedrock groundwater zone, only minor differences exist in the groundwater quality across the site.

The Ministry of the Environment, Conservation and Parks (MECP) has stated that the Reasonable Use Guideline is not applicable at this site. A compliance assessment of groundwater quality was completed using the accepted groundwater and surface water trigger mechanism (Golder, 2007b). The Leachate Indicator Parameters at all groundwater monitoring locations immediately down-gradient from the landfill which are used to assess compliance were graphed and visually checked for exceedances of the 1998 to 2018 background range.

Leachate quality monitoring results for 2019 indicate that leachate generated at the WCC Navan Facility is not significantly different from previous monitoring events. Leachate at the WCC Navan Facility continues to be relatively weak wastewater when compared to municipal landfill leachate.

Trigger concentrations exceedances were reported in 2018. As a result, in accordance with ECA Condition 123 (a), WCC informed the MECP Ottawa District Office of these exceedances in a phone call on March 6, 2019. WCC presented a proposed course of action to address these exceedances and implemented it in 2019, in a continuing effort to achieve a drained state in the leachate collection system.

In 2019, only one trigger exceedance of the background range was reported: it was for magnesium at MW92-10, in the weathered clay stratigraphic unit. No other continued increase in concentration for other parameters beyond the background range was reported in 2019 in the sand stratigraphic unit or the weathered clay stratigraphic unit, due to stabilizing or decreasing concentrations following WCC actions.

In a continuing effort to achieve a drained state in the leachate collection system, WCC intends to proactively maintain the forcemain in good working condition and acquired a spare 35 horsepower leachate pump to reduce down time when a pump requires servicing. Discharge pumps were already upgraded in the fall of 2011 from 20 horsepower to 35 horsepower in an effort to achieve and maintain a discharge of 17 litres per second. Treatment modifications were commissioned in 2012, increasing pumping capability, which resulted in the ability to maintain the leachate collection system in as much a drained state as possible and to better manage the peak discharge periods. A similar course of action is proposed to be followed in 2020.

Results from the upcoming spring 2020 monitoring session will be analyzed to determine if the effect of these actions are detected in groundwater quality with a decrease in concentrations of Leachate Indicator Parameters at trigger locations, including in the intact clay and glacial till/upper bedrock units. At that point, the need for a formal contingency plan will be assessed in collaboration with the MECP.

The Mer Bleue Bog is located immediately south of the site. Surface water samples are collected in the drainage course to the east, the west and in the perimeter of the Mer Bleue Bog. Surface water data at the WCC Navan Facility is variable over time and the Mer Bleue Bog surface water quality is poor. The WCC Navan Facility is an engineered landfill site; therefore, an excursion of leachate would be apparent in the underlying stratigraphic units prior to a surface water impact. As such, a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. A site-specific groundwater based trigger mechanism is the appropriate approach for the WCC Navan Facility.

Sediment samples were collected at three locations within the Mer Bleue Bog as per an agreement with the National Capital Commission (NCC). In general, parameter concentrations measured in the sediment were similar to previously reported concentrations.

The peat deposit in the Mer Bleue Bog predates any human activity in the area. Having filtered hundreds of years of surface runoff water into the perimeter portion of the bog, it should not be surprising to find contaminants in this natural sink.

In 2002/2003, an assessment of the WCC Navan Facility operations was undertaken in support of a WCC-NCC (WSI-NCC) exchange of land parcels located south of the Navan Facility along the northern margin of the Mer Bleue. The assessment concluded that the landfill site had not caused impacts to soil, sediment, groundwater or surface water quality within the Mer Bleue. These findings were accepted by the NCC.

A Monitoring and Screening Checklist prepared and signed by a Competent Environmental Practitioner (CEP) is included with the Golder 2019 Landfill Monitoring Report attached as Appendix 'I'.

The proposed 2020 Environmental Monitoring Program is the same as was conducted in 2019, with the exception of VOCs which are proposed to be removed from the groundwater monitoring program and sediment monitoring which is proposed to be discontinued. As per Condition 109 of the ECA No. A460702, the monitoring wells located in borehole 09-1 will be sampled once per year to assess the groundwater quality in the Mer Bleue. However, due to the on-going inability to collect water samples because of the frozen conditions necessary to access the wells in the winter, efforts will be made to collect a sample during a dry period (i.e., in the summer) as has been done between 2014 and 2018 (due to dry conditions in the summer of 2019, they were sampled in the fall where possible).

Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected during the November 2018 monitoring session and will be monitored again in the spring of 2020.

In 2019, Golder Associates Ltd. (GAL) was retained to carry out the landfill gas monitoring program. The monitoring program undertaken was a continuation of the monitoring program already in place for this site

and the results of the monitoring events undertaken are presented in more detail in the GAL report provided in Appendix '2'.

LFG monitoring was undertaken in June, August and December 2019. At most locations monitored, methane gas was less than 5 percent (%) of the Lower Explosive Limit (LEL). Non-methane organic compounds (NMOCs) do not present an emissions problem at this site. As expected, LFG is present within the leachate collection system, with methane concentrations measured in excess of 25% LEL (or 1.25% by volume for the spring session) at monitoring well OW92-8 (G15) in December 2019; MH-10 (G-2a) in August and December 2019; MH-9 (G3-a), MH-7 (G5-a), MH-6 (G6-a), MH-4 (G-12a), MH-3 (G13-a) and the tank truck loading station MH (G-84a) in December 2019.

It is noted that no location during the spring 2019 monitoring session reported a methane concentration neither in excess of 25% LEL nor in excess of 1.25% by volume.

Monitoring of ambient air conditions in close proximity to point sources of LFG indicate normal atmospheric conditions with trace or non-detectable levels of LFG. According to *Ontario Regulation 232/98*, the Landfill Standards, the design of a landfill must ensure that the subsurface migration of LFG meets several conditions including:

- The concentration of methane gas below the surface of the land at the boundary of the site must be less than 2.5% by volume.
- The concentration of methane gas must be less than 1.0% by volume in any on-site building or enclosed structure.

The on-site building requirements were met by the WCC Navan Facility based on the 2019 monitoring results. Although no monitoring locations are available below surface at the property boundary, it is anticipated that the WCC Navan Facility met the property boundary requirements in 2019.

Hydrogen sulfide was not detected at any location during the 2019 monitoring events, with the exception of Monitoring Wells OW-94-2 (G-8), 05-R3 (G-9) and MH-4 (G-12a) in June 2019; collector MH (G-26i) in August 2019.

It is noted that an interim LFG odour control system was installed in 2011 and commissioned in April 2012. Extensions to the LFG odour control system were installed in the fall of 2016 and the fall of 2017 and in 2019. The additional wells installed in 2017 and 2019 are intended to be part of the future permanent LFG collection system. The purpose of this system is to control potential odorous emissions from the site. The interim LFG odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical LFG extraction wells.

During the 2019 monitoring events, no odours were detected by Golder technician at the WCC Navan Facility during the spring and summer monitoring sessions. During the 2019 winter monitoring session, moderate, but not offensive odours were noted at the site. Strong odours were specifically noted at gas extraction well GW-1. Historically, odours have been detected in some areas (near the active face); however, they were transient and dissipated at a short distance from the source. As previously mentioned, gas monitors installed in three on-site buildings including the scale house have not been triggered to date. The site maintains a log to record the date and time of any odour complaints. This log describes activities related to the investigation of the complaint, and the mitigative measures implemented, if required, to address concerns. In 2019, WCC personnel responded to twenty-one odour

related complaints. The Public Advisory Committee subsequently mailed out four thousand notices to inform stakeholders of a public meeting organized by the Committee. A total of twelve people attended the public meeting and none of the people in attendance had submitted a complaint. Four vertical wells were installed on site in 2019 as part of the permanent LFG collection system which will help mitigate some of the odour.

Dillon Consulting Limited (Dillon) was retained by Waste Connections of Canada Inc. (WCC) in 2019 to complete the following for the Navan Landfill:

- An assessment to determine the reporting requirements under the *National Pollutant Release Inventory* (NPRI) for the 2018 calendar year;
- An assessment to determine the reporting requirements under *Ontario Regulation 127/01 – Airborne Contaminant Discharge Monitoring and Reporting* (O.Reg. 127/01) for the 2018 calendar year;
- Greenhouse Gas Reduction Reporting as required under *Ontario Regulation 347*;
- An assessment to determine the reporting requirements under *Ontario Regulation 452/09 – Greenhouse Gas Emissions Reporting* (O.Reg. 452/09) and the Federal Government Greenhouse Gas Reporting Program for the 2018 calendar year; and
- Assist with data input and submission for Environment Canada's online Single Window Information Manager (SWIM) module, if required.

Based on Dillon's assessment, the Navan Landfill was required to report to NPRI for the year 2018. The total annual on-site releases and off-site transfers of the reportable NPRI Part 1, Part 2, and Part 3 substances are summarized in Section 8 of the report. Annual air releases for the NPRI Part 4 and Part 5 substances are also summarized in Section 8. An NPRI emissions report was submitted for asbestos, mercury, PM10 – particulate matter and PM2.5. The reports were made based on estimates and not measured values. Many of the parameters that are reportable are the result of handling high volumes of materials on site which are above the manufactured, processed or otherwise used reporting threshold, e.g. leachate and asbestos, but do not result in airborne emissions from the facility. The reporting of mercury was triggered by shipments of contaminated soils received at the site for disposal that contained elevated concentrations of mercury. The reporting of the emissions of PM10 was triggered by fugitive dust emissions from roads and is generally also reported by all industrial operations in Ontario due to very low thresholds.

Ontario Regulation 347 requires landfill sites larger than 1.5 million cubic meters to report annually on the greenhouse gas reductions being achieved at the site. The Navan Landfill meets the regulation requirements and submitted the required Landfill Data Collection Form electronically to the Ontario Ministry of the Environment, Conservation and Parks for 2018.

It is noted that an interim landfill gas odour control system was installed in 2011 and commissioned in April 2012. The purpose of this system is to control potential odorous emissions from the site until the full-scale landfill gas collection system is installed. The interim landfill gas odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical landfill gas extraction wells.

Based on this assessment, the Navan Landfill does not meet the reporting requirements for O.Reg. 127/01, or the Federal or Ontario GHG reporting programs and was therefore not required to report for the 2018 calendar year.

In 2020, WCC will continue to develop the landfill in a manner consistent with their past operating practices and proceed with capital projects required for the site operations as presented in the revised D&O (Golder, 2008). Over the past number of years, landfilling has progressed in a counter-clockwise pattern starting in the northwest corner of the site (area indicated as north half of Phase 3 on Figure 10.1). To date waste has been placed over the entire permitted waste footprint of the landfill as shown on Figure 10.1 with Phases 2 and 3 having been completed. In areas where significant settlement has occurred, re-grading will be carried out. In 2020, landfilling will continue in the last completed cell identified as Phase 6. Closure work will continue at the top of Phase 4 and in parts of Phase 5 and a small area in Phase 1 where final waste grades have been reached.

The development of the remaining landfill capacity in the area of Phase 6 (east cell expansion) requires the the filling and compaction of approximately 15,300 m^3 of clay material including side slopes (as of the last aerial photo taken April 30th 2019). Soil management practices will include the following:

- Excavation of clay from the Phase 5 area;
- Sediment control measures will be taken so that inactive areas such as soil stockpile side slopes are seeded; silt fences are installed as required around the perimeter of disturbed areas; and surface runoff from the stockpile areas will be channeled to the internal ditch system which will drain to the site's stormwater retention ponds.

Along with landfilling operations, other site operations expected to be carried out in 2020 will consist of the following:

- Provide additional landscaping to completed final cover areas on the south and southeast slopes of Phase 1 as well as adding additional trees in previously completed areas.
- Complete final cover construction in completed areas of fill.
- Re-align surface runoff away from fill areas and cell construction areas.
- Raise grades in the east buffer adjacent to the waste footprint on the east side and grade to direct surface runoff away from waste.
- "Last Chance Harvest" of recyclable waste will continue in the active face using specialized heavy equipment as per present practice.
- Increase efforts to sort and divert waste from small vehicles at the small vehicle drop-off area and provide incentives to clients to sort materials at source, prior to arrival at the Site.
- Establish markets for new recyclable materials and increase the types of materials to be recycled at the site.
- Enhance/research treatment of hydrocarbon impacted soils.
- Construct a working pad in the area of Phase 4 for recycling activities.
- Where required, add additional wells (horizontal and/or vertical) to the landfill gas flaring system to enhance and control fugitive gas in fill areas and odours from the landfill.
- Obtain TSSA approval of the detailed engineering design for the permanent flaring system designed by Golder Associates Ltd.
- Complete the construction of the north and northeast upper cell walls in Phase 6 to accommodate additional lifts of waste materials.

The 30 m buffer at the northern, eastern and western perimeter of the landfill and the 10m buffer at the southern perimeter will continue to be maintained as required by the ECA. Aesthetic improvements at the

site will continue to be an on-going objective.

In August 2007, WCC (WSI) received approval from the Minister of the Environment under the Environmental Assessment Act for expansion of the Navan Landfill in Ottawa, Ontario. Approval under the Ontario Environmental Protection Act (EPA) as well as other legislation were also received which culminated in the issuance of the above noted Certificates of Approval for the Site. Condition 4 of the EAA approval required that WCC (WSI) prepare an annual compliance report describing the extent of compliance with the Environmental Assessment (EA) conditions of approval and the results of WCC's compliance monitoring program (EAAB File # is EA 02 08 02). In accordance with Condition 3 of the EA approval, WCC has previously submitted a separate document proposing an EA Compliance Monitoring Program. In November 2008, the Ministry expressed its general satisfaction with the EACMR and noted outstanding requirements. It also allowed WCC (WSI) to coordinate submission of follow up EACMRs with submission of the Annual Operations and Monitoring Report. Accordingly, this EACMR is submitted as Appendix 5 to this Annual Report and covers the period January 1st to Dec. 31st, 2019. No non-compliance issues were identified during the reporting period.

1. INTRODUCTION

The Waste Connections of Canada Inc. (WCC) Navan Waste Recycling and Disposal Facility operates under the Ministry of the Environment, Conservation and Parks (MECP) Environmental Compliance Approval (ECA) for a Waste Disposal Site number A460702 as amended. The site is approved to receive solid non-hazardous and asbestos waste, excluding putrescible waste. Landfilling is restricted to waste generated within the Province of Ontario, excluding the City of Toronto. The processing site is approved to receive solid non-hazardous waste, excluding putrescible waste, generated within the Outaouais Region of the Province of Quebec and within the Province of Ontario, excluding the City of Toronto. The site is also approved to host household hazardous waste (HHW) day events whereby the waste is received by a carrier approved through valid certificates of approval to receive, temporarily store and transport HHW to an approved waste disposal site. Other than during HHW events, no hazardous or liquid industrial wastes, as defined in O.Reg 347, R.R.O. 1990, are permitted at the site. Most of the waste handled at the site is generated within the City of Ottawa and neighbouring municipalities. The site is also approved to treat contaminated soils.

This report presents the annual operating and monitoring conditions for the site to the Ministry of the Environment , Conservation and Parks (MECP) pursuant to Conditions 135 and 136 of the ECA No. A460702. The site is located in the eastern portion of Ottawa, Ontario on Part of West Half of Lot 2, Part of Lots 3 and 4, Concession IV, Ottawa Front (Parts 1, 2 and 3 on Plan 4R-19707, Parts 1 and 2 on Plan 5R-13200, Parts 1, 2, 3, 5 and 6 on Plan 5R-11073, Parts 1 and 2 on Plan 5R-11716 also referred as Parts 1, 2 and 3 on Plan 4R-21920), 3354 Navan Road, Township of Gloucester, now in the City of Ottawa, UTM Easting: 460570, UTM Northing: 5030570 at the front entrance to the site (see Key Plan, Figure 1.1 and Survey Plan, Figures 1.2 and 1.3).

1.1 BACKGROUND

The site was formerly owned and operated by Huneault Waste Mangement Ltd. which changed names in 2000 to Waste Services Inc. (WSI). In 2002 WSI was acquired by Capital Environmental Services Inc. (CERI) who kept the operating name of WSI and in July 2010 merged with BFI Canada Inc. BFI Canada Inc. changed name to Progressive Waste Solutions Canada Inc. and later merged with Waste Connections Inc. now operating as Waste Connections of Canada Inc. The Site started operations in 1960, and is operated under the Environmental Compliance Approval (ECA) No. A460702 issued by the Ministry of the Environment, Conservation and Parks (MECP). This approval officially revoked and replaced the previous approval that was dated May 12, 2006 due to the site's expansion in 2009. The following summarizes the notices that have amended ECA No. 460702:

- Notice No. 1 dated October 9, 2009: Permitted construction of base liner and leachate collection system for the east cell expansion.
- Notice No. 2 dated August 4, 2010: Widening of Navan Road.
- Notice No. 3 dated November 1, 2010: Landfill Gas Odour Control System.
- Notice No. 4 dated April 29, 2011: Financial assurance update (processing site)

- Notice No. 5 dated June 13, 2012: Financial assurance update (processing site)
- Notice No. 6 dated April 19, 2013: Financial Assurance update (processing site)
- Notice No. 7 dated February 25, 2014: Financial assurance update (landfill)
- Notice No. 8 dated June 8, 2015: Soil Treatment Pad
- Notice No. 9 dated February 1, 2016: Financial assurance update (landfill)
- Notice No. 10 dated March 14, 2017: Landfill and Processing Facility Financial Assurance
- Notice No. 11 dated June 19, 2018: Landfill and Processing Facility Financial Assurance

The site also operates under an ECA for Industrial Sewage Works, ECA # 5616-86NKNW amendment dated June 29th, 2010 and ECA Air # 3536-8APNZD amendment dated November 24th, 2010, ECA # 4024-9WFQE5 dated June 8, 2015 and ECA # 2427-AETKQ5 dated November 14, 2016. The waste ECA also incorporates and makes reference to the Design and Operations (D&O) Report for the site prepared by Golder Associates dated January 2008.

The site occupies a 91.87 hectare (ha) property (blue and green areas on Fig. 1.2) that includes a 40 ha area currently approved for recycling and disposal (red area on Fig. 1.2). Figure 1.2 depicts the existing approved waste boundaries at the site including the total land area currently owned by WCC. The site receives solid, non-hazardous industrial, commercial and institutional (IC&I) waste including construction and demolition (C&D) waste, asbestos waste, dry non-putrescible (i.e., non-organic) domestic waste and impacted soil. The approved service area for the receipt of waste for disposal is the Province of Ontario excluding the City of Toronto. The approved service area for processing/recycling and transfer includes the Province of Ontario (excluding the City of Toronto) and the Outaouais Region of the Province of Quebec (consisting of Quebec Region 7 including La Vallée-de-la-Gatineau, Pontiac, les Collines-de-l'Outaouais, Papineau and the City of Gatineau). Solid non-hazardous industrial and commercial waste including C&D waste and dry domestic recyclable waste may be received for processing. In 2015 the site was approved for the treatment of contaminated soils (ECA Amendment Notice 8) as part of its processing operations.

The remaining operating life for the landfill disposal site is influenced significantly by a number of factors such as the waste mix, the annual waste receipts, materials recycled and re-used, and the density of the in-place waste to name a few. Consequently, the remaining life has been estimated to extend to the years 2026 - 2027 based on current site approvals and projected annual waste receipts (refer to Section 5).

The expansion of the Navan Waste Recycling and Disposal Facility received approval under the Ontario Environmental Assessment Act (EAA) in 2007 and approval under the Ontario Environmental Protection Act (EPA) as well as other legislation in 2009. Major amendments to the Environmental Compliance Approval for a waste disposal site (ECA # A460702) were issued as listed above. An Environmental Compliance Approval for Industrial Sewage Works, ECA # 4816-7C7M6C issued on April 16th, 2009 was amended by ECA # 5616-86NKNW on June 29th, 2010 and an Environmental Compliance Approval Air, ECA # 6733-7BYS9A issued on April 16th, 2009 was amended by ECA # 3536-8APNZD on November 24th, 2010, by ECA # 4024-9WFQE5 on June 8th, 2015 and by ECA # 2427-AETKQ5 dated November 14, 2016.

The site is situated on a thick deposit of Leda clay and is located immediately north of a large bog (Mer Bleue). The underlying clay deposit serves as a natural liner system. Leachate management activities include the operation of a leachate collection system that consists of a perimeter collector and an underdrain system. A leachate pre-treatment/pumping station and forcemain connection to the City of Ottawa sanitary sewer system was completed in 2007 and commissioned in early 2008. It continues to be used for the management of leachate generated by the facility. Surface water is diverted around the landfill footprint through a series of berms, swales and ditches. Landfill gas generated by the facility continues to be monitored and an interim landfill gas odour control system approved by the Technical Standards and Safety Authority (TSSA) was constructed and commissioned in early 2012. Design details for a permanent landfill gas collection and enclosed flaring system has been completed by Golder Associates Ltd. and continues to be revised and updated.

1.2 *PURPOSE AND ORGANIZATION OF REPORT*

This document is referred to as the Operation and Monitoring (O&M) Report. The O&M components specifically described in this document include the following:

- Zoning and surrounding land uses;
- Existing facilities and utilities;
- Geology;
- Hydrogeology;
- Surface water flow system;
- Mer Bleue Bog;
- Description of operations (2019);
- Waste quantities and characteristics;
- Site capacity and life expectancy;
- Surface water management;
- Leachate management;
- Landfill gas management;
- Groundwater quality assessment;
- Leachate water quality assessment;
- Surface water quality assessment;
- Sediment quality assessment;
- Landfill gas monitoring results;
- Diversion of waste and other materials from disposal; and
- Proposed 2020 operations.

All O&M components described in this report have been prepared to address the Conditions of the ECA for the Navan Waste Recycling and Disposal Facility, ECA No. A460702.

1.3 *WASTE QUANTITIES*

The maximum total amount of waste that may be received at the site for disposal is controlled by the site's approved final waste contour plan. Base on the final waste contour plan approved, the estimated total air space for the site was approximately 7.6 million cubic metres. Under the current ECA (#A460702), the maximum annual amount at which the site can receive waste for disposal (excluding daily and interim cover material) is 234,750 tonnes per year. The maximum daily rate, averaged over a year, at which the site can receive waste (including daily and interim cover material), is 1500 tonnes per day. The maximum amount of unprocessed material and residuals from the processing operation that may be stored on site at any one time is 225 tonnes.

Diversion, through the reuse and recycling of resources is a key activity in the on-going management and preservation of disposal capacity at the Navan Waste Recycling and Disposal Facility. Management is constantly searching for on-site and off-site diversion or re-use opportunities to ensure that approved disposal capacity is preserved and used for the disposal of waste material of least commercial value. Given the provincial policy and regulations concerning waste diversion from landfill, the site will continue to provide critical support to the City and Province in their efforts to meet diversion targets while at the same time ensuring essential disposal capacity is available locally.

1.4 *ECA AMENDMENTS (2019)*

The site currently operates under amended Environmental Compliance Approval (ECA) for a waste disposal site (ECA # A460702) re-issued April 16th, 2009 with subsequent amendments (Notices 1 through 11). In 2019, no amendments to ECA #A460702 were required.

1.5 *ENVIRONMENTAL ASSESSMENT COMPLIANCE MONITORING REPORT (EACMR)*

In August 2007, WCC (formerly WSI) received approval from the Minister of the Environment under the Environmental Assessment Act for expansion of the Navan Landfill in Ottawa, Ontario. Approval under the Ontario Environmental Protection Act (EPA) as well as other legislation were also received which culminated in the issuance of the above noted Environmental Compliance Approval for the site. Condition 4 of the EAA approval required that WCC (WSI) prepare an annual compliance report describing the extent of compliance with the Environmental Assessment (EA) conditions of approval and the results of WCC's compliance monitoring program. In accordance with Condition 3 of the EA approval, WCC had previously submitted a separate document proposing an EA Compliance Monitoring Program. In November 2008, the Ministry expressed its general satisfaction with the EACMR and noted outstanding requirements. It also allowed WCC (WSI) to coordinate submission of follow up EACMRs with the submission of the annual Operations and Monitoring Report. Accordingly, this EACMR is submitted as Appendix 5 to this annual report and covers the period January 1st to Dec. 31st, 2019.

No non-compliance issues were identified during the 2019 reporting period.

The Ministry's EAAB File # is EA 02 08 02.

1.6 *HISTORY OF THE FACILITY*

Landfilling at the site started in the early 1960s and served, at the time, as a rural dump operation for local residents. In 1971, the Ministry of the Environment (MOE) issued an Environmental Compliance Approval (CofA No. 460702) to Mr. D. J. Huneault for disposal of industrial waste including construction and demolition waste. Currently the site receives all types of solid, non-hazardous waste for disposal excluding putrescible waste. In 1995, the CofA was amended for the operation of waste processing and composting facilities at the site. Composting operations were later suspended with the issuance of the ECA amendments in April 2009 for the landfill expansion.

Annual monitoring of groundwater and surface water was initiated in 1987 and has evolved into a comprehensive monitoring program that is reported to the MECP on an annual basis. In 1992, a leachate collection system was constructed along the down-gradient toe of the landfill and surface water diversion ditches were constructed up-gradient within the north buffer zone. Leachate was initially collected in retention ponds and re-circulated onto and into the landfill following treatment through a peat filter and constructed wetland system. Transport of leachate by tanker truck to the municipal wastewater treatment plant was initiated in 1997 following odour issues related to leachate storage ponds. Presently, leachate is pre-treated on site and discharged to the City of Ottawa sewer system for treatment at the Robert O. Pickard Environmental Centre (ROPEC). Construction of the existing leachate pre-treatment/pumping station and forcemain connection to the sanitary sewer system was completed in 2007 and commissioned in early 2008.

In 2011, a landfill gas collection and flaring system was constructed as an interim odour control system. This system was commissioned and approved in April of 2012 by the Technical Standards and Safety Authority (TSSA) and has since remained operational. In 2019, four permanent vertical gas wells were added in the Phase 4 area of the landfill.

In June of 2015, the site was approved for the treatment of contaminated soils as part of the site's processing operations and treatment of hydrocarbon impacted soils has since been on-going.

A more detailed record of milestones in the site's history is presented in Appendix 4 – Schedule 'C'.

2. SITE SETTING

2.1 *Site Location and Legal Description*

The Navan Waste Recycling and Disposal Facility is located in the eastern portion of Ottawa, Ontario on Part of West Half of Lot 2, Part of Lots 3 and 4, Concession IV, Ottawa Front at 3354 Navan Road, City of Ottawa (formerly the Township of Gloucester), UTM Easting: 460570, UTM Northing: 5030570 at the front entrance to the site. The location is indicated on the Key Plan, Figure 1.1. The latest legal survey plan for the site was registered on April 13th, 2008 as Plan 4R-21920. Parts 1, 2 and 3 of this Plan are lands owned by WCC (refer to Fig. 1.2). A narrow section of land bordering Navan Road west of the site entrance and having an area of 963 m^2 referred to as Part 1 on Plan 4R-23883 dated August 18th, 2009 was severed from WCC property as part of a Site Plan Agreement for the development of the new site facilities (refer to Fig. 1.2 and 1.3) and transferred to the City of Ottawa for the future widening of Navan Road.

2.2 *Location, Zoning, and Surrounding Land Uses*

According to the City of Ottawa's Official Plan (City of Ottawa, 2003) (Schedule B), the site is designated as Solid Waste Disposal site and is located within the Developing Community designation of the Urban Area. The East Urban Community is the southeast portion of the Orléans Community bounded by Mer Bleue Road to the east, a former Canadian Pacific Railway line (VIA Rail ROW) bordering the Mer Bleue Bog and WCC Site to the south, the National Capital Commission (NCC) Greenbelt to the west and a hydro corridor to the north. Generally, it is Urban Area (Developing Community) to the north, west and east, and Significant Wetland to the south (refer to Fig. 2.1, 2.2 and 2.3). Designations in the vicinity of the Site include: General Urban Area, including Mixed Use and Employment Areas to the north, Significant Wetland Area to the south, Natural Environment Area to the immediate west and General Rural Area further to the east.

The Developing Communities designation is used by the City to identify those areas where the detail for the development of the lands requires additional study. The planning process for the Phase 1 lands was completed when City Council approved the Phase 1 Community Development Plan (CDP) document July 2005. The Landfill Site is located within the Phase 2 study area of the East Urban Community as shown on Figures 2.1 and 2.2. The landfill site was clearly identified during the work on each of these studies. The adopted CDP includes policies to protect the landfill site from sensitive land uses being established within 500 metres without a specific study to ensure compatibility. The CDP confirmed the Official Plan policies for road widening along Navan Road and also identified the need for future linkages that would be necessary to create the municipal infrastructure (water, sanitary and storm sewers) to complete the development of the community.

In 2006 a study of a 500 m buffer area around the WCC landfill site was initiated by the city. The purpose of the study was to fulfill the Official Plan requirements and to determine whether any land would be temporarily or permanently undevelopable due to its proximity to the WCC site. The peer reviewed buffer

study was completed in the late spring of 2008. It determined that the landfill posed no constraints to development of any Phase 2 lands. However, the peer review noted that where development occurs within the buffer zone, warning clauses should be placed in the purchase and sale agreements and on title. The clause should state that there is a possibility of occasional dust and odour episodes from the landfill operations.

The City of Ottawa has now adopted a Comprehensive Zoning By-law for the entire Amalgamated City (2001). By-law 250-2008 was adopted by Council in June of 2008 and was subject to numerous appeals, none related to the landfill. In November 2008 the Ontario Municipal Board provided an Order that brought the vast majority of the Zoning By-law into effect. All of the lands in the area of the site are now subject to the provisions of this By-law.

The existing adjacent lands are predominantly residential and rural residential with some scattered non-residential uses. The land is primarily open pasture, wooded areas and the Mer Bleue Bog. Existing land uses adjacent to the site boundaries are as follows:

- **To the North:** Navan Road, formerly known as Regional Road 28, residential and light commercial developments, and a former school now used as a senior's center, medical center and pharmacy.

  The north side of Navan Road is zoned Development Reserve in the Comprehensive Zoning By-law for the City of Ottawa. A Plan of Subdivision Proposal has been approved for approximately 23 hectares of largely undeveloped land, situated north of Navan Road and extending to Renaud Road (refer to Figure 2.2) . The eastern limit of the proposed development abuts the properties of the White Street residential enclave and other undeveloped lands. The lands to the west, known as Eastboro, continue to be under development for residential purposes and include two schools.

  The senior's center property directly across from the WCC Site is in a special Development Reserve Zone (DR) that identifies the community center as an additionally permitted use. A medical center and pharmacy also occupies this property presently.

- **To the East:** woodlots, a small scrap yard, and a small recycling business (abandoned). The lands to the east are also in the DR Zone.

  There was a rezoning for 3628 Navan Road to permit a recycling business to be recognized as a Temporary Use so that an Environmental Compliance Approval could be issued for the use of a portable wood chipper. This exception to the By-law is identified as DR [1616] and it is a Temporary Use permission which expired on December 7th, 2011. This property has been identified by the City of Ottawa as the preferred location for a large storm water management pond to service the Phase 2 CDP. The design for this pond has been approved by the City of Ottawa. This site remains dormant and covered with waste presently undergoing cleanup.

  The balance of the lands to the east is in the same Development Reserve Zone (DR) which replaces the former Future Growth zone;

- **To the South:** VIA Rail right-of-way (ROW) is currently used as a recreational trail, however, railway traffic may resume in the future. This ROW is used as the zoning boundary in the comprehensive by-law. A 100 m strip of land south of the ROW is owned by WCC.

The lands south of the ROW that are within the Provincially Significant Wetland are identified as Environmental Protection (EP) in the zoning by-law. The remaining lands south of the ROW are zoned Rural in the By-law;

- **To the West:** Immediately west is a composting and soil blending operation which is zoned DR, while beyond that point are lands re-zoned and being developed for urban residential (R3VV[1286]), including Open Space (O1) and a portion that remains as a DR Exception [459]-h Zone.

Figure 2.3 summarizes the current zoning that is found in the area as shown in the Comprehensive Zoning By-law for the City of Ottawa.

The lands owned by WCC are within two defined zoning areas. The actual landfill being zoned as Heavy Industrial Exception [2] (IH[2]H(11)) and the buffer area being a separate Exception Zone to recognize its function as a buffer (IH[1483]H(11)). These are the zones found in the Comprehensive Zoning By-law. The WCC lands that lie south of the VIA Rail corridor are zoned as Environmental Protection and Rural as shown on Figure 2.3.

2.3 *Existing Site Design and Facilities*

The existing approved design and operation of the site is described in the Design and Operations report prepared by Golder Associates Ltd. for the site expansion (Golder, January 2008) and the approved Quality Assurance/Quality Control Plan and Specifications for the WSI Landfill Leachate Collection and Management System – Lateral Expansion Area (Golder, June 2009 and MOE reference Number 1851-7SUSJ9). The following sections summarize some of the current facilities and systems described therein.

2.3.1 Existing Facilities

A gated entrance from Navan Road at the north end of the site presently serves as the only access point into the landfill. The gate is locked after operating hours and monitored by security personnel. Access during operating hours is controlled by an attendant at the scales, operating from a scale house. The scale house is in close proximity to the equipment maintenance garage and administrative office building.

Internal roads are constructed and relocated as necessary to provide access to the active landfill areas and other site facilities. The internal roads are generally constructed using recycled asphalt, brick or crushed concrete over a sub-base of re-used shingles. The current approximate road network is illustrated in plan view on Figure 2.4.

A waste processing area has been built on interim-covered waste in the south-central part of the waste footprint to facilitate stockpiles of recycled and processed materials (refer to Figure 2.4). A small vehicle pad consisting of reinforced concrete retaining walls was constructed south of the scale house for the unloading and sorting of waste from small vehicles. Concrete block bunkers are available for the

separation of larger volumes of recyclable materials such as shingles, aggregates, clean fill, windshield glass, etc.

A minimum buffer width of 30 metres is maintained around the west, north and east sides of the approved waste disposal area. A 10 metre buffer is maintained between the southern limit of the waste footprint and the VIA rail corridor. Additional buffer lands owned by WCC exist to the east and west with a minimum 100 metres wide strip of land extending the full width of the site south of the VIA right-of-way (see Figure 2.4).

2.3.2 Leachate Management and Groundwater Protection System

The existing leachate management system at the Navan Waste Recycling and Disposal Facility includes an underdrain system in the northwest corner of the existing waste footprint north of Grid Line I and between Grid Lines 3 and 6 (refer to drawing 6.2). This area is connected via perforated HDPE pipe to a perimeter leachate collection trench. It consists of a granular-filled trench and perforated drainage pipe which runs along the west edge of the waste mound (Grid Line 1) and the south toe of the waste mound (between Grid Lines Q & R).

An underdrain leachate collection system also exists in the southeast corner of Phase 8 consisting of a combination of perforated collection pipes, French drains and sand drainage blanket. This drainage layer extends from Grid Line N to the south toe of the waste mound and between Grid Lines 14 and 16.

An underdrain leachate collection system also exists in the north central area of the waste footprint in the Phase 4 and 5 area of the site (refer to Fig. 2.4) consisting of a combination of perforated collection pipes, French drains and sand drainage blanket. This large drainage system extends from the north toe of the waste mound to Grid Line L and between Grid Lines 6 and 16.

The leachate drainage system in the east expansion cell (Phase 1) was constructed in 2014/2015 and consists of a network of perforated HDPE pipe, separation and filter geotextiles, a clear drainage stone layer and a sand protective layer. A similar system was constructed in 2018/19 for the new cell to the north in Phase 6. A pump station was constructed at the northwest corner of Phase 1 to assist with the drainage of the east expansion cells.

The existing leachate collection systems are illustrated in Figure 6.2 and discussed in greater detail in Section 6.3.

All leachate collected in the existing leachate collection system is designed to gravity drain or pumped to a wet well and a pre-treatment/pump station located in the south buffer near Grid Lines R-16. Pre-treatment of leachate consists of air stripping hydrogen sulphide (H_2S) and Volatile Organic Carbons (VOCs) with the use of activated carbon filters prior to discharge. During 2019, all leachate was pre-treated and pumped via forcemain to the City of Ottawa sewer system for final treatment at the City's municipal sewage treatment plant. The leachate forcemain was flushed and cleaned twice during 2019. No operational issues with the treatment and pumping station were reported in 2019.

A vertical manhole, connected to the leachate collection system in the centre of the existing waste footprint (referred to as "the central manhole"), provides an alternative point of access to evacuate leachate from this part of the leachate collection system in the event that positive drainage to the wet well

and pump station cannot be maintained due to sub-grade settlement. This manhole has been raised to an elevation of 101 metres and will require that it be raised with additional MH sections in 2019.

Access to the leachate collection pipes in the Phase 4 and 5 area (refer to Fig. 2.4) is provided via a series of cleanouts along the north side of the existing waste footprint. Cleanouts are also provided along the east perimeter for leachate collection pipe access in the east cell expansion. Access to the west and south perimeter leachate collection system is provided via a series of manholes. The system was checked for drainage to ensure proper performance of the drainage/collection system. Low permeability cover soils are currently used to minimize infiltration of precipitation into the waste column. At present, clay soil cover is located on the north, west and south facing slopes as well as the surface of completed fill areas in Phase 3 and the north part of Phase 4. Leachate containment is currently provided by a thick deposit of natural low-permeability clay soil which underlies the entire site and a constructed final clay cover.

2.3.3 Landfill Gas and Odour Management System

The Certificate of Approval (Air), ECA # 6733-7BYS9A issued on April 16th, 2009 was amended by ECA (Air) # 3536-8APNZD on November 24th, 2010 to add one (1) candlestick flare, used to combust a maximum of 0.24 actual cubic metres per second (500 scfm) of landfill gas (LFG) collected from three (3) vertical landfill gas wells and gas collected from the Leachate Collection System (refer to Fig. 8.1). Construction of the approved candlestick flare was completed at the end of 2011 and was commissioned and approved by the Technical Standards and Safety Authority (TSSA) in April of 2012. Horizontal and vertical wells were later added in the area of Phase 4, Phase 3 and Phase 1 to enhance the odour control system. Details are provided in Section 8.

A fixed line misting system powered by a portable generator was added at the end of 2017 to be on hand ready to be implemented as an emergency response system to assist in addressing odour issues and was utilized on occasion in 2019. In 2019, a 100 KV generator was acquired to enhance the continuous power supply for the misting system.

2.3.4 Surface Water Management System

The regional surface water flow system in the area of the landfill is discussed in sub-section 2.7 and existing surface water control features are shown on Figures 2.4 and 6.1. Existing controls can be summarized as follows:

a) Upstream flows originate north and northwest of the site. This flow is diverted around the landfill by ditches that exist along the north perimeter of the site buffer zones.

b) A diversion ditch has been constructed along the northern limits of the landfill that discharges into the east perimeter ditch at the northeast corner of the landfill. The east perimeter ditch conveys flows southward to storm water management ponds located at the south-east corner of the site. These ponds discharge into a perimeter ditch that flows south under the VIA ROW onto and through WCC property and drains to the Mer Bleue drainage basin.

c) Another diversion ditch has been constructed northwest of the site in the north buffer area. This ditch discharges further west into a natural drainage channel termed the west perimeter ditch

which is not well defined. Surface water from the completed west parts of the site is controlled and discharges into a storm water pond located at the northwest corner. This pond discharges into a ditch located on WCC property which drains into the west perimeter ditch. The west perimeter ditch conveys flows southward and then westward north of the VIA ROW to the Mud Creek drainage basin.

d) An east diversion ditch was constructed in accordance with South Nation Conservation Authority requirements for a fish habitat and was commissioned following approval in the fall of 2009.

e) Interim clay cover has been placed over inactive portions of the existing waste mound. Finished slopes are covered with clay soil and topsoil, graded and seeded. Soil stockpiles are also covered with topsoil and/or compost and seeded for surface water and erosion control. To protect the perimeter clay slopes against erosion, clay diversion dikes and drainage swales have been constructed to collect surface run-off above the slope. Storm water collected by the swales is directed down the landfill side slopes via rip-rap lined drainage chutes. Culverts exist at the top of each drainage chute to provide surface runoff across the perimeter access road, with the access road itself serving as a berm.

2.4 *Climatic Setting*

The landfill is located 17 km northeast of the meteorological station located at the Ottawa International Airport (OTAWA INTL. A, climate ID 6106001). Climatic conditions at the site are presented on Figures 2.5 and 2.6 and summarized as follows:

a) The average monthly temperatures in 2019, obtained from Environment Canada Atmospheric Environment Service, varied from an average low of about -12.2°C in January to an average high of 22.3°C in July with an annual average temperature of 5.9°C. The 58 year average ranges from a low of -10.5°C to a high of 20.9°C and an annual average of 6.1°C.

b) The average (1961 to 2019) annual precipitation at the Ottawa International Airport station is 921.3 millimetres. The driest month is generally February at an average of 55.6 mm and the wettest month being July at an average of 92.3 mm. Total precipitation for 2019 was 899.5 mm and ranged from a low of 39.8 mm in November to a high of 131.4 mm in October.

c) The average annual water surplus (i.e. precipitation minus evaporation) for the Ottawa vicinity is in the order of 320mm (12.5 in.). The water surplus provides an estimate of the amount of water available for infiltration into the site and for surface run-off during a 12-month period.

2.5 *Geology*

Regionally, the site is located within the Ottawa Valley clay plain at the western edge of the Prescott and Russell sand plains. The lowland region is composed of unconsolidated glacial deposits of till, varved clays and marine beds of clay and sand from the post-glacial Champlain Sea. The region is bound to the north by Precambrian formations of the Canadian Shield and underlain by interbedded Paleozoic bedrock that outcrops in ridges and scattered exposures due to faulting and downdrop fault blocks. The WCC Facility is situated on the banks of the Ottawa River Channel. The post-glacial Ottawa River Channels,

east of Ottawa, are from 3 kilometres to 10 kilometres wide and up to 18 metres deep. They are floored with clay and silt and bordered by sand deltas. Figure 2.7 shows the surficial geology of the area.

Sand deposits cover the escarpment that runs through the site. Sands are found to be 0.6 metres to 2 metres deep in the area of the Facility above the escarpment. For the most part, the sand below the escarpment has been eroded, leaving behind only a thin sand blanket. A thick (20 to 35 m) marine clay deposit underlies the entire area and has been exposed by the deep erosion channels that have cut through the escarpment and wherever the thin sand deposit has been eroded. The bedrock beneath the site is shown to consist of shale of the Billings Formation (Figure 2.8). A review of MECP water well records within the site vicinity study area indicated that the Site is underlain by limestone or shale.

2.6 *Hydrogeology*

The regional groundwater flow direction in the deep bedrock is east (Charron, 1978). In the general area of the site, groundwater flows from a north to south direction, toward the Mer Bleue bog located south of the site. Figure 2.9 indicates the groundwater flow direction and the interpreted groundwater recharge, transitional and discharge areas as described in studies undertaken for this area (A.J. Robinson and Associates Inc., 1987, Gore & Storrie Limited, 1992).

The thick clay deposit which underlies the site and surrounding area acts as an acquitard, such that lateral flow is directed through the surface sand unit and the upper weathered clay (total thickness of a few metres). Shallow groundwater flow is strongly influenced by topography, the depth of the surficial sand layer, the underlying weathered clay, the natural drainage systems and recently constructed drainage systems. Shallow groundwater flow occurs at the site generally in a north to south direction, as shown schematically on Figure 2.10.

The results of water levels measured at up-gradient wells at the site indicate the shallow water table to be typically located approximately 1 to 2 metres below ground surface with only small fluctuations in water levels indicated for recent years. A downward hydraulic gradient has been profiled up-gradient to the site. The only variation in the direction of the hydraulic gradient is indicated in the upper 5.6 metres to 10.4 metres below ground surface, from a downward gradient to an upward gradient in the weathered clay. These results may be attributed to a perched water table at the interface of the weathered clay and the intact clay. The relatively weak downward gradient from the sand to the weathered clay suggests a hydraulic interconnection between these units. The downward gradient is quite pronounced from the weathered clay down to the lower reaches of the intact clay deposit. It is interpreted that the intact clay deposit at depth beneath the landfill site acts as a barrier to groundwater flow.

The results of the water levels measured at the down-gradient wells at the site indicate the shallow groundwater table lies within the sand deposit close to the original ground surface ranging in elevation from about 68.8 metres to 70.2 metres. Seasonal variations of nearly 1 metre have been observed. The high water levels generally occur during the wet spring whereas the lower water levels are recorded during the dry summer months and fall. Unlike the up-gradient groundwater level profiles, the down-gradient profiles generally indicate a slight upward vertical gradient, although a localized weak downward gradient is observed at times between the upper 6.3 metres to 7.6 metres within the weathered clay. The upper sand and fractured clay layers appear to be hydraulically connected with near vertical or hydrostatic water level profiles. A slight upward gradient at the down-gradient

boundary of the landfill suggests there is upward vertical flow of shallow groundwater at this location which would retard the potential for leachate migration into the deeper groundwater system.

Water levels obtained further down-gradient of the landfill indicate the shallow groundwater table is close to the ground surface within the upper sand or organic deposit with artesian conditions within the clay. Hydraulic head profiles illustrate an upward gradient through most of the profile with a weak downward gradient from the sand to the weathered clay. Historically, there has been an upward gradient through the entire profile. The presence of an upward gradient suggests upward groundwater flow is occurring south of the landfill. These results may also suggest upward leaching of pore water from the Champlain Sea clay, a brackish water deposit, may be occurring at the southern boundary of the landfill. North of the landfill, downward leaching of the clay pore water is indicated.

The horizontal hydraulic gradient in the shallow sand deposit and weathered clay at this site is consistent with the relief of the property which changes in elevation by approximately 15 metres to 18 metres between the up-gradient and down-gradient boundaries of the landfill. Since the shallow water table appears to be a reflection of the original surface topography, horizontal hydraulic gradients are expected to vary between 0.7% in the plateau above the escarpment and 1.4% in the valley below. Water levels measured south of the landfill indicate shallow groundwater is flowing in a south to southwest direction with a small hydraulic gradient ranging between 0.5% and 2%. The horizontal gradients in the bog area are influenced by seasonal fluctuations in the surface water levels. Hydraulic gradients could also be influenced by the leachate collection system (LCS) located along the south toe of the landfill. Keeping the LCS drained could result in a lowering of the water table by more than 3 metres below the original grade at the southeast corner of the landfill and by 2 metres at the southwest corner. This water table lowering could significantly influence the hydraulic gradients within the waste pile near the landfill's south boundary. A clay cut-off wall on the down-gradient side of the LCS was constructed to alleviate any potential problems related to lowering of the groundwater table south of the landfill.

Water levels measured within the glacial till/upper bedrock up-gradient and down-gradient of the site indicate a difference in water levels of about 6 metres, which represents a hydraulic gradient of approximately 1% across the site within the glacial till/upper bedrock.

Many factors, such as mounding within the waste pile, the installation of the leachate collection system and the construction of waste cells with under drainage will influence the rate of groundwater flow across the site.

Within the study area MECP water well records indicate that former groundwater users obtained their groundwater from the overburden and bedrock interface. This interface is considered the main aquifer in the study area. Down-gradient of the landfill, in the direction of groundwater flow, there are no potential groundwater users and the marine clays present in the Mer Bleue bog area produce saline water.

2.7 *Surface Water Flow System*

The Navan Landfill is located on a watershed divide between two major drainage watersheds - the Rideau River watershed to the west and the South Nation River watershed to the east (see Figure 2.11). Surface runoff drains to both the east and west of the site. The east side of the site drains to the Bear Brook drainage basin, which is part of the South Nation River watershed. The west side drains into the Mud

Creek drainage basin which in turn drains into Green's Creek; part of the Rideau River watershed. The Mer Bleue bog, a unique and internationally recognized ecological feature, is located to the south of the landfill as seen on Figure 1.1.

2.8 *Mer Bleue Bog*

The Mer Bleue bog, located south of the site, is an important ecological and hydrologic feature in the Ottawa area. This 4,106 ha area was formed approximately 9,500 years ago, following the last ice age, (Frasier et al., 2001) when the Champlain Sea occupied the Ottawa Valley and laid down deep marine clay deposits. As the glaciers began to melt, a spillway channel formed south of the present day Ottawa River. Melt water flowing through the southern channel eroded the floor of the Champlain Sea. As the melt waters receded and isostatic rebound forced sea water eastward to the Atlantic Ocean, the southern channel ceased flowing and a lake formed in the present location of the Mer Bleue bog. Plant growth progressively filled in the lake, forming a raised peat dome Sphagnum bog. The peat thickness is reported to be about 6 to 7 m.

The Mer Bleue is underlain by Ordovician limestone and shale, deposited as marine sediments 445 million years ago (Brunton, 1984). The bedrock layer is deeply buried by organic deposits over the central portion of the Mer Bleue with marginal deposits of marine clay, and sand deposits along two prominent ridges. The marine clay deposits are very thick, ranging from 12 to 45 m in depth (Hobson et al., 1969). There are also sandy shoreline deposits located on the northern and southern margins of the Mer Bleue bog (Brunton, 1984).

The hydrologic features of the bog are very unusual. Being a domed bog, surface water drainage in the bog flows radially outwards from the centre towards the edges of the bog and then flows in the "lagg" along the perimeter of the bog. The elevation at the centre of the bog is approximately 70 m above sea level, sloping gradually down to about 67 m at the perimeter of the bog. Groundwater flow into the bog is very small given the low permeability of the underlying clay soils. Surface water inflow to the bog is also very limited because the contributing drainage watersheds are quite small; consequently the bog receives most of its water and nutrients in the form of atmospheric precipitation (for this reason the Mer Bleue is referred to as an "ombrotrophic bog").

Surface water flowing radially outwards from the centre of the bog enters the lagg around the perimeter of the bog which is basically a channel of standing or very slowly flowing water flowing along the perimeter of the bog. The lagg receives water from the bog and distributes it through the surrounding lands. On the western portion of the bog, drainage channels drain bog waters westward to Greens Creek. On the eastern portion of the bog, drainage from the bog ultimately discharges to Bear Brook Drain to the southwest.

Attempts were made in the late 1800's to drain portions of the bog for agricultural purposes; however, these drainage ditches no longer function because of the many beaver ponds which started up in the late 1950's. Now the water level in the Mer Bleue is at or near the surface of the bog for most of the year. The Savage Drain is an example of an agricultural drain which is quite visible in aerial photographs of the bog as a prominent linear feature on the eastern side of the bog. Flow in the drain in the northern part of the bog (nearest the landfill) is northward and then eastward along the lagg on the perimeter of the bog. There are a number of agricultural drains along the northern and eastern parts of the bog which receive surface water from the bog.

Shoreline erosion is not a concern as the surface water flow rates are nil to minimal. Flooding in the bog is also not a concern as water levels are controlled naturally through beaver dams and the ability of sphagnum to absorb large amounts of water.

In addition to its hydrologic function, the lagg is also a transition zone for plant communities and water quality, where the water regime changes from acid dominated waters in the bog to increasing calcium and basic waters.

Fraser et al., (2001) studied flow patterns and geochemistry in the peat in the Mer Bleue bog. The researchers found that vertical groundwater flow patterns in the bog alternated annually between periods of recharge and discharge in accordance with changes in precipitation, evapotranspiration and the differential head response of the lower peat layer to changes in water table. A sustained moisture deficit during the summer maintained a flow reversal for about a month until a significant rainfall raised the water table. One of the reasons that the researchers selected the Mer Bleue for their study of flow reversals was that the large peatland was isolated from the regional groundwater flow (Fraser, et al., 2001).

The surface vegetation in the Mer Bleue bog has, to some extent, become a shrub-rich bog as a result of the extensive drainage activities and peat mining of the 19th and early 20th centuries. These disturbances reduced the wetland size by 20%, accelerated the maturation of the peatland and accelerated the rate of tree establishment. The re-establishment of beaver populations along the margins of the peatland have helped restore pre-disturbance water levels, however many bog species have already been reduced (Brunton, 1992).

Ponding due to beaver activity has the potential to convert the bog vegetation to marsh communities. There is a concern about the spread of invasive and/or non-native plant species; in particular, purple loosestrife, grey birch, glossy buckthorn and European frog-bit (Wetlands International, 2001).

3. OPERATIONS - 2019

3.1 *Description of Operations*

The Navan Waste Recycling and Disposal Facility has evolved over the years from being simply a disposal site into an integrated waste management facility with increased focus on re-use and recycling.

Prior to 1981, landfilling was carried out by end-dumping over an existing east-west oriented ridge with minimal base preparation. Following an ownership change in 1981, the site was operated using an area method with waste being placed in the southern half of the landfill (i.e., below the escarpment). As-built survey information collected during the construction of the leachate collection system indicated the base elevation of the waste varied between 68 and 70 m ASL below the escarpment along the perimeter of the waste footprint. The landfill expansion approvals received in 2009 added 3,600,000 m^3 of air space bringing the total estimated waste capacity for the site to 7.6 million m^3, which included the previously approved capacity.

Prior to expansion, cell development in the northeast quadrant of the landfill footprint consisted of stripping topsoil and excavating native sand and clay soils to the required elevations for the construction of a leachate collection system. These base grades varied from 69.5 m ASL at the low point of the system in the S-E corner of the cell (Grid M-16) to approximately 73.2 m ASL at the high point of the system in the N-W corner of the cell (Grid F-7). The base grades were sloped downward at 0.5% draining in a south-easterly direction to the S-E corner of the cell (Grid M-16). The cell construction maintained gravity flow of leachate to the pump station located southeast of the waste footprint (Grid Q/R-16) entering the pump station at about elevation 67 m. Construction of the east cell expansion (Phase 1) was completed in 2015 with a leachate collection system overlying a clay floor ranging in elevation from 70.1 m to 72.1 m. The design of the leachate collection system is summarized in Section 6.3.

The landfill will continue to be developed until the upper approved final waste contours are achieved. Figure 3.1 presents the current approved top of waste grades. The final cover, which at a minimum will have a 1.0 m thickness, will be superimposed on top of the final grades. Generally, an interim clay cover is constructed immediately upon reaching the approved fill heights in an effort to reduce water infiltration and the volume of leachate generated at the site. Clay cover has been placed in areas such as the north, west, south and southeast slopes and the top of waste where final waste grades have been reached in the area of Phase 3 and the north half of Phase 4.

Active landfilling continued from January to October of 2019 in Phase 4 and was then moved to the Phase 6 east cell area in October to the end of December.

Significant activities and capital works undertaken between January 1st and December 31st, 2019 included the following:

1. Active landfilling in Phases 4 & 5 and in new east cell (Phase 6);
2. Excavated clay from the Phase 4 and Phase 5 areas (grid Lines H-K/11-14) to create air space for landfilling of waste;
3. Completion of excavation and drainage layer construction in the east cell (Phase 6);
4. On-going recycling operations at the facility;
5. Treatment of hydrocarbon contaminated soils in the material processing area of the site;
6. Continued pre-treatment of collected leachate and disposal to ROPEC for off-site treatment;
7. Retained Dillon Consulting Limited to complete the reporting requirements under the National Pollutants Release Inventory (NPRI); to determine the reporting requirements under Ontario Regulation 127/01 – Airborne Contaminant Discharge Monitoring and Reporting; to assess the Greenhouse Gas Reduction Reporting as required under Ontario Regulation 347; to determine the reporting requirements under Ontario Regulation 452/09 – Greenhouse Gas Emissions Reporting and the Federal Government Greenhouse Gas Reporting Program;
8. Retained Golder Associates to carry out surface water, groundwater, leachate, gas and noise monitoring and reporting programs;
9. Hosted a Household Hazardous Waste Day Event
10. Added clay cover to completed fill areas of the landfill;
11. Constructed a stormwater culvert along the north and northeast corner of the waste cell in Phase 6;
12. Retained Base Mapping Ltd. to undertake aerial photography and produce an updated topographic map of the site; and
13. Constructed four additional vertical wells for gas collection in Phase 4.

A brief description of the major activities and capital works follows.

3.1.1 Active Landfilling

From January to October of 2019, active landfilling took place in the Phase 4 and Phase 5 areas of the landfill. Access to the fill area was provided by a north-south access road running along the east side of grid line 14 south to Grid Line P-13 then running west to about Grid Line O-6 then turning north to about

K-6 and then east at the top of the existing waste pile in Phase 4. Excavation of existing clay cover in Phase 5 was required to create air space for landfilling of waste.

From October to the end of December of 2019, active landfilling was moved to the bottom of the newly completed east cell in Phase 6. Operations in this area focused on constructing an access road and a receiving pad for haul trucks and placing the first lift over the drainage layer. Construction of the east buffer wall against which waste could be placed was achieved with the use of treated soils at the south east corner of Phase 6. Access to the active fill area was provided by a north-south access road along the west edge of the east cell area running along the east side of grid line 14 then turning east at Grid Line J and down into the cell.

3.1.2 Cell Development

On-going excavation for the construction of the east cell defined as Phase 6 was carried out concurrently as other landfilling operations progressed. The excavated clay soils were used for the construction of berms, perimeter clay barriers, top cover material, closure, and to raise the grade along the landfill perimeter to provide more gentle side slopes. Construction of the leachate collection system on the excavated floor of the cell was completed in September of 2019.

3.1.3 Processing (recycling)

Recycling operations continued throughout 2019 making use of an excavator equipped with a grappler and magnet for the removal of metals, wood and bulky items from the waste stream received at the active face. Wood and metals recovered were moved to a recycling area located on site within the waste footprint where metals and wood are stored for further processing and/or bulk removal. A resident mobile wood grinder is used on site to reduce the wood into chips suitable for use as bio-fuel at a local mill or re-used at a local organic waste composting facility. A Duratech EJ100 Wood Grinder was used for the grinding of recycled wood into wood chips. A refrigerant recovery program established at the site continued to assist clients wanting to properly dispose of their appliances containing refrigerants. Materials such as brick, concrete, rubble, clean roofing shingles and asphalt continued to be separated for beneficial re-use in the construction of access roads, turn areas at the active face and storage pads. Other materials recycled and/or re-used at the site consist of cardboard, drywall, glass, tires, electronic waste, batteries and propane cylinders found within the waste. Further details on recycling and material volumes are provided in Section 9.

3.1.4 Contaminated Soil Treatment

The treatment of hydrocarbon contaminated soils was on-going throughout 2019 in the soil processing area of the landfill along Grid Line O between Grid Lines 9 and 13 (refer to Dwg 2.4). A total of 60,983 tonnes of treated soils meeting the target parameters were received at the treatment area and re-used as a construction fill material in the east buffer along Grid Line 20 between Grid Lines H and P in accordance with ECA conditions for the site. A total of 6,266 tonnes of impacted soils were re-used as construction material with the waste footprint of the landfill.

3.1.5 Soil Screening Plant

A METSO rock screening plant was used for the screening of rock and rubble greater than 50 mm. This plant separates materials 150 – 600 mm and 50 – 150 mm. The rock was re-used as general fill and as construction materials such as rip-rap for drainage chutes and erosion control. Material, finer than 50 mm, was landfilled or re-used as cover material. A total of 3,064 tonnes of rock was re-directed from landfill airspace.

3.1.6 Leachate Management

Leachate generated by the landfill continued to be collected through a leachate collection system and directed to an on-site leachate pre-treatment/pumping station. In 2019, leachate from the cell in Phase 1 was collected and re-directed for pre-treatment and discharge to the City of Ottawa sewer system. In 2019, a total of 148,817 m^3 of leachate was pre-treated and pumped via force main to the City of Ottawa sewer system for final treatment at the Robert. O. Pickard Environmental Centre (ROPEC), the City of Ottawa wastewater treatment plant. The forcemain conducting leachate to the sewer system was flushed and cleaned twice in 2019. No operational problems were experienced with the leachate discharge operations at the landfill in 2019.

3.1.7 Stormwater Management

Stormwater and snow melt water at the site is managed to direct surface runoff to the east and west watersheds using a series of natural and constructed ditches, swales, chutes, culverts and stormwater ponds. In 2019, a 237 m long culvert was constructed at the north and northeast corner of the cell in Phase 6. The culvert consists of a 900 mm diameter corrugated smooth interior HDPE pipe joined with bell and spigot c/w gasket and pre-fabricated concrete headwalls at both ends. A sediment trap was also constructed in front of the inlet structure.

3.1.8 Landfill Gas Monitoring

Monitoring of methane gas at the landfill site was performed by Golder Associates Ltd. on three separate occasions in 2019. Results of the monitoring programs and interpretation of the data are presented in Section 8 and Appendix '2' of this report. Construction of the candlestick flaring system for the Interim Odour Control System designed by Golder and approved by the MECP was completed in late 2011. In early 2012 the flaring system was commissioned and approved by the Technical Standards and Safety Authority (TSSA) and has since been in continuous operation.

In 2014, the landfill gas collection system was expanded to collect gas from the central manhole and from horizontal wells constructed at the top of the Phase 3 area in efforts to mitigate fugitive emissions from these areas. In 2016, additions to the gas collection system were required and five horizontal collectors were constructed. In 2017, seven vertical wells and one horizontal well were added. In 2019, four additional vertical wells were constructed in Phase 4.

Dillon Consulting Limited was retained to complete the previous year (2018) reporting requirements under the National Pollutants Release Inventory (NPRI); to determine the reporting requirements under Ontario Regulation 127/01 – Airborne Contaminant Discharge Monitoring and Reporting; to assess the Greenhouse Gas Reduction Reporting as required under Ontario Regulation 347; to determine the reporting requirements under Ontario Regulation 452/09 – Greenhouse Gas Emissions Reporting and the Federal Government Greenhouse Gas Reporting Program.

3.1.9 Noise Monitoring

Monitoring of noise levels at the WCC Navan Facility was performed by Golder Associates Ltd. at two points of reception (POR) nearest residential receptors for the period of September 17th to September 24th, 2019. Monitoring results are presented in a Technical Memorandum provided in Appendix 3. The measured average hourly noise levels were equal to 51 dBA and 55 dBA at Monitoring Location1 and Monitoring Location 2, respectively. These levels are at or below the noise limits established in the MECP Landfill Guidelines. It is expected that at both sites, the noise level is predominantly influenced by traffic on the adjacent road and to a lesser extent from landfill operations. In addition, landfill operations at the WCC Navan Facility have been substantially completed along the northwest and west areas and work at the landfill is progressing to the east, away from the receptors to the west. In 2020, landfilling will be predominantly in the northeast cell (Phase 6).

3.1.10 Surface Water, Groundwater and Leachate Monitoring

Water quality monitoring programs are carried out twice annually for groundwater, and three times per year for surface water and leachate by Golder Associates Ltd. Surface water quality monitoring events were carried out on June 20th, August 28th, and November 21st of 2019. Leachate was also sampled by Golder at the pump station on June 20th, August 28th, and November 21st of 2019. Groundwater quality monitoring was carried out on June 19th and November 20-21, 2019. Groundwater monitoring wells further in the Mer Bleue Bog were sampled on November 21st as frozen well conditions prevent winter sampling. Additional monitoring of surface water, groundwater and sediments requested by the National Capital Commission (NCC) in early 2000 was continued. Results of the monitoring programs and interpretation of the data reported by Golder Associates Ltd. are presented in Appendix '1' of this report and discussed in Section 7.

3.1.11 Household Hazardous Waste Day

A Household Hazardous Waste Day was hosted for the City of Ottawa on Sunday June 2nd, 2019. This event was managed by Drain-All Ltd. under their mobile C of A #A420013. This event was very well attended between the hours of 9:00 am and 4 pm. WCC supervisory personnel were on site for the duration of this event.

3.1.12 Closure

Closure consisting of placing clay fill material of at least 1.0m in thickness was continued where final waste grades were reached in the area of Phases 1 and 4. These areas are also used for staging excavated wet clay for drying and re-use purposes. Placing of topsoil and seeding will be carried out in these areas at a later date.

3.1.13 Aerial Photography

Base Mapping Co. Ltd. of Ottawa was again retained to undertake aerial photography of the Navan Waste Recycling and Disposal Facility. Digitized topographic maps of the site with 0.5 metre contour intervals were obtained for April 30th, 2019. The 2019 topography with 2 metre contour intervals is shown on most drawings. To date, a total of 195,440 m^2 of the waste footprint has received clay cover as shown of Figure 3.2.

3.2 *Daily Site Operations*

The site continues to be operated in accordance with the approved Design and Operations report (Golder, 2008) and the amended Certificate of Approval. Daily site operations are described in the following sub-sections.

3.2.1 Access

The site is well serviced by Regional Roads, being located on Regional Road 28, locally known as Navan Road (refer to Figure 1.1). Most of the traffic at the site is generated by commercial vehicles which access the site via Innes Road (Regional Road 30) and Navan Road. The Tenth Line Road (Regional Road 47) and Milton Road (Regional Road 31) also provide access from East Ottawa (Cumberland Township).

Access to the site is provided by one entrance located off Navan Road. The gate is kept locked after hours to restrict access. The access road is paved between Navan Road and a distance past the scale house and wheel wash station (Grid Lines C-15). A well-maintained all-weather road provides access to the designated unloading areas. Other access roads are provided throughout the site allowing access to water management systems, material stockpiles, site facilities and equipment storage areas (refer to the Site Features Plan - Figure 2.4).

3.2.2 Hours of Operation

Approved hours of operation for the receipt of waste are from 7:00 am to 6:00 pm Monday through Saturday, inclusive, however the site generally closes at 5:00 pm on week days and 1:00 pm on Saturdays and statutory holidays. The site does not receive waste prior to 7:00 am or after 6:00 pm on these days. Waste acceptance outside of these hours requires the approval of the MECP District Manager. Operating hours may vary within the approved hours. On occasion and as required, Landfill excavation and

equipment/site maintenance may occur outside these hours.

The site is secured after operating hours and includes sporadic security patrols by a security services contractor. No scavenging is permitted at the site.

3.2.3 Site Staffing

WCC routinely reviews and monitors its staffing needs for the site and adjusts the staffing level accordingly. Currently 23 fulltime equivalent employees (FTE) are employed locally at the site including management, sales, administrative, clerical, and operations personnel.

The number of employees at the landfill site is variable from time to time and is based on the workload which can be seasonal and personnel turnover. Throughout the year, co-op students are hired to perform general tasks such as grass cutting, general site clean-up, minor site maintenance work, surveying, traffic control, etc. Personnel from other WCC districts are also called upon from time to time to assist with landfill operations. When required, contractors are hired for task specific work such as maintenance, security and landscaping.

3.2.4 Equipment

The following equipment was in use at the landfill site in 2019:

1) 1- 826G & 1- 826H CATERPILLAR WASTE COMPACTOR
   - levelling; compaction; grading of waste

2) D7R CATERPILLAR BULLDOZER (c/w LANDFILL PKG)
   - levelling; placing; grading of waste

3) D6N LGP CATERPILLAR BULLDOZER
   - Levelling; compaction; grading; earth works

4) D6T XW & D6T LGP CATERPILLAR BULLDOZER
   - Levelling; compaction; grading; earth works

5) Volvo EC340DL EXCAVATOR
   - excavating; levelling; ditching; grading; soil movement; berm construction

6) CAT 330 WH EXCAVATOR c/w GRAPPLER
   - recycling; excavating; levelling; ditching; grading; soil movement; berm construction; processing; box scrape outs

7) Volvo EC220 EL EXCAVATOR c/w GRAPPLER AND MAGNET
   - recycling; excavating; levelling; ditching; grading; soil movement; berm construction; processing; box scrape outs

8) JOHN DEERE 310J BACKHOE (c/w ATTACHMENTS)
   - excavating; recycling; levelling; ditching; grading; snow removal; box scrape outs

9) CAT 420F BACKHOE (c/w ATTACHMENTS)
- excavating; levelling; ditching; grading; snow removal; box scrape outs; tree planting

10) 1 – 730 CAT ARTICULATED TRUCK
- 6-wheel drive truck / earthworks; daily cover

11) 2 - A25E VOLVO ARTICULATED TRUCK
- 6-wheel drive truck / earthworks; daily cover

12) 1 - CAT 950H LOADER
- material loading; snow removal; processing; road maintenance

13) 1 - CAT 950M LOADER
- material loading; snow removal; processing; road maintenance

14) DURATECH EJ100 WOOD GRINDER
- wood and drywall grinding

15) 1- MACK ROLL-OFF TRUCK
- on-site container management; dust control

16) 1 – FREIGHTLINER ROLL-OFF TRUCK
- on-site container management; dust control

17) PICK-UP TRUCKS AND ALL-TERRAIN VEHICLES
- site access; road sweeping; snow removal; magnetic sweeps; salting

18) 1 TON DUMP TRUCK (c/w SNOW PLOUGH)
- For general use and snow removal both on-site and off-site

19) 3-35 HP LEACHATE PUMPS
- available throughout the year for leachate management

20) 2- 100 MM GORMAN RUPP PUMPS AND ADDITIONAL GENERAL PURPOSE PUMPS
- available for the handling of leachate and surface water

21) TANKER 22.7 m^3 (5,000 GAL.)
- On-site water needs (dust control; clean roadways; flush leachate MHs etc.)

22) 100 KW GENERATOR, 40 KW GENERATOR AND 20KW GENERATOR
- Power supply for the candlestick flare
- Power supply for the odour misting system
- Pump Station backup power supply.

23) KUBOTA UTILITY VEHICLE
- Equipped with snow blowing and lawn mowing equipment.

24) ARGO UTILITY VEHICLE C/W TRACKS
- All terrain vehicle.

25) LIGHT TOWERS
- Landfill and recycling area lighting and power supply for equipment.

26) METSO SCREENING PLANT
- Screening of oversize materials from soil and rubble.

Vehicles are equipped with 2-way radio equipment along with hand held portable 2-way radios utilized for on-site communication between equipment operators, supervisors, spotter, weigh scale attendants, maintenance personnel and site office.

The size and type of equipment available on site handles the every day and long-term operation of this engineered facility. Additional equipment is brought on site as required to supplement or replace the WCC heavy equipment during repair programs or for special projects.

3.2.5 Equipment Maintenance

A maintenance building completed in 2009 is used for equipment repairs and storage of parts, tools and supplies. A comprehensive preventative maintenance program is in place and equipment maintenance is fully documented. A maintenance schedule is followed in a strict manner. WCC's own staff mechanics perform all lubrication and oil changes as well as most vehicle repairs. Qualified equipment dealers perform major repairs and warranty work when required. A daily pre-trip and post-trip inspection of all equipment in use is performed by equipment operators.

All machinery is equipped with fire suppressant and first aid equipment. First-aid stations are located at various locations on site.

On-site personnel are able to perform routine maintenance on all machinery and employees are trained to operate and maintain different pieces of equipment. A daily, weekly and monthly equipment inspection is carried out and documented for each piece of equipment. Daily records of fuel, lubrication consumption, and hours of operation are maintained.

3.2.6 Scale House and Small Vehicle Pad

Two full-time employees operate the scale house. Two 100 tonne Rice Lake scales installed in early 2009 are in operation to reduce traffic congestion on Navan Road. All vehicles are weighed upon entering and leaving the landfill. Drivers must exit their vehicle and sign the weigh bill at the scale house. The scale clerk records the name of the client, the origin of the waste (customer), the type of waste, driver identification, truck identification and notes using a grid system where the waste was placed within the landfill. All records from these transactions are maintained at the site office and recorded in WCC's computer records.

The scale clerk has contact with the site office, spotter and equipment operators at all times. The site cannot be opened unless the scale clerk and an operator/spotter are present. Rejected loads of waste are recorded and reported to the MECP and a record is kept on site.

A small vehicle unloading area was built southeast of the weigh scales to service small vehicles and promote recycling. The paved area is maintained and kept clean at all times. Concrete bunkers were added in 2012 west of the small vehicle pad to add capacity for small loads of aggregate, shingles, asphalt, metals, wood and recyclable windshield glass.

3.2.7 Site Office

Management and administrative staff work in an office/maintenance building constructed in 2009 located north of the landfill near the Navan Road site entrance. The site office is open Monday to Friday during working hours of the landfill. All records are maintained at the site office. The site office is equipped with several computers to maintain landfill records, employee information and site operation manuals. Areas of active landfilling are recorded daily and referenced to a grid system. The daily operation of the landfill is carried out from this office.

3.2.8 House Keeping and Controls

(a) Site safety

All employees have been instructed in safety procedures and a Joint Occupational Health and Safety Committee meets monthly to discuss health and safety issues at the site. Managers have been tasked as Site Safety Leaders dedicating time to safety related programs, training and safety awareness. On-site employees have completed waste handling safety courses, GHS training (Global Harmonized System of Classification and Labelling of Chemicals), confined space entry, and CPR & basic first aid training courses. On-site first-aid stations are available on the equipment, maintenance facility, scale house, pump station and site office. On-site communication allows for quick response. Emergency spill kits are available at the maintenance garage and site office. All workers have been provided with personal protective equipment (PPE) and must wear hard hats, safety boots, reflective clothing and safety glasses. All vehicles have back-up alarms. A spotter directs all traffic and machinery at the working face of the landfill.

Employees have been instructed in the handling of special materials, in particular impacted soils and asbestos, a designated waste. All employees and haulers follow a documented protocol for the handling of these materials. In brief, the procedure is as follows:

No hauler is allowed to enter the site with these materials without prior approval. All haulers of these materials must give advance warning of their coming to the site. A time slot is then assigned for receipt of the material. A designated spot for the placement of the materials is prepared. Asbestos waste is landfilled and covered without any equipment coming into contact with the waste. Disposable safety coveralls, head covers and respirators are also available on site for the handling of special wastes.

Employees have been instructed as to the types of waste allowed and materials not allowed to be received at the site. All containers must be open and void of any liquid material before they can enter the site. Closed containers are refused. Waste that is inadvertently dumped at the site is either placed back in the hauler vehicle or stored in one of WCC's boxes for later removal. Hauled materials are inspected for any

banned waste and the above procedure followed. Materials rejected from the landfill are reported to the MECP district office. Records of rejected waste and materials removed from the site are kept at the landfill site office.

(b) Scavenging control

No scavenging is permitted at the site. The spotter and equipment operators working at the active face strictly enforce this. On-site personnel carry out recycling of wood, metals and white goods in a controlled and manageable manner at the active face using heavy equipment specially equipped with a grappler and magnet. A small vehicle receiving pad is provided where waste from small vehicles can be received safely and materials can be sorted for recycling by the vehicle operator. Concrete bunkers were added to this area to further assist with the recycling of materials such as asphalt, aggregates, shingles, wood, metals and windshield glass. A program for the recovery of refrigerants is available and this service continued throughout 2019.

(c) Litter control

Litter has not been a problem at the Navan Waste Recycling and Disposal Facility because of the use of daily cover. Periodic checks are made of the finished and active areas of the site for litter. Litter fencing is maintained at the active working face and temporary fencing is maintained in areas of the landfill perimeter as a supplementary litter control measure. Fencing is cleaned of litter as required. At least twice each year WCC personnel collect litter accumulated in the ditches along Navan Road for a distance of 1 km to the east and west of the site entrance. No complaints related to litter were received in 2019.

(d) Vector and vermin control

The presence of vermin and vectors is not a problem at the site primarily due to the dry, non-putrescible nature of the waste stream. Periodic checks have proven that no problems with vermin exist at the site due to proper landfilling procedures. If vermin are detected at the site, a registered pest control company is retained to control the problem. Although some seagulls and crows do frequent the site in summer months, this is not considered a health or environmental problem because of the small numbers present. A bird scare permit has been obtained from the Ministry of Natural Resources. When required, pellet whistlers are shot into the air to control birds during business hours. Abell Pest Control was hired in 2018 to set up bait control stations at various locations throughout the landfill to monitor activity on site and continued their work throughout 2019. No complaints were received in 2019.

(e) Dust management plan

The landfill has the potential to generate fugitive dust emissions. Fugitive dust sources have been assessed in accordance with MECP guidelines. In order to minimize the potential for off-property impacts due to fugitive dust, the following practices are implemented at the site:

- Aggregate (e.g., gravel, crushed limestone) is spread over unpaved roads to reduce silt loading. Repeat applications of aggregate are done on an as-needed basis, dependent on the condition of the roads.
- Watering of unpaved roads is carried out to increase the moisture content of the surface material and reduce the potential for fugitive dust generation. Dust suppressants (e.g., calcium chloride, wood chips) are also used, depending on the ability of watering to appropriately control dust. The frequency of application of water or dust suppressants to roadways is adjusted based on road conditions, weather conditions and traffic loadings. In 2019, watering of access roads for dust suppressant with the use of an on-site water truck was carried out on 85 separate occasions throughout the dry weather months. The company also owns a backhoe equipped with a road brush for sweeping asphalted surfaces. In addition to the use of on-site equipment, mud and dirt was removed from Navan Road and on-site paved roads by a subcontractor retained to vacuum sweep/flush paved surfaces on 7 separate occasions.
- A speed limit of 15 km/h is enforced while vehicles are traveling on unpaved roads. This limit is posted on site and communicated to users of the unpaved roads.
- Where possible, travel distances to material transfers and drop points are kept as short as practical to reduce dust generation.
- A wheel wash station was constructed in 2009 east of the weigh scales and scale house to service vehicles exiting the landfill and to reduce mud drag-out onto Navan Road. The wheel wash station is operational during the non-freezing months of the year.

The site maintains a log to record the date and time of any fugitive dust complaints and a summary is provided in Appendix '4' – Schedule 'A'. This log also describes activities related to the investigation of the complaint, and also records the mitigative measures implemented to address concerns raised. In 2019, WCC received no complaints related to dust or dirty roads.

(f) Noise control

The active face of the landfill operation is sufficiently set back from Navan Road to minimize disturbance resulting from noise. Berms and soil stockpiles are located between active fill areas and nearby homes and offices to act as a sound barrier. Landscaped berms have been constructed along Navan Road east and west of the site access as well as east of the wheel wash station. No complaints related to noise were received in 2019. Noise monitoring was carried out by Golder Associates Ltd. and results are presented in Appendix 3. The results and site observations indicate that elevated background noise levels exist at surrounding receptors due to road traffic noise along Navan Road. Based on these results, the operations of the Navan Landfill are considered to be in compliance with the MECP's Landfill Guideline and NPC-205.

(g) Aesthetic controls

Landscaped berms have been constructed along Navan Road and a tree planting program is in place to improve site aesthetics. Each year efforts are made to further improve site aesthetics. A fish habitat ditch was completed along the east limit of the site complete with vegetation, landscaping and other ditch features. In addition to drainage, the ditch also provides an aesthetic barrier to the landfill.

(h) Fire control

Fire control is maintained by the supervision of all staff including the scale staff, the spotter and equipment operators. A number of non-smoking signs have been erected throughout the site that warns users of the danger of fire in the landfill. Personnel have been instructed on the procedures of handling a landfill fire. The use of the landfill compactor and soil as cover material does not allow a fire to persist. The excavator, compactor, loader and the dozers are available to isolate a fire. Spare cover material, available at the working face, will be used in conjunction with the landfill compactor to smother a fire. The proximity of the Ottawa Fire Department at Blackburn Hamlet (less than 5 kilometres) will allow any superficial fire to be put out in a timely manner. On-site security and the presence of employees who live adjacent to the site will allow for quick action in the event of fire after hours. All machinery is equipped with proper fire extinguishers.

(i) Odour Control (Odour Management Plan)

To ensure the WCC Navan Facility is operated in a manner that minimizes the impact from odour on the public and the natural environment, the following program is in place at the WCC Navan Facility to deal with odour issues.

(1) Odour Monitoring

WCC has a comprehensive program for monitoring odours and for taking remedial action in the event that odours become at all problematic in the operation of the WCC Navan Facility. Any unusual odour events and any measures taken to deal with odour at the site are recorded and filed on-site.

There are no Ontario Government standards for odour. There are no agreed-upon, empirical measurement protocols or odour thresholds that may be used in the operation of a landfill or processing facility. Consequently, the ultimate test of an effective odour-control strategy for any facility can only be that it produces no odour complaints from the surrounding community over an extended period of operation. The operators of the facility need to take preventative and other control measures to ensure that odours never reach a threshold where they can generate complaints. The best odour monitoring program available is to give responsibility to all staff working at the site to use their own senses to constantly monitor for excessive levels of odour on-site. While some level of on site odour is normal and acceptable, it can become a problem when these same odours register off the property. As well, the character of the odour is significant. Many 'aerobic' odours may be very inoffensive, even at a significant concentration, while even very low levels of the types of odour associated with anaerobic activity may be deeply offensive.

It is normal practice at the site to monitor odours in the following way. Every morning, when staff first arrives on the site, a general inspection is undertaken of the facility. While the site manager is looking for anything untoward, the presence of any odours likely to extend beyond the perimeter of the site will be of special concern. In addition, whenever any material at the site is being disturbed by the equipment used at the facility, staff on site periodically stand downwind of the work that is being done, and assure themselves that any odours being created are mild, indicative of fully aerobic activity, and are not likely to be carried off the property.

In the event staff on-site believe any odours may have some potential for off-site impact, they will drive to a location off-site and downwind from the work at the facility to determine at that moment if any off-site impact can be detected. If there is a detectable off-site impact, work on the site will be stopped immediately and remedial measures will be taken (see below). If no off-site impacts are detectable, work at the site will proceed with caution, with further periodic inspections off-site. Remedial measures will again be taken as appropriate.

The key to this approach is that all staff are constantly vigilant for even mild odours produced on-site and will take actions to deal with those odours well before they become evident off-site.

A windsock and flag is installed on the site. This provides a strong visual reminder to site staff of existing wind conditions, such that they can make judgments as to the potential for off-site odours, given that day's planned activities.

No odour monitoring program is of much value unless there is a companion program to control those same odours, once they are detected. What follows is a stepped program, capable of dealing effectively with everything from the mildest odours to the most offensive. It should be noted that all of the measures described below can and are just as likely to be applied to only sections of a site, rather than to the entire site. The source of odour problems can commonly be quite localized.

(2) Prevention

The best odour control strategy is odour prevention. If experienced staff early in the process makes the correct, preventative decisions, odour will not be an issue. Although mild odours are experienced on-site from time to time, they are mild in nature and should not be noticeable off-site.

A perimeter drainage system put in place by WCC has been excavated through the sand deposit into the underlying clay and extends below the water table. This drainage system has significantly reduced, if not eliminated, the potential for off-site migration of LFG.

Monitoring of methane gas at the landfill site is performed on three occasions per year generally during the spring, summer and late fall or winter. Results of the monitoring programs and interpretation of the data are presented in Section 8 of this report.

A leachate pumping station has been constructed in the southeast corner of the landfill site and a forcemain connection to the municipal sewage treatment plant commenced in 2007. Presently, the disposal method of choice for leachate generated by the WCC Navan Facility is treatment at the Robert O. Pickard Environmental Centre, a waste water treatment plant. The use of leachate retention ponds has been discontinued. This eliminates the possibility of odours emanating from on-site treatment and leachate retention ponds.

As discussed an interim LFG odour control system was installed in 2011 and commissioned in April 2012. The purpose of the interim LFG odour control system is to control potential odorous emissions from the site until the full-scale LFG collection system is installed at the site. The interim LFG odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical LFG extraction wells. The system was extended in the fall of 2016, the fall of 2017 and in 2019.

(3) Masking the Odour

Principally, these additional measures will consist of using physical, biological and/or chemical methods to mask the odours on the surface of the odour source, so that none of the odours contained within are released to the environment. A number of proven masking techniques are available and can be used at the discretion of the site manager:

- Physically covering the surface of the odour source with a 15 centimetre layer of bulking material is often enough to block the release of most odours for a period of a day or more while remedial work is done;
- A number of biological inoculants are available commercially. These substances, when applied to the surface in a water solution, are felt to effectively reinforce aggressive aerobic activity on the surface by out competing any anaerobic colonies that may be present in the near surface area. In effect, this creates a bio-filter, and biologically processes anaerobic gases as they are released; and/or
- A number of chemical/nutrient mixtures are also available commercially. These substances, when applied to the odour source in much the same manner used with the biological inoculants, can have a very similar or even stronger effect. Manufacturers of these products claim that their compounds rapidly stimulate the growth of one desirable family of microorganisms or another, again to create a bio-filter effect.

Whatever the actual mechanism, these products have been proven effective in the field. In all cases, odour control strategies used at this level can be applied within minutes of the decision to use them, and the effects will be largely felt within 10-15 minutes of that application, if not sooner.

(4) Isolating an Odour Source

The last strategy will consist of using additional measures to isolate and neutralize the offending odour source material. The offensive material may be removed from the problem area, landfilled and covered immediately. This isolation strategy will be used at the discretion of the site manager.

(j) Contingency for winter operations

The following contingency factors have been implemented in the event that very cold conditions cause operating problems:

- Snow removal equipment

A variety of equipment is available for snow removal. Two CAT 950 loaders are mainly used for this purpose. A John Deere and a CAT backhoe along with a one ton truck equipped with snow ploughing equipment are also used. A Kubota utility vehicle equipped with snow blowing equipment is available to assist with snow removal along walkways and vehicle restricted areas.

- Cover material stockpiles

Impacted soil reserved for re-use as daily cover material has been stockpiled in certain areas of the landfill. In case of frost, an excavator equipped with ripping tooth is available for ripping through the frost line. The excavator and 6-wheel drive articulated dump trucks are used to move and stockpile cover as a contingency.

(k) Complaints Procedure

In the event that an odour complaint is received, either by the City of Ottawa or the MECP, it is expected that those parties will immediately contact WCC site staff and notify them of the problem. WCC staff will take immediate steps to determine the extent of the problem and whether or not it is caused by the facility. If the source of the complaint is deemed to be originating from the WCC Navan Facility, appropriate measures as described above will be taken to mitigate the problem. Again, all such measures taken will be documented and a record kept on-site. If the identity of the complainant is made known to WCC staff, staff will contact the complainant that day, listen to their description of the problem, advise them in detail of the measures taken to rectify the problem, and invite them to visit the facility at some point to see for themselves how the site is operated. WCC will also call them back in a week's time to determine whether or not they have been aware of any other site related issues.

WCC staff has found in the past that this kind of immediate and personal attention goes a long way to building community support for a facility and builds community confidence in the management of the site.

The site maintains a log to record the date and time of any complaints. This log describes activities related to the investigation of the complaint, and the mitigative measures implemented, if required, to address concerns. A summary of complaints received in 2019 is provided as Schedule 'A' in Appendix '4'. In 2019, WCC personnel received 21 odour related complaints on 13 separate days ranging from one to multiple complaints per day of which 16 were received during the fall of 2019. No other complaints were received by site personnel in 2019.

(l) Record Keeping

Record keeping is in accordance with the requirements of the ECA and as described in the D&O (Golder, 2008) as follows:

Site inspection records and daily waste records are retained at the site for a minimum period of two years. The records include the following information:

a. Type and estimated amount of waste received at the site for landfilling and processing;
b. Area of the site in which landfilling operations are taking place;
c. Type, source and amount of daily and intermediate cover used;
d. Waste types and quantities of recyclable wastes received at the site;
e. Source of their generation (e.g. customer);
f. Waste types and quantities of recyclable wastes transferred off the site;

g. Destination of recyclable wastes transferred off the site;
h. White goods tag numbers tagged at the site;
i. Types of wastes and quantity transferred from the processing area into the landfill area;
j. The calculated total quantity (including volume or weight) of waste remaining on-site at the end of each day;
k. Records of any dust suppression activities undertaken at the site;
l. Maintenance and repairs performed on the equipment used at the site;
m. Records of complaints received and actions taken to resolve them;
n. Summary of emergency situations and actions taken to address them; and
o. Any environmental and operational problems and any mitigative actions taken.

3.2.9 Waste Acceptance and Placement

The mechanics of waste placement at the active disposal face are described as follows:

1. Procedures are in place at the site to pre-screen all special waste materials prior to arrival at the site. Generators/haulers are required to provide information related to the type of waste to be delivered at the site and complete and sign a Special Waste Profile form (SWP) which is screened prior to approval by WCC staff. Once approved, an SWP number is provided and must be presented at the scale prior to entry to the site.

2. The gate clerk registers all vehicles entering the site at the weigh scale. Vehicles are weighed and directed to the active disposal face. Light vehicles are diverted to an unloading area near the entrance to the site and do not enter the working area of the landfill. Appropriate signs are posted to indicate clearly where vehicles are to unload.

3. Vehicles reach the active face via a well-maintained gravel surfaced access road. On arrival, they wait until a ground worker screens the load and directs them to back into the active working face. The working face length is confined to as small an area as possible, but generally is wide enough so that 6 to 8 trucks can operate safely in the working face area at any one time. After dumping, the trucks move a distance of several metres from the active working face where they can be cleaned by the truck operator.

4. Waste is placed and compacted on the active working face using a "push down method" and/or a "push up method" to an average depth of approximately 60 cm.

5. A landfill D7 dozer is used to spread and level the waste as it is received. An 826 CAT compactor works on top of the refuse and compacts and shapes the waste into place. Between 3 and 5 passes with this equipment are made before the required density is obtained. Additional waste is spread evenly by repeated passes of the dozer and compactor to a total average lift depth of 2.5 to 3 metres.

6. Cover material is placed daily and as required. Generally, impacted soil hauled to the active face is used as cover material and spread into a minimum 15 cm thick layer. Areas not visited for an extended period of time are covered with a minimum of 25 cm of interim cover material.

7. All weigh tickets are kept on site along with daily and monthly summaries which are available for review. All rejected waste loads are reported to the Ministry of the Environment, Conservation and Parks (MECP) district office in Ottawa and a record of the report is kept on site.

8. Asbestos waste is landfilled in accordance with Section 17 of Ont. Reg. 347. These procedures consist of the following:

   a. Personnel involved in the disposal of asbestos are trained to recognize the related hazards.
   b. Asbestos is accepted only in containers/bags and not in a loose form. Care is taken to ensure that staff and equipment do not come into contact with the asbestos.
   c. Asbestos is accepted only with 24 hour pre-notification.
   d. Personal protective equipment including disposable coveralls, head covers and respirators are available for the handling of special wastes.
   e. Prior to the arrival of asbestos on-site, a trench is excavated to receive the material.
   f. Other operations in the immediate vicinity of the trench are temporarily suspended while the containers are emptied in the trench.
   g. The trench is immediately covered over with at least 1.25 metres of waste or cover soil.

9. Refrigerant containing appliances are received and handled in accordance with the following procedures:

   a. When refrigerant containing appliances are identified in the waste load, the client will be notified and given the opportunity to reclaim the unit(s) and remove it from the site and a rejected waste form shall be completed by scale personnel if the unit is reclaimed for removal;

   b. Should the client/driver not reclaim the refrigerant containing unit(s), scale personnel shall be notified immediately and the unit(s) shall be recorded on the weigh ticket and the unit(s) shall be removed by landfill and recycling personnel and taken to a designated area on the recycling pad taking all necessary precautions not to damage the refrigerant containing unit;

   c. Every effort shall be taken by personnel to store the refrigerant containing unit in the designated area on the recycling pad in an orderly manner that is accessible to the refrigerant removal technician and in an up-right position or, if not possible due to damage, in a manner to prevent damage to the refrigerant containing unit.

   d. Once a sufficient number of units have been stored for removal of refrigerants, or once quarterly, a certified technician shall be retained to safely remove all refrigerants and certify them as completed and a record of the certification shall be kept on file;

   e. Once the unit has been certified it shall be available for removal as scrap metal;

   f. The procedures noted above shall apply for all units received at the site that do not contain a refrigerant removal certificate, including those claimed to no longer contain refrigerant materials.

No waste is accepted, deposited or removed from the site unless the site supervisory personnel is present.

4. WASTE QUANTITIES AND CHARACTERISTICS

Major private haulers as well as small haulers serving all segments of the Ottawa community, Eastern Ontario and the Outaouais are served by the Navan Waste Recycling and Disposal Facility. Materials processed at the site in 2019 consisted mainly of contaminated soils, construction and demolition waste, IC&I waste including asbestos waste as well as general dry waste and recyclable materials. Materials received at the site for re-use included brick, rubble and small concrete as aggregate, asphalt, granular materials and clean roofing shingles for road/pad construction material.Impacted non-hazardous soils were also received for re-use as cover material or treated for re-use outside the designated air space in accordance with approvals received for the site. Materials such as metals, wood, glass, drywall, cardboard, white goods, tires and electronics were also recycled and removed from the site.

All materials received at the site are weighed upon arrival on one of two scales located at the entrance to the facility. During 2019 a total of 428,386 tonnes of waste and other materials were received at the site of which 222,976 tonnes were landfilled. The total tonnage and number of loads are summarized in Table 4.1 below.

Table 4.1: WCC Material Tonnage, Jan.1 – Dec. 31, 2019

	Tonnage	No. of Loads
Total:	428,386	53,237
Total Landfilled:	222,976	N/A
Total Reused/recycled:	205,410	N/A
Monthly Average:	35,699	4,436
Daily Average:	1,377	171.2

The above material tonnage received in 2019 includes waste landfilled, recycled waste materials, treated contaminated soils, rejected waste removed from the site and other materials received for re-use at the site.

The material distribution is as follows:

- Tonnage landfilled totalled 222,976 tonnes (52.05%) and included IC&I waste, C&D waste and other materials that were received and directed to the active working face for landfilling;
- Recyclable materials such as cardboard, tires, glass, drywall, e-waste, wood, metals and white goods taken off-site to market totalled 11,025 tonnes (2.57%);

- Waste materials rejected and removed from the site by WCC for alternative disposal at a licensed facility totalled an estimated 37 tonnes (0.01%).

- Special materials such as storm sewer screenings and impacted non-hazardous soil received at the site for re-use as cover material totalled 110,000 tonnes (25.68%).

- Impacted soils treated or re-used on site totalled 67,249 tonnes (15.70%). A total of 60,983 tonnes were hydrocarbon impacted soils treated and re-used in the east buffer and 6,266 tonnes were impacted soils re-used within the waste footprint as construction materials.

- Rock, brick, concrete, aggregate, shingles and rubble received and re-used on site as aggregate totalled 5,949 tonnes (1.39%); and

- Clean fill, topsoil and asphalt re-used on site for final grading, road/pad construction and engineered fill totalled 11,151 tonnes (2.60%).

Additional materials were recovered from cell development such as soil, concrete, boulders, stumps and metals and re-used on site or recycled. These materials however, were already on site and were not part of the inbound receipts.

All weigh tickets are kept on site along with daily and monthly summaries which are available for review. All rejected waste loads are reported to the MECP district office in Ottawa and a record of the report is kept on site. A monthly summary of material tonnage received in 2019 is provided as Schedule 'B' in Appendix '4'. The location of materials stockpiled on site is shown on Figure 4.1.

SCALE

5. SITE CAPACITY AND LIFE EXPECTANCY

The capacity of the site is a measure of the amount of compacted waste that can be incorporated into the site in a series of lifts in accordance with the approved top of waste elevation contours as shown on Figure 3.1. The total site capacity includes the total volume of daily cover material used for lift and cell construction. The estimate of air space remaining does not include the final cover materials that WCC will place once the waste pile has reached the approved fill height.

Some of the factors that continue to influence the estimated life remaining at the Navan Waste Recycling and Disposal facility are as follows:

- Volume of waste permitted by the approved top of waste elevation contours;
- Annual and daily material tonnage received at the facility for landfilling;
- Characteristics (bulk density) of the waste materials being landfilled;
- Compaction energy provided during the placing of the waste;
- Volumetric cover to waste ratio;
- The degree of cell development optimisation;
- Operational factors such as recycled waste removed from the site and the exclusion of bulky, non-compactable materials that cannot be readily incorporated into the working face;
- The re-use of waste materials received as an alternative construction material for roads and unloading pads;
- The treatment of contaminated soils;
- The volume of loose non-compactable asbestos waste received at the site and cover material required to properly dispose of asbestos waste;
- The re-location of waste from cell development on site;
- Water infiltration and rate of biodegradation of the waste; and
- Settlement/consolidation of the waste pile and underlying soft clay soils.

Factors affecting the remaining life of a site are many and varied and in fact, some will change daily. Therefore, such calculations will only provide a theoretical approximation of the expected life remaining. A factor which appears to be changing year over year is the bulk density of waste received at the landfill. Increased recycling efforts at the source with the diversion of heavy materials such as concrete, brick and rubble along with increased efforts to recycle and divert materials from landfill impact on the bulk density of the waste placed within the air space used. Other factors that affect the in-place density is the volume of impacted soils landfilled, the volume of daily cover used and the volume of impacted soils treated rather than landfilled as a waste material and the volume of bulky asbestos waste that cannot be effectively compacted following burial of this waste.

Information related to site life expectancy is important for the proper management of landfill operations. Daily records of waste landfilled or stored at the site are therefore necessary.

5.1 *Estimate of Air Space Used (ASU) - 2019*

A simplistic approach to the calculation of air space used (ASU) is based on assigning assumed in-place compacted densities to the various types of waste materials landfilled as described below:

- 2.0 tonnes/m^3 for cover soil material;
- 0.9 tonnes/m^3 for IC&I, C&D, and general waste materials;
- 0.9 tonnes/m^3 for excavated waste materials;
- 1.2 tonnes/m^3 for roofing materials
- 1.5 tonnes/m^3 Special Waste Materials (Industrial Waste, Screenings, etc.)
- 0.4 tonnes/m^3 for asbestos waste
- 0.4 tonnes/m^3 for wood waste; and
- 2.0 tonnes/m^3 for materials that are re-usable such as soil, concrete, brick and masonry.

Based on the assumed waste density distribution indicated above, the air space used by waste received, cover material and re-used materials placed within the air space during 2019 as presented in Table 5.1 is estimated at approximately 314,672.5 m^3 and excludes materials diverted off site for recycling and some materials re-used outside the air space. Based on this approach, the weighted average of the in-place density for all of the materials used in the air space calculation for 2019 is estimated to be 1.17 tonnes/m^3.

Table 5.1: ESTIMATED AIR SPACE USED (ASU), Jan.1 – Dec. 31, 2019

Material	Tonnage	Average Assumed Density, (tonnes/m^3)	Estimated Volume (m^3)
Waste Materials Landfilled	194,673	0.9	217,958.3
Special Waste Material	15,364	1.5	10,242.3
Asbestos Waste	3,694	0.4	9,235.1
Daily Cover Soils	136,254	2.0	68,127
Re-use materials (aggregates, asphalt)	14,973	2.0	7,486.3
Shingles used for sub base on road/turn areas	1,948	1.2	1,623.4
Estimated Air Space Used	366,905	1.17	314,672.5

Golder Associates Ltd. estimated the air space used by measuring the volumetric changes from topographic mapping generated from aerial photography obtained on April 30th 2019 and the previous year on May 1st 2018. The net estimated air space used (ASU) between the last two aerial survey dates was reported to be 235,639 m^3 resulting in air space remaining of 2,124,660 m^3. Records indicate that the ASU during that period of time was consumed by approximately 347,329 tonnes of waste, daily cover material and other materials resulting in a density calculation of 1.47 tonnes/m^3 for a 5 year average of 1.42 tonnes/m^3. The variance between the assumed density calculations could be attributed to many factors including optimization of cell excavation, settlement of the underlying soft clay soils and surcharge loading of the waste pile which influence the year over year volume calculations.

Active landfilling of waste materials and daily cover throughout 2019 was carried out from January to October in the area outlined as Phase 4 and from October to the end of December in the area outlined as Phase 6 (refer to Figure 2.4). Of the 188,654 tonnes of impacted soils received in 2019, a total 67,248 tonnes were treated and re-used in the east buffer or re-used on site. A total of 136,254 tonnes of impacted soils were re-used as daily and interim cover and as cover over asbestos waste in accordance with O. Reg. 347 (17), 121,406 tonnes of which was received in 2019 and 14,848 tonnes was obtained from soil stockpiled on site during previous years. Soil available on site for re-use as cover material is stockpiled and located in the southeast corner of Phase 3 as shown on Figure 4.1.

The remaining air space volume of the landfill (as of the latest Aerial Survey dated April 30th, 2019) was estimated by Golder Associates Limited to be 2,124,660 m^3. Golder Associates Limited estimated the remaining life of the landfill as of January 1st, 2020 to be 7.9 years based on the remaining air space calculated, the estimated airspace of 220,084 m^3 consumed between the last survey date and December 31st, 2019, a 5 year average density of 1.42 tonnes/m^3 and projected future annual waste receipts of 344,750 tonnes/yr.

The actual tonnage landfilled and re-used within the air space between May 1st and December 31st, 2019 was 270,056 tonnes as shown in Table 5.2 consuming an estimated volume of 227,938 m^3 based on assumed waste type densities shown yielding an estimated overall density of 1.18 tonnes/m^3 and remaining air space of 1,896,722 m^3 as of January 1st, 2020. Allowing for future waste receipts and cover soils of 344,750 tonnes/year consuming 292,161 m^3/year at a density of 1.18 tonnes/m^3, the estimated life remaining would be 6.5 years.

Table 5.2: **ESTIMATED AIR SPACE USED (ASU),** May 1 – Dec. 31, 2019

Material	Tonnage	Average Assumed Density, (tonnes/m^3)	Estimated Volume (m^3)
Waste Materials Landfilled	136,409	0.9	152,680
Special Waste Material	11,681	1.5	7,787
Asbestos Waste	2,947	0.4	7,366
Daily Cover Soils	103,079	2.0	51,540
Re-use materials (aggregates, asphalt)	14,153	2.0	7,076
Shingles used for sub base on road/turn areas	1,787	1.2	1,489
Estimated Air Space Used	270,056	1.18	227,938

As of January 1st, 2020 the life expectancy remaining for the Navan Waste Recycling and Disposal Facility under the present Environmental Compliance Approval is estimated to be 6.5 years (2026) to 7.9 years (2027) based on future projected annual waste receipts and cover soils of 344,750 tonnes/yr and a waste density varying from 1.18 to 1.42 tonnes/m^3 as discussed above. As indicated, the actual life of the landfill will vary significantly based on in-place waste densities and waste mix, but also on annual waste tonnage receipts, the amount of waste diversion and recycling initiatives at the landfill and settlement of the underlying soft clays.

5.2 *Financial Assurance*

In compliance with Condition 15 of the Environmental Compliance Approval #A460702, Financial Assurance for the site is currently in place with the MECP in the form of a Surety Bond in the amount of $13,566,246.00. Amendment Notice 11 to the ECA A460702 dated June 19th, 2018 requires that Financial Assurance be reviewed at intervals of three (3) years commencing on March 31, 2021 (Condition 15(b)); that commencing on March 31st, 2019 the owner shall prepare and maintain at the Site an updated re-evaluation of the amount of Financial Assurance required to implement the actions required under Condition 15(a) for each of the intervening years in which a re-evaluation is not required to be submitted to the Director under Condition 15(b). Such a re-evaluation was carried out by Golder Associates dated April, 2019 which concluded that the Financial Assurance already in place was adequate.

6. ENVIRONMENTAL CONTROLS

6.1 *Overview*

The key components of the environmental controls at the site are as follows:

a) Surface Water Controls:

- Ditches have been constructed to divert external flows around the landfill. These consist of north, west, and east diversion ditches, including a 237 m large diameter drainage culvert at the northwest corner of the site;
- Drainage water generated within the landfill that does not come into contact with waste is diverted to the perimeter ditches. Surface runoff water is directed from the top of the landfill down drainage chutes lined with erosion protection;
- The east diversion ditch was constructed as a fish habitat and was commissioned in late 2009 following the South Nation Conservation Authority approval;
- A pond exists in the southeast corner of the site which serves as a storm water retention pond. The north and east parts of the site drain to this pond prior to discharge to the east diversion ditch;
- A pond exists in the northwest corner of the site which serves as a storm water retention pond. The northwest and west parts of the site drain to this pond prior to discharge to the north diversion ditch.

b) Leachate Controls:

- The landfill is underlain with native low permeability clay soil (i.e. a natural liner);
- A perimeter leachate collection system has been constructed along the west and south perimeter of the waste pile;
- A leachate underdrain and collection system has been constructed below the waste in the north 1/3 of Phase 3; below the waste in the east part of Phase 8; below the waste in Phase 4; below the waste in the east half of Phase 5; below the waste in Phase 1; and below the waste in Phase 6;
- The landfill will be covered with low permeability final cover material to reduce water infiltration. Final cover has been completed in parts of the landfill as shown on Figure 3.2.

c) Landfill Gas Controls:

- Riser pipes for the leachate collection system along the north, east and west perimeters of the waste pile have been capped and the interim landfill gas odour control system consisting of a landfill gas collection and flaring system was approved by the TSSA and commissioned in April of 2012. This system has since been in operation on a continuous basis;

- The landfill gas collection system was extended to the top of Phase 3 below the final clay cover in late 2014 as well as a connection to the central MH to control odours generated from these areas. Additional horizontal gas collectors were added to this system in 2016 and 2017. In 2017, 5 vertical wells were added in the Phase 3 area and 2 vertical wells were added in the south east corner of the Phase 1 area. In 2019, 4 vertical wells were added in the Phase 4 area of the waste footprint.

- The leachate collection system and maintenance holes along the west and south waste boundaries serve as a passive venting system.

- In 2017, a misting system comprising of a 300 m perforated HDPE line and blower powered by a diesel generator was constructed on the west side of the main access road that runs along Grid Line 14 as an added odour control system.

Environmental control systems for surface water, groundwater, leachate control, and erosion control systems are discussed in greater detail in the Design & Operations Report (Golder 2008). For the purpose of this report, a summary of the systems presently in use and/or proposed is provided in the following sub-sections. Surface water, groundwater, leachate and landfill gas monitoring undertaken by Golder Associates Ltd. are discussed in Sections 7 and 8 of this report.

6.2 *Surface Water Management*

The overall objectives for surface water management at the site are as follows:

- Divert surface run-off and shallow ground water flows originating upstream of the site around the outside perimeter of the waste footprint;

- Maintain the pre-development drainage conditions and water balance to each watershed;

- Minimize the amount of surface water that comes into contact with waste (which must then be managed as leachate); and

- Maximize the removal of suspended sediment from surface water generated on site prior to its release to the downstream drainage systems.

The regional surface water setting of the landfill is discussed in Section 2.7 and existing surface water control features are shown on Figure 6.1. Existing controls can be summarized as follows:

a) Upstream flows originate from the north and northwest of the site. These flows are diverted around the landfill via ditches located along the perimeters of the site buffer zones.

b) A diversion ditch has been constructed in the north buffer of the landfill flowing east from the office/maintenance facility. A large diameter culvert was added in 2019 at the northwest corner of the waste footprint. This northern diversion ditch and culvert discharges into the east perimeter ditch. The east perimeter ditch conveys water southward into a storm water retention pond located at the southeast corner of the site. This pond discharges into an existing ditch along the landfill's south property line. The southern ditch drains under the VIA ROW near Grid Lines R-16 and flows onto WCC property and to the Mer Bleue drainage basin.

c) A diversion ditch has been constructed in the north buffer area flowing west from the office/maintenance facility. This ditch discharges into a natural drainage channel, referred to as the west perimeter ditch, flowing southward along the west perimeter of the property east of Grid Line -2. This ditch discharges at a location near the intersection of Grid Lines R and -2 and conveys flows westward to the Mud Creek drainage basin.

d) Clay cover has been placed on the north, west and south facing slopes of the waste pile as well as the top of Phase 3, the north edge of Phase 4 and the south half of Phase 1 where final waste grades have been reached as shown on Figure 3.2. Finished slopes are covered with clay soil, a thin layer of topsoil, graded and seeded. Soil stockpiles are also covered with topsoil and/or compost and seeded for surface water and erosion control.

e) Landfill operations are carried out such that surface water is directed away from the waste to minimize water infiltration.

Surface water monitoring is discussed in Section 7.

6.3 *Leachate Management*

Leachate is generated from a combination of infiltration of precipitation into the waste pile as well as surface water and groundwater discharge into the landfill despite efforts to divert water around the waste footprint. Generation of leachate is minimized by grading the waste surface and placing low permeability cover materials over areas of the landfill filled with waste to reduce infiltration from precipitation and promote surface runoff.

Leachate generated by the landfill is collected by a collection system consisting of four separate components that all drain to a leachate pumping station in the southeast corner of the site. Figure 6.2 presents the leachate collection system in plan.

1. A perimeter leachate collection system has been constructed along the southern limit of the waste footprint extending from Grid line 15 to Grid Line 1 and then approximately 330 m north along the west perimeter of the waste footprint along Grid Line 1 to just north of Grid Line K. The perimeter leachate collection system was designed with a slope varying between

0.4% and 0.6% to provide gravity drainage to a collection point at the southeast corner of the site. The waste in the north 1/3 area of Phase 3 (Northwest Cell) was placed on a drainage blanket that connects to the west perimeter leachate collection system. This system consists of a granular trench with a 250 mm diameter perforated HDPE (Boss 2000) drainage pipe. Along the southern perimeter, the leachate collection system has been constructed with lateral granular filled hydraulic connector trenches into the waste pile. Access to the western and southern leachate collection system is provided by a series of manholes spaced at approximately 100 m intervals for monitoring and maintenance purposes.

2. The north area of the site below Phase 4 was constructed with a grid-type drainage network within a stone drainage layer underlying the waste. The leachate collection system in this excavated cell consists of 200 mm diameter perforated HDPE (Boss 2000) drainage pipe surrounded by 50 mm clear stone and non-woven geotextile laid out in a grid pattern spaced no more than 45 m apart. A network of French drains, consisting of clear stone wrapped in non-woven geotextile, placed between the drainage pipes reduces the drainage path along the floor of the cell to approximately 15 m.

3. An underdrain leachate collection system has been constructed beneath the waste located between Grid Lines 14 and 16 and south of Grid Line N and just north of the pump station consisting of a stone drainage layer and perforated drainage piping similar to the system constructed in the Phase 4 area to the north. A clay berm was constructed along Grid Line N to separate the two leachate collection systems located on each side of Grid Line N.

4. A fourth component to the leachate collection system consists of the east lateral expansion cell (Phases 1 and 6) designed by Golder Associates Ltd. and approved by the MECP as an amendment to the ECA No. A460702 Notice 1 dated October 9th 2009. This system in Phase 1 was completed in 2015 with Phase 6 completed in 2019. QA/QC was carried out by Golder Associates Ltd. and as-built reports were prepared by Golder Associates for each of the completed cells and submitted to the MECP. A leachate sump and pump is located at the northwest corner of Phase 1 to drain leachate from both the Phase 1 and Phase 6 areas.

Presently, the disposal method of choice for leachate generated by the WCC Facility is pre-treatment using air stripping followed by direct discharge to the City sewer system via a WCC forcemain. The leachate pumping station located at the southeast corner of the landfill site and leachate forcemain connection to the municipal sewer system on Renaud Road were completed in 2007 and commissioned in early 2008. Pre-treatment of leachate to reduce the concentration of H_2S and Volatile Organic Carbons (VOCs) is carried out prior to pumping leachate to the municipal system. In 2008, cleanouts were added along the leachate forcemain to provide easier access for cleaning and maintenance. In 2011, the leachate pre-treatment and pumping station was expanded with the addition of higher capacity treatment chambers and higher capacity pumps to maintain discharge flows at the approved 17L/sec. The forcemain discharging to the City of Ottawa sewer system was pressure washed on two separate occasions in 2019 to clean the line and maintain unobstructed flows.

In 2019, a total of 148,817 m^3 of pre-treated leachate was discharged to the City of Ottawa wastewater system, a 46.1 % increase over 2018. The increase is attributed to increased precipitation in 2019 and collection of leachate from the new cell in Phase 1. The monthly leachate volumes discharged are

summarized in Table 6.1. The monthly and cumulative volumes of leachate pumped are shown graphically on Figures 6.3 and 6.4 respectively. The peak month was April with a volume of 24,424m^3. The daily average for the period of operation was 407.7 m^3.

Table 6.1: Summary of Leachate Volumes Discharged Off-Site in 2019

Month	Leachate Volumes (m^3) Discharged to City Sewer	Cumulative Leachate Volumes (m^3)
January	4,594	4,594
February	5,400	9,994
March	18,491	28,485
April	24,424	52,909
May	20,475	73,384
June	12,572	85,956
July	14,648	100,604
August	10,220	110,824
September	5,726	116,550
October	4,852	121,402
November	12,466	133,868
December	14,949	148,817
Total:	148,817	

Leachate monitoring is discussed in Section 7.

6.4 *Landfill Gas Management*

Landfill gas generation at the site is limited although its presence can be identified in the waste pile area by signs of dying vegetation and/or localized snow melt during the winter. Landfill gas is produced when organic waste decomposes. It consists primarily of methane (50%) and carbon dioxide (50%) as well as water vapour, nitrogen, and trace amounts of other non-methane organic compounds (NMOC). Non-putrescible waste received at the landfill does not generate landfill gas and methane at the same rate as municipal solid waste (MSW). Methane, which is explosive at concentrations greater than 5%, presents a health and safety risk both on-site and off-site. As a result, monitoring of landfill gas is carried out at the property boundary and within facilities located on site. In addition, passive gas ventilation systems and an active gas collection system at the site prevent the off-site migration of landfill gas.

The perimeter leachate collection system extends below the water table and prevents off-site migration of gas. Figure 6.2 provides details of the perimeter leachate collection system along the southern limit of the landfill.

As part of a commitment to control potential odorous emissions from the site, WCC has installed an interim landfill gas odour control system which will operate until the full-scale landfill gas collection system is installed at the site. This interim odour control system, constructed within the existing landfill footprint, includes connections to leachate collection cleanouts, existing vertical landfill gas extraction wells, and to horizontal wells. This system also includes the installation of lateral and header piping, condensate management facilities, an outdoor skid-mounted abstraction plant, and a candlestick flare. During construction, leachate collection system cleanouts were excavated and the perforated pipe replaced with solid pipe and air tight connections. Tees were installed in the header pipe to allow for expansion of the system as required.

The interim landfill gas odour control system was installed in 2011 and commissioned in April of 2012. Additions to the LFG collection system which included horizontal and vertical wells were constructed in the fall of 2016, in late 2017 and in 2019. In 2019 the LFG system operated for 8,059 hrs at an average of 368 scfm with a methane (CH4) concentration of approximately 48.8%, yielding a total of 2,653,399 m^3 of methane which was flared using the landfill gas flaring system. A 6.8% decrease in methane recovery was recorded from 2018 to 2019.

A monitoring program associated with the odour control system has also been implemented. Design of the full-scale landfill gas collection and flaring system has been completed by Golder Associates Ltd.

Landfill Gas monitoring is discussed in Section 8.

6.5 *Buffer Zone*

The perimeter of the site is surrounded by a buffer zone which occupies an area of about 6.2 ha. In accordance with the ECA, a minimum buffer width of 30 m is maintained between the northern, eastern and western limits of the landfill area and the property boundary. A minimum buffer width of 10 m is maintained between the southern limit of the landfill area and a VIA Right-of-Way. WCC owns additional lands to the north, west and east of the landfill site as well as a 100m wide track of land south of the VIA ROW providing additional buffer space. No waste is deposited within the designated buffer zone. The limits of waste are illustrated in plan on Figure 2.4.

7. WATER QUALITY MONITORING

Water quality monitoring undertaken to date at the Navan Waste Recycling and Disposal Facility consists of water quality analysis of surface water, groundwater, leachate and sediment. The location of water monitoring stations is shown on Figure 7.1. In 2019, Golder Associates Ltd. (GAL) was retained to carry out the annual water quality monitoring program and reporting requirements for the Navan Waste Recycling and Disposal Facility and prepare a report to fulfill the reporting requirements outlined in Conditions 135 and 136 of the Environmental Compliance Approval (ECA) No. A460702. The 2019 GAL report is attached in Appendix 1 and summarized below.

The following summary highlights key points only; for complete information and findings it is necessary for the reader to examine the GAL report provided in Appendix 1.

The monitoring program undertaken was a continuation of the monitoring program already in place for this site and followed the program outlined in Conditions 109 and 112 of the ECA and Condition 10.1 of the Conditions of Environmental Assessment Approval. As per Condition 109, the monitoring program includes sampling of the monitoring wells located in BH09-1 in order to assess the groundwater quality in the Mer Bleue Bog. The original monitoring program indicated that the wells would be sampled during the winter, when the Mer Bleue Bog is frozen and the wells are accessible. However, the groundwater in the monitoring wells has frequently been frozen during these events. In the 2013 monitoring report (Golder, 2014), it was proposed to sample them during the summer, rather than the winter, in 2014 and future years. Due to dry conditions in the summer groundwater samples were successfully collected at monitoring wells BH09-1B, BH09-1C and BH09-1D during the fall session on November 21, 2019 (monitoring well BH09-1A was frozen at the time of sampling, therefore no sample was obtained).

Groundwater monitoring sessions in 2019 were carried out by GAL on June 19 and November 20-21, and surface water monitoring sessions were carried out by GAL on June 20, August 28 and November 21. Leachate quality analysis was undertaken on samples obtained by GAL from the pump station (L5) on June 20, August 28 and November 21. The following is a summary of the results of the monitoring sessions undertaken in 2019 presented in the GAL report provided in Appendix '1'. Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected in November 2018 and will therefore be sampled again in the spring of 2020 and no samples were obtained from these monitoring wells in 2019.

In addition, sediment quality is also monitored at three locations within the Mer Bleue Bog. This program was initiated in 2000 at the request of the National Capital Commission (NCC). In 2019, sediment samples were obtained by GAL on June 20, August 28 and November 21.

A Monitoring and Screening Checklist prepared and signed by a Competent Environmental Practitioner (CEP) is included with the Golder 2019 Landfill Monitoring Report attached as Appendix '1'.

The objectives of the 2019 environmental monitoring program were:

- To comply with the annual monitoring and reporting requirements stipulated in Conditions 109, 112, 135 and 136 of Environmental Compliance Approval No. A460702;
- To assess any potential impacts on water quality at the site resulting from landfill operations;
- To continue the monitoring of water quality for key parameters at target locations up-gradient and down-gradient from the landfill;
- To document the chemical composition of groundwater and surface water in the vicinity of the landfill;
- To assess site compliance with site specific trigger levels relating to groundwater impacts due to leachate; and
- To document the chemical composition of sediment at three locations in the Mer Bleue Bog.

7.1 *Groundwater Quality Assessment*

Based on the groundwater levels obtained during the 2019 monitoring program, no significant change in groundwater flow patterns have been observed.

Groundwater at the WCC Navan Facility is monitored within four stratigraphic units identified as a shallow surface sand layer, an upper weathered clay zone, an intact (un-weathered) deposit of clay and a glacial till/upper bedrock zone. Monitoring wells are present up-gradient, at the down-gradient edge (used to assess compliance) and further down-gradient of the landfill in each of these units.

The hydrogeology of the site indicates a recharge area north of the landfill having a downward groundwater flow component. South of the site, the hydrogeology indicates a discharge area having a slight upward groundwater flow component. In general, shallow groundwater quality is variable, but a distinction is noted between groundwater quality up-gradient and down-gradient of the landfill in the weathered clay. Groundwater in the intact clay deposit up-gradient of the landfill is also slightly different from down-gradient groundwater quality. In the glacial till/ upper bedrock groundwater zone, only minor differences exist in the groundwater quality across the site.

The Ministry of the Environment, Conservation and Parks (MECP) has stated that the Reasonable Use Guideline is not applicable at this site. A compliance assessment of groundwater quality was completed using the accepted groundwater and surface water trigger mechanism (Golder, 2007b). The Leachate Indicator Parameters at all groundwater monitoring locations immediately down-gradient from the landfill which are used to assess compliance were graphed and visually checked for exceedances of the 1998 to 2019 background range.

Trigger concentrations exceedances were reported in 2018. As a result, in accordance with ECA Condition 123 (a), WCC informed the MECP Ottawa District Office of these exceedances in a phone call on March 6, 2019. WCC presented a proposed course of action to address these exceedances and implemented it in 2019, in a continuing effort to achieve a drained state in the leachate collection system.

In 2019, only one trigger exceedance of the background range was reported: it was for magnesium at MW92-10, in the weathered clay stratigraphic unit. No other continued increase in concentration for other parameters beyond the background range was reported in 2019 in the sand stratigraphic unit or the weathered clay stratigraphic unit, due to stabilizing or decreasing concentrations following WCC actions.

In a continuing effort to achieve a drained state in the leachate collection system, WCC intends to proactively maintain the forcemain in good working condition and acquired a spare leachate pump to reduce down time when a pump requires servicing. Discharge pumps were already upgraded in the fall of 2011 from 20 horsepower to 35 horsepower in an effort to achieve and maintain a discharge of 17 litres per second. Treatment modifications were commissioned in 2012, increasing pumping capability, which resulted in the ability to maintain the leachate collection system in as much a drained state as possible and to better manage the peak discharge periods. A similar course of action is proposed to be followed in 2020.

Results from the upcoming spring 2020 monitoring session will be analyzed to determine if the effect of these actions are detected in groundwater quality with a decrease in concentrations of Leachate Indicator Parameters at trigger locations, including in the intact clay and glacial till/upper bedrock units. At that point, the need for a formal contingency plan will be assessed in collaboration with the MECP.

7.2 *Leachate Water Quality Assessment*

Landfill leachate is water that comes into contact with waste and leaches soluble material from the waste. Its composition is a function of the solid waste characteristics, prevailing meteorology, hydrogeology and parameters within the landfill such as pH, moisture content, degree of compaction, geometry, etc. Leachate is wastewater that dynamically alters not only with landfill age but also with changes in seasons and waste characteristics. The intrinsic biodegradability of municipal landfill leachate can be measured by a BOD:COD ratio. During the first several years of production, the BOD:COD ratio generally is in the 0.5 range. As the landfill ages, the ratio decreases to levels less than 0.1 suggesting a more or less biologically recalcitrant organic composition (Andreottola et al., 1989). Also, the concentration of ammonia tends to increase with landfill age since ammonia is a by-product of the stabilization of organic matter (Elefiniotis et al., 1989), although at a dry waste facility such as the WCC Facility, ammonia concentrations can be expected to remain relatively low.

Leachate quality monitoring results for 2019 indicate that leachate generated at the WCC Navan Facility is not significantly different from previous monitoring events. Leachate at the WCC Navan Facility continues to be relatively weak wastewater when compared to municipal landfill leachate.

Monitoring of treated leachate is also carried out on a more frequent basis in compliance with the City of Ottawa discharge requirements at the WPCP (ROPEC).

7.3 *Surface Water Quality Assessment*

The WCC Navan Facility is located on a watershed divide resulting in drainage of surface water to both the east and west of the site. The east side of the site drains to the Bear Brook or Mer Bleue drainage basin and the west side into the Mud Creek drainage basin which drains into Green's Creek. The Mer Bleue Bog is located immediately south of the site. Surface water samples are collected in the drainage course to the east, the west and in the perimeter of the Mer Bleue Bog. Surface water data at the WCC Navan Facility is variable over time and the Mer Bleue Bog surface water quality is poor. The WCC Navan Facility is an engineered landfill site; therefore, an excursion of leachate would be apparent in the underlying stratigraphic units prior to a surface water impact. As such, a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. A site-specific groundwater based trigger mechanism is the appropriate approach for the WCC Navan Facility.

Surface water quality monitoring will continue at the site, with the samples analyzed for appropriate parameters of concern and evaluated for potential impacts. This approach was outlined in the approved Groundwater and Surface Water Trigger Mechanism report (Golder, 2007a). The MECP has agreed that this is the preferred approach for the WCC Navan Facility.

7.4 *Sediment Quality Assessment*

Sediment samples were collected at three locations within the Mer Bleue Bog as per an agreement with the National Capital Commission (NCC). In general, parameter concentrations measured in the sediment were similar to previously reported concentrations.

Results are compared to the MECP Table 1 sediment criteria, and Table 2 and Table 4 Recreation/Parkland soil criteria (MOE, 2011) and the CCME freshwater sediment and Recreation/ Parkland soil criteria (CCME, 1999). Given that the material sampled is peat found in the saline Mer Bleue Bog environment, it could be debated that sediment criteria for freshwater deposits should not be used.

The peat deposit in the Mer Bleue Bog predates any human activity in the area. Having filtered hundreds of years of surface runoff water into the perimeter portion of the bog, it should not be surprising to find contaminants in this natural sink.

In 2002/2003, an assessment of the WCC Navan Facility operations was undertaken in support of a WCC-NCC (WSI-NCC) exchange of land parcels located south of the WCC Navan Facility along the northern margin of the Mer Bleue. The assessment concluded that the landfill site had not caused impacts to soil, sediment, groundwater or surface water quality within the Mer Bleue. These findings were accepted by the NCC.

7.5 Proposed 2019 Monitoring Program

The proposed 2020 Environmental Monitoring Program is the same as was conducted in 2019, with the exception of VOCs which are proposed to be removed from the groundwater monitoring program (see Golder Report Section 9.0 in Appendix 1). As per Condition 109 of the ECA No. A460702, the monitoring wells located in borehole 09-1 will be sampled once per year to assess the groundwater quality in the Mer Bleue. However, due to the on going inability to collect water samples because of the frozen conditions necessary to access the wells in the winter, efforts will be made to collect a sample during a dry period (i.e., in the summer) as has been done between 2014 and 2018 (due to dry conditions in the summer of 2019, they were sampled in the fall where possible).

As explained in Section 7.3, the MECP agreed that an excursion of landfill leachate would be apparent in the underlying stratigraphic units prior to a surface water impact and a surface water trigger mechanism would not be an effective component for the site trigger for the purpose of effectively protecting the off-site surface water/bog water regime. Therefore, Golder has proposed to discontinue sediment monitoring and rely on the groundwater and surface water monitoring programs to assess off-site leachate impacts. With MECP concurrence, sediment monitoring could resume temporarily if leachate impacts and trigger exceedances are reported at the site.

Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected during the November 2018 monitoring session and will be monitored again in the spring of 2020.

8. LANDFILL GAS (LFG)

Golder Associates Ltd. (GAL) was retained to carry out the landfill gas monitoring program in 2019. The monitoring program undertaken was a continuation of the monitoring program already in place for this site and the results of the monitoring events undertaken are summarized below and presented in more details in the GAL report provided in Appendix '2'.

8.1 *LFG Monitoring Results*

The report has been prepared to fulfill the reporting requirements outlined in Condition 110 of Environmental Compliance Approval No. A460702 dated April 16th, 2009.

LFG monitoring was carried out on June 12th 2019, on August 29th 2019 and on December 17th 2019. At most locations monitored, methane gas was less than 5 percent (%) of the Lower Explosive Limit (LEL). Non-methane organic compounds (NMOCs) do not present an emissions problem at this site. As expected, LFG is present within the leachate collection system that also serves as a passive ventilation system, with methane concentrations measured in excess of 25% LEL (or 1.25% by volume for the spring session) at the following locations (refer to Fig 2, Appendix "2"):

- Monitoring well OW-92-8 (G15) in December 2019.
- MH-10 (G-2a) in August and December 2019.
- MH-9 (G-3a), MH-7 (G-5a), MH-6 (G6-a), MH-4 (G12-a), MH-3 (G13-a) and the tank truck loading station MH (G84-a) in December 2019.

It is noted that no location during the spring 2019 monitoring session reported a methane concentration in excess of 25% LEL, nor in excess of 1.25% by volume.

Monitoring of ambient air conditions in close proximity to point sources of LFG indicate normal atmospheric conditions with trace or non-detectable levels of LFG. According to *Ontario Regulation 232/98*, the Landfill Standards, the design of a landfill must ensure that the subsurface migration of LFG meets several conditions including:

- The concentration of methane gas below the surface of the land at the boundary of the site must be less than 2.5 percent by volume; and,
- The concentration of methane gas must be less than 1.0 percent by volume in any on-site building or enclosed structure.

The on-site building requirements were met by the Navan Facility based on the 2019 monitoring results.

The Navan Facility is designed with a buffer area and natural barriers. The site has a favourable hydrogeological setting whereby the site is underlain and surrounded by a thick clay deposit of low

permeability. The depth below grade to the water table at the perimeter of the site is shallow. The depth of the landfill between the ground surface and the water table is less than 2.5 metres. It is generally considered that methane gas migration of any significance may extend for a distance of ten times the depth of the landfill between the ground surface and the water table. Based on site conditions, this 10:1 general rule would suggest that methane migration could extend for a distance of 25 metres. The north, west, south and east sides of the landfill footprint are surrounded by buffer zones of 30 to 70 metres, 100 metres, 10 metres and 140 metres, respectively. Note that on the south side of the landfill a 10-metre buffer zone exists between the south limits of the waste mound and the VIA Rail right-of-way (ROW) and an additional buffer strip with a width of 100 metres exists to the south of the VIA Rail ROW. These buffers would therefore provide adequate natural venting. The natural barriers and the provision of adequate buffer area present at the Navan Facility are the preferred method of dealing with potential LFG migration. Although no monitoring locations are available below surface at the property boundary, based on the presence of a buffer area and natural barrier system, it is anticipated that the Navan Facility met the property boundary requirements in 2019.

Hydrogen sulfide was not detected at any location during the 2019 monitoring events with the exception of the following locations, which reported relatively low detections:

- Monitoring Wells OW-94-2 (G-8), 05-R3 (G-9) and MH-4 (G-12a) in June 2019
- Collector MH (G-26i) in August 2019

During the 2019 monitoring events, no odours were detected by Golder technician at the WCC Navan Facility during the spring and summer monitoring sessions. During the 2019 winter monitoring session, moderate, but not offensive odours were noted at the site. Strong odours were specifically noted at gas extraction well GW-1. Historically, odours have been detected in some areas (near the active face); however, they were transient and dissipated at a short distance from the source. As previously mentioned, gas monitors installed in three on-site buildings including the scale house have not been triggered to date. The site maintains a log to record the date and time of any odour complaints. This log describes activities related to the investigation of the complaint, and the mitigative measures implemented, if required, to address concerns. In 2019, WCC personnel responded to twenty-one odour related complaints. The Public Advisory Committee subsequently mailed out four thousand notices to inform stakeholders of a public meeting organized by the Committee. A total of twelve people attended the public meeting and none of the people in attendance had submitted a complaint.

It is noted that an interim LFG odour control system (refer to Section 6.4) was installed in 2011 and commissioned in April 2012. An extension to the LFG odour control system was installed in the fall of 2016 and again in late 2017 and in 2019. The additional vertical wells installed in 2017 and in 2019 are intended to be part of the future permanent LFG collection system. The purpose of this system is to control potential odorous emissions from the site until the full-scale LFG collection system is installed at the site. The interim LFG odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical LFG extraction wells (refer to Fig. 8.1).

8.2 *2018 Regulatory Reporting (NPRI, O.Reg. 127/01, O.Reg. 347, O.Reg 452/09 and Federal GHG)*

In 2019, Dillon Consulting Limited (Dillon) was retained by Waste Connections of Canada Inc. (WCC) to complete the following for the WCC Navan Facility:

- An assessment to determine the reporting requirements under the *National Pollutant Release Inventory* (NPRI) for the 2018 calendar year;
- An assessment to determine the reporting requirements under *Ontario Regulation 127/01 – Airborne Contaminant Discharge Monitoring and Reporting* (O.Reg. 127/01) for the 2018 calendar year;
- Greenhouse Gas Reduction Reporting as required under *Ontario Regulation 347*;
- An assessment to determine the reporting requirements under *Ontario Regulation 452/09 – Greenhouse Gas Emissions Reporting* (O.Reg. 452/09) and the Federal Government Greenhouse Gas Reporting Program for the 2018 calendar year; and
- Assist with data input and submission for Environment Canada's online Single Window Information Manager (SWIM) module, if required.

The Navan Landfill reported to the NPRI in 2019 under NPRI identification number 10967 and has not been required to report to the Federal GHG or Ontario GHG programs in the past. Site operations are identified by NAICS code number 562210 "Waste Treatment and Disposal".

Dillon conducted an assessment of facility operations and material usage in order to determine which substances must be reported to each of the programs mentioned above for the year 2018.

Based on Dillon's assessment, the Navan Landfill was required to report to NPRI in 2019 for the year 2018. The total annual on-site releases and off-site transfers of the reportable NPRI Part 1, Part 2, and Part 3 substances are summarized in Table I. Annual air releases for the NPRI Part 4 and Part 5 substances are also provided in Table I.

Table 8.1: 2018 NPRI Reporting

NPRI Substance	On-site Releases (tonnes)			Off-site Transfers (tonnes)	
	Air	Land	Water	Disposal	Recycle
Part 1 Substances					
Asbestos	-	-	-	211.8 (on-site)	-
Mercury				25.1 kg	
Part 2 Substances					
None	-	-	-	-	-
Part 3 Substances					
None	-	-	-	-	-
Part 4 Substances					
CO	74.19				
PM_{10}	3.487	-	-	-	-
$PM_{2.5}$	1.867	-	-	-	-
Part 5 Substances					
None	-	-	-	-	-

The reports were made based on estimates and not measured values. Many of the parameters that are reportable are the result of handling high volumes of materials on site which are above the manufactured, processed or otherwise used reporting threshold, e.g. leachate and asbestos, but do not result in airborne emissions from the facility. The reporting of mercury was triggered by shipments of contaminated soils received at the site for disposal that contained elevated levels of mercury. The reporting of the emissions of particulate matter (PM10) was triggered by fugitive dust emissions from roads and is generally also reported by all industrial operations in Ontario due to very low thresholds.

Ontario Regulation 347 requires landfill sites larger than 1.5 million cubic meters to report annually on the greenhouse gas reductions being achieved at the site. The Navan Landfill meets the regulation requirements and submitted the required Landfill Data Collection Form electronically for 2018 to the Ministry of the Environment, Conservation and Parks.

It is noted that an interim landfill gas odour control system (refer to Section 6.4) was installed in 2011 and commissioned in April 2012. The purpose of this system is to control potential odorous emissions from the site until the full-scale landfill gas collection system is installed. The interim landfill gas odour control system includes connections to the existing leachate collection system cleanouts and to existing vertical landfill gas extraction wells as shown on Figure 8.1.

Based on this assessment, the Navan Landfill does not meet the reporting requirements for O.Reg. 127/01, or the Ontario GHG reporting programs and was therefore not required to report in 2019 for the 2018 calendar year but was required to report the direct greenhouse gas emissions for this facility for the period identified to Environment and Climate Change Canada (ECCC).

The total GHG emissions for the facility in 2018 were reported as follows:

	Emissions (t)	Emissions (t CO2e)
Carbon Dioxide (CO2)	1248.172	1248.172
Methane (CH4)	1029.635129	25740.878225
Nitrous Oxide (N2O)	0.053829	16.041042
Hydrofluorocarbons (HFCs)		
Perfluorocarbons (PFCs)		
Sulphur hexafluoride (SF6)		
Facility Total reported to Environment and Climate Change Canada:		27005.091267
Carbon dioxide (CO2) from biomass combustion:		9342.706

Release Estimate Comparison: 2017 vs. 2018

Table 8.2 provides a comparison between 2017 and 2018 releases for reportable substances. Reasons for changes in release quantities for the two reporting years are provided for those substances/contaminants shown with a ±10% change in release quantity.

Table 8.2 – 2017 vs. 2018 Release Values

Substance	2017 Reported Value	2018 Reported Value	% Change	Reason/Comments
Asbestos	Air = 0 tonnes Disposal = 230.3 tonnes Recycle = 0 tonnes	Air = 0 tonnes Disposal = 211.8 tonnes Recycle = 0 tonnes	(-) 8%	No significant changes in disposal on-site
Mercury	Did not trigger reporting	Air = 0 tonnes Disposal = 25,01 kg Recycle = 0 tonnes	N/A	Shipments of contaminated soils received at the site contained elevated levels of mercury
CO	Air = 73.48 tonnes	Air = 74.19 tonnes	(+) 1%	No significant change in air releases
PM10	Air = 3.540 tonnes	Air = 3.487 tonnes	(-) 1%	No significant change in air releases
PM2.5	Air = 1.856 tonnes	Air = 1.867 tonnes	(+) 1%	No significant change in air releases
CO2e(Federal)	Air = 11,004 tonnes	Air = 27,005 tonnes	>(+)100%	Revised k & Lo resulted in increased GHG emissions from waste decomposition

9. PROCESSING/RECYCLING

9.1 *Diversion of Waste and Other Materials from Disposal*

Diversion through the reuse and recycling of resources is a key activity in the on-going management and preservation of disposal capacity at the WCC Navan Waste Recycling and Disposal Facility. For example, all daily and intermediate cover needs are met by substitution of virgin soils with the re-use of significant quantities of impacted soils. Brick, concrete, asphalt and rubble are also recovered for re-use each year in the construction of access roads and container storage pads. Roofing shingles free of paper and other debris are also re-used on site as a sub-base for roads and pads over which is placed a layer of aggregate or recycled asphalt. In addition, steel, aluminum, wood and white goods are recovered daily from the active face of the landfill and recycled. The site also currently assists local landscape and tree removal contractors by receiving wood waste that is put through a grinding process and sent to markets off site for use as bio-mass or bulking agent for organic composting. Other waste materials removed from the site for recycling include cardboard, tires, glass, drywall and E-waste.

Materials received by the Navan Waste Recycling and Disposal Facility are those which IC&I generators have generally deemed to be waste and of no further value (i.e., post diversion at the source). Many of the waste generators serviced by waste collection contractors who bring waste to the site also divert materials from the landfill at their place of business prior to collection. Recycling within the IC&I sector is regulated by the Ministry of the Environment, Conservation and Parks under Regulations 101, 103 and 104. While the site receives post-diversion waste materials from the IC&I sector, WCC has procedures in place to screen the incoming waste for recyclable material in what is known as a "last chance harvest" which is a "positive" sort where the recyclable item must be removed from the mixed waste mass. In this case, the majority of the material is not recyclable (i.e., it is waste). This is very different than recycling from "source separated" material, which results in a "negative" sort, where the waste components are removed from what is predominantly recyclable material. WCC also encourages and receives "clean" recyclable materials such as wood, metals, drywall, glass and E-waste. Such materials are shipped to market in bulk in efforts to make the recycling of these materials more economically viable.

Management at the WCC Navan Waste Recycling and Disposal Facility is constantly searching for on-site and off-site diversion opportunities to ensure that approved disposal capacity is preserved and used for the disposal of waste material of least commercial value. Given the provincial policy and regulations concerning waste diversion from landfill, the WCC Facility will continue to support the City and the Province in their efforts to meet diversion targets while at the same time ensuring essential disposal capacity is available locally.

Approval for the treatment of contaminated soils was received from the MECP in June of 2015. The treatment of hydrocarbon contaminated soils was started soon after in the processing area of the site located within the waste footprint (refer to Figure 2.4). Treated soils are re-used on site as final cover material or as structural fill along the waste line within the east buffer. Soils which had not reached the treatment criteria by the end of 2019 remained on the treatment pad until the treatment objectives could be achieved or landfilled as waste.

The amount of waste diversion achieved from "last chance harvest" at the WCC Navan Waste Recycling and Disposal Facility over the past five years is summarized in Table 9.1.

Table 9.1: Diversion at Navan Waste Recycling and Disposal Facility (2015 - 2019)

Material	2015	2016	2017	2018	2019	5-Year Total
Off-Site recycling:						
Materials removed for off-Site recycling	10,867	13,164	10,249	14,712	11,025	60,017
On-Site reuse:						
Aggregate material re-used (rubble; brick; concrete; rock)	13,707	22,651	8,480	11,935	5,949	62,722
Asphalt, clean fill, clean shingles	15,303	13,877	7,262	5,623	11,151	53,216
Treated/re-used soils	40,310	61,048	31,096	31,726	67,249	231,429
Total Diversion (excluding daily cover soils)	**80,187**	**110,740**	**57,087**	**63,996**	**93,374**	**407,384**
Waste to Landfill	234,477	233,867	171,419	233,994	222,976	1,096,733
WCC Recycling and Disposal Facility "last chance harvest" diversion rate (excluding daily cover soils)	**25.5%**	**32.1%**	**25.0%**	**21.5%**	**29.5%**	**27.1%**

NOTE: All quantities are in tonnes

At the Navan Waste Recycling and Disposal Facility, loads of clean rubble, rock, asphalt, clean shingles or concrete that are received for disposal from a construction job site are set aside for re-use in the construction of on-site roads and pads. From 2015 to 2019, approximately 115,938 tonnes of these materials were diverted from disposal, avoiding the use of a more valuable resource such as quarried stone.

Heavy equipment equipped with a large magnet and grappling attachments are used for the recovery of metals from the waste after it is dumped at the landfill. Five people are hired full-time to focus on recycling opportunities and are assisted by landfill personnel. All refrigerant containing appliances have the refrigerant removed by a licensed technician prior to recycling. Metals collected on site are stockpiled and removed in bulk by a local contractor using tractor trailers. Smaller loads of more valued metals such as copper, aluminum and brass are shipped regularly to local scrap metal recyclers such as American Iron and Metal (AIM). In response to market interests in recycled wood products, wood is recovered from waste at the site and a wood grinder is used to reduce the wood to a chip size that is suitable to an end market and then removed in bulk using tractor trailers. Wood chips are shipped off-site to local mills where they are re-used in the production of wood pellets or used directly as an alternate fuel source. Wood chips are also used as a bulking agent at organic composting sites. Glass is also collected and removed in bulk from the site for recycling. From 2015 to 2019, over 60,017 tonnes of materials have been shipped off site for recycling and diverted from disposal at the site.

As indicated in Table 9.1, the Navan Waste Recycling and Disposal Facility diverted over 93,374 tonnes of material from disposal in 2019, and over 407,384 tonnes during the past 5 years. For 2019, this represents a "last chance harvest" diversion rate of 29.50% and excludes the re-use of impacted soils for daily cover material. This is in addition to the 17%-18% diversion rate for IC&I waste that occurs at the source. WCC will continue to improve waste diversion and recycling initiatives at the Navan Facility and pursue economically viable waste diversion opportunities to help the local community and WCC clients achieve a better IC&I recycling rate.

9.2 *Recycling*

For years, an independent contractor has undertaken processing (recycling) of steel and wood at the active face of the landfill. In 2009, the use of heavy equipment and permanent staff were introduced to improve health and safety as well as productivity. Daily records of materials received for processing and materials recycled and/or reused are maintained on site. In 2019, there were no operational problems reported related to the processing (recycling) facility.

A total of 11,025 tonnes of waste materials consisting of aluminium, wood, glass, drywall, e-waste, white goods, tires and ferrous metals were recycled and removed from the site in 2019. At the end of the year some materials remained stockpiled for removal in bulk at a later date such as white goods and metals. Wood waste also remained stockpiled in the material recycling area for further size reduction with the use of a wood grinder prior to shipment to off-site markets.

Brick, aggregate, rock and rubble received at the site and re-used in 2019 as aggregate for road construction totalled 5,949 tonnes. Clean fill, clean shingles and asphalt re-used on site as final grading, road/pad construction and engineered fill totalled 11,151 tonnes.

Drywall material received at the site free of debris was stored in a designated area for recycling and when sufficient volumes were received, drywall was processed through a grinder and re-used in powder form as a soil amendment.

Glass received at the site free of debris was stored in a designated area and when a sufficient volume was received, the glass was shipped in bulk to a recycling facility in Montreal, Quebec or Guelph, Ontario. In 2019, a total of 3,121 tonnes of glass were shipped off site for recycling.

Treatment of hydrocarbon contaminated soils was started at the site in 2015 following the receipt of MECP approval. Treated soils were re-used on site as final cover material and as structural fill along the waste limit within the east buffer. Soils which had not reached the treatment criteria by the end of 2019 remained on the treatment pad until the treatment objectives could be achieved or landfilled as waste. In 2019, 60,983 tonnes of hydrocarbon impacted soils were treated at the recycling facility for re-use in the east buffer and 6,266 tonnes of impacted soils were re-used within the landfill footprint as construction materials.

10. PROPOSED 2020 OPERATIONS

10.1 *Landfill Development*

10.1.1 Phasing of Remaining Operations

In 2020, WCC will continue to develop the landfill in a manner consistent with their past operating practices and proceed with capital projects required for the site operations as presented in the revised D&O (Golder, 2008). Over the past number of years, landfilling has progressed in a counter-clockwise pattern starting in the northwest corner of the site (area indicated as north half of Phase 3 on Figure 10.1). To date waste has been placed over the entire permitted waste footprint of the landfill as shown on Figure 10.1 with Phases 2 and 3 having been completed. In areas where significant settlement has occurred, re-grading will be carried out. In 2020, landfilling will continue in the last completed cell identified as Phase 6. Closure work will continue at the top of Phase 4 and in parts of Phase 5 and a small area in Phase 1 where final waste grades have been reached.

The landfill development strategy for the remaining operating period is presented on Figures 10.1 A & B and 10.2 and described in more detail in Section 10.1.2.

10.1.2 Development Schedule

The schedule for developing the remaining landfill capacity is driven by the on-going rate of waste receipts for disposal, the need for readily available constructed landfill air space and rate of cell development which, given the sensitive nature of the clay soil to be excavated, placed and compacted, is influenced by weather conditions. Under the revised ECA (April 2009), the life expectancy remaining for the WCC Landfill as of January 1st, 2019 is estimated to be 6.5 years (2026) to 7.9 years (2027) based on future projected annual waste receipts of 344,750 tonnes/yr and a waste density varying from 1.18 to 1.42 tonnes/m^3 (refer to Chapter 5). The actual life of the landfill will vary based on the actual annual fill rate, waste densities achieved, waste diversion and recycling initiatives at the landfill and the rate of air space development.

Other site operations will evolve together with the on-going landfilling operation as follows:

a) Landscaping

- Apply topsoil and provide additional landscaping to completed final cover areas on the south and southeast slopes of Phase 1 as well as planting additional trees in previously completed areas. This will include removing trees previously planted in the Phase 6 area and re-planting them in other areas of the landfill that have been completed.

b) Final Cover Construction

- Complete filling to final grade in Phase 4 and northwest area of Phase 5. Complete final cover construction in completed areas of fill.

c) Surface Water Management

- Re-align surface runoff away from fill areas and cell construction areas.
- Raise grades in the east buffer adjacent to the waste footprint and grade to direct surface runoff away from waste.
- Place cover clay in areas where waste fill final elevations have been reached to direct surface runoff water to collection swales and ditches.

d) Recycling Operations

- "Last Chance Harvest" of recyclable waste will continue in the active face using specialized heavy equipment as per present practice.
- Increase efforts to sort and divert waste from small vehicles at the small vehicle drop-off area and provide incentives to clients to sort materials at source prior to arrival at the site.
- Establish markets for new recyclable materials in efforts to increase the types of materials to be recycled at the site.
- Enhance/research treatment of contaminated soil.
- Construct a working pad in the area of Phase 4 for recycling activities.

e) Landfill Gas Flaring System

- Where required, add additional wells (horizontal and/or vertical) to the landfill gas collection system to control fugitive gas in fill areas and enhance the odour control system.
- Proceed with the acquisition of the permanent abstraction and flaring plant.
- Obtain TSSA approval of the detail engineering design for the permanent flaring system designed by Golder Associates Ltd.

f) East Cell Construction (Phase 6)

- Complete construction of the north and northeast cell slopes in Phase 6 to accommodate additional lifts of waste.
- Construct a clay barrier wall over the culvert at the north and northeast edge of the waste footprint in Phase 6.

10.1.3 Soil Management

The development of the remaining landfill capacity in the area of Phase 6 (east cell expansion) requires filling and compacting approximately 15,300 m^3 of material including side slopes as of the last aerial photo (April 30th, 2019). Soil management practices will include the following:

- Excavation of clay from the Phase 5 area will occur in the second and third quarters of 2020;
- Sediment control measures will be taken so that inactive areas such as soil stockpile side slopes are seeded; silt fences are installed as required around the perimeter of disturbed areas; and surface runoff from the stockpile areas will be channeled to the internal ditch system which will drain to the site's stormwater retention ponds.

10.2 *Proposed Surface Water Control Improvements*

The current surface water management system is described in the "Design and Operations Report - Navan Landfill Site Expansion Approvals" (Golder 2008). The surface water management system operates at the site to maintain the pre-landfill drainage conditions to each watershed; to divert surface water and shallow groundwater flows originating upstream of the site around the landfill; to minimize the amount of surface water that comes into contact with waste; and to maximize the removal of suspended sediment from surface water generated prior to it's release to the downstream watersheds. Water that comes into contact with waste is collected and managed as leachate. For the revision and updating of the D&O plan, the existing surface water system was assessed in regards to the storm flows that can be transmitted and these flows were compared to the requirements of the Landfill Standards. Improvements were proposed where the existing system was deficient relative to the Standards. Further modifications have been proposed in support of the EPA/OWRA application for the landfill expansion. As a result of these assessments, WCC has proceeded with changes to the surface water management system at the site in order to improve the overall system. The proposed changes to the drainage system are described as follows:

- The east diversion ditch has been deemed a fish habitat and its construction included various features to promote and support fish habitat. This work was completed and continues to be maintained.
- A stormwater management pond was constructed in the southeast corner of the site and a ditch discharging surface runoff water to the pond was constructed along the east access road connecting the pond to the north drainage ditch. Ditch and pond maintenance is on-going. In 2019, construction of a HDPE drainage culvert in the existing ditch alignment along the north and northwest edge of the cell was completed. Construction of the clay cut-off wall above the culvert will occur in 2020.
- A stormwater management pond located in the northwest corner of the site was constructed in 2012 to manage runoff water from the west side of the site. Landscaping consisting of the planting of shrubs and trees in this area is on-going. Drainage chutes in the northwest and southwest corners of Phase 3 were constructed in 2015 to control surface runoff water from the

completed surface of Phase 3 and Phase 4. As the access road at the top of Phase 3 and Phase 4 continue to be extended, swales to promote drainage and seeding will also be carried out;

- Efforts will be made on a continuing basis to maximize the diversion of surface runoff from the active working face in order to reduce leachate generation. This will involve the redirection of internal ditching on an as-needed basis to direct runoff water from capped and stabilized areas to the perimeter ditch system.

10.3 *Leachate Management*

All leachate collected in the existing leachate collection system is designed to drain to a collection well and pump station located at the southeast corner of the existing waste footprint near Grids Q & 16. A forcemain connection allowing treated leachate to be pumped directly to the municipal sewage system for conveyance to the city sewage treatment plant has been constructed and an agreement is in place with the City of Ottawa to discharge pre-treated leachate to the City sewer system. The forcemain was commissioned in early 2008 and has since been used successfully. The use of the forcemain to discharge leachate from the site to the City of Ottawa sewer system is anticipated to continue throughout 2020.

Approved modifications to the pre-treatment/pumping system were completed in 2011. These improvements were initiated in advance of the east expansion cell construction to improve the treatment efficiency and capacity of the system and to increase the pump station flow rates as well as reduce maintenance. The system improvements were commissioned in early 2012 and will continue operations throughout 2020. One additional 35 HP pump was purchased in 2019 as backup to the existing pumps to minimize downtime during servicing. No other alterations or modifications are anticipated in 2020.

The "Navan Landfill Leachate Collection and Maintenance System Lateral Expansion Area – Quality Assurance/Quality Control Plan and Specifications" prepared by Golder Associates was submitted and approved by the MECP in 2009. Excavation and construction of the east expansion cell, Phase 1, was completed in 2015 with Phase 6 completed in 2019 and included the construction of the drainage layer and leachate drainage features and the east cell pumping system. This system will continue to be in full operation in 2020 discharging collected leachate from this cell to the leachate treatment system. Completing the upper north and northeast clay slopes of the cell in Phase 6 will occur in 2020.

A vertical manhole, connected to the leachate collection system in the centre of the existing waste footprint (referred to as "the central manhole"), provides an alternative point of access to evacuate leachate from this part of the leachate collection system in the event that the positive drainage to the wet well and pump station cannot be maintained due to sub-grade settlement. This manhole has been raised to an elevation of 101 metres and will require that it be raised with additional MH sections in 2020.

10.4 *Surface Water, Groundwater and Leachate Monitoring*

The proposed 2020 Environmental Monitoring Program is the same as was conducted in 2019, with the exception of VOCs which are proposed to be removed from the list of parameters of the groundwater monitoring program. In groundwater samples, VOCs were detected at times in groundwater monitoring wells located immediately downstream of the waste footprint, with most occurrences of VOC detections happening in 2007 and 2008 in wells MW05-11 and MW05-8 when spikes were also experienced in other leachate indicator parameter concentrations. Even then, the VOC concentrations were well below the ODWQS with no recorded exceedance of ODWQS in downgradient wells with the exception of benzene concentrations at MW05-11 more than 10 years ago (in November 2007, May 2008 and November 2008) and MW05-8 (November 2008, December 2008 and May 2009). Some VOCs (relatively low concentrations or one or more of benzene, toluene or ethylbenzene) are sometimes detected in leachate samples (location L5) with some exceedances slightly above the ODWQS. It is proposed to continue monitoring VOCs in leachate and monitoring for VOCs in downgradient monitoring wells could be resumed if an increase in VOCs in leachate is observed.

As per Condition 109 of the ECA No. A460702, the monitoring wells located in borehole 09-1 will be sampled once per year to assess the groundwater quality in the Mer Bleue. However, due to the on-going inability to collect water samples because of the frozen conditions necessary to access the wells in the winter, efforts will be made to collect a sample during a dry period (i.e., in the summer) as it was done since 2014.

Note that, as per the approved monitoring program, sampling of monitoring wells screened in the intact clay and the glacial till/upper bedrock is planned to occur on an 18-month schedule. Groundwater samples from these units were collected during November 2018 monitoring session and will be monitored again in the spring of 2020.

The objectives of the 2020 environmental monitoring program are:

- to comply with the annual monitoring and reporting requirements stipulated in Conditions 109, 112, 135 and 136 of ECA No. A460702
- to assess any potential impacts on water quality at the site resulting from landfill operations
- to continue the monitoring of water quality for key parameters at target locations up-gradient and down-gradient from the landfill
- to document the chemical composition of groundwater and surface water in the vicinity of the landfill
- to assess site compliance with site specific trigger levels relating to groundwater impacts due to leachate
- to document the chemical composition of sediment in the Mer Bleue Bog

10.5 *Landfill Gas Management*

Construction of an approved landfill gas collection and flaring system to serve as an interim odour control system was completed in 2011. Commissioning of this system was carried out in April 2012. This system captures landfill gas from the existing leachate collection system below the active fill areas of Phases 1, 2, 4 and 5. Vertical wells installed in Phases 1, 3 and 5 along with horizontal wells installed below the final clay cap in Phase 3, the west end of Phases 4 and 5 and in Phase 1 assist with odour control at the site. Expansion of the interim landfill gas system with the construction of four additional wells in the east end of Phase 4 was completed in 2019. In 2020, an odour control misting system will be constructed on the west side of the landfill to mitigate odours from the site.

The landfill gas monitoring program undertaken by Golder Associates in 2019 will be continued in 2020. Monitoring of landfill gas is carried out three times per year at the property boundary and within facilities located on the site. Monitoring of the odour control and flaring system will also be part of this program.

Assessment of air emissions will again be undertaken for the landfill site in accordance with MECP Reg.127/01 and NPRI reporting requirements.

10.6 *Recycling and Small Vehicle Unloading Facility*

Recycling will continue at the WCC Landfill site in 2020. Heavy equipment equipped with a large magnet and grappler is used for the removal of metal and wood from waste received at the active face of the landfill. A small vehicle unloading pad consisting of a raised paved surface with concrete retaining walls has been constructed at the front of the site east of the new site entrance to serve as an area for small vehicles to unload and sort materials. Concrete bunkers for the receipt of small loads of recyclable materials such as clean fill, asphalt, aggregates, and roofing shingles were added just south of the scale house with access from the small vehicle pad to the east. This small vehicle unloading area improves safety at the site by eliminating the need for small vehicles to access the active face. The facility is grade separated such that bins for various types of wastes and recyclables are easily accessible (i.e., with the top of the bins at or near the ground surface in the drop off area). A utility road has been included to provide access to collect or drop off roll-off containers. Small vehicles are required to be weighed on the scales when entering and exiting the site.

Another recycling area is located within the waste footprint along the southern edge of the area identified as Phase 8. This area is used for the storage of processed materials for later removal in bulk and shipment to local markets. White goods containing refrigerants are also stored in this area for refrigerant removal by an on-site technician. Recycling activities in this area consist of tires, drywall, glass, clean shingles, metals and wood. In 2020, it is proposed to construct a pad in the completed Phase 4 area for the grinding of wood, storing of metal and other recyclable materials.

E-waste recycling services are also offered for the benefit of the local community.

The treatment of contaminated soil as part of the recycling initiatives at the site was approved by the MECP in 2015. Contaminated soils will be treated to a level sufficient for an alternative use on-site and/or off-site. The treatment of impacted soils will continue throughout 2020.

These recycling activities will continue throughout 2020 as will efforts to expand on recycling services and finding new markets for recycled materials.

10.7 *Office and Maintenance Facility*

No capital site improvement projects other than adding an odour control misting system on the west side, landscaping and minor site improvements are anticipated for 2020. Landscaping efforts will continue on the north, west, south and southeast facing slopes where cover construction has been completed. Preserving existing vegetation by transplanting trees to the east and north sides of the landfill in addition to adding new trees and shrubs will also continue.

Information presented in this report was provided by Waste Connections of Canada Inc. (WCC) Navan Waste Recycling and Disposal Facility personnel.

This report was prepared for WCC by:

Normand G. Castonguay, M.A.Sc., P. Eng.

Schedule 'A'

Complaints Summary

Schedule 'A'
2019 COMPLAINTS SUMMARY

No.	Event Date	Event	Response
		Odours	
1	13/01/2019	1 complaint Received an e-mail complaint from a neighbor (AM) about odours @ 11:45 pm	Just got home. Strong smell on all of Wintergreen Drive. Stood outside for 10 mins, odour was consistent, gets stronger as you walk towards landfill. Winds calm, -18 °C, HH with WCC called and visited the complainant the following morning and left him his cell phone number to call at any time. No odours noticed at time of visit.
2	15/05/2019	1 complaint Received an e-mail complaint from a neighbor (VT) about odours @ 7:00 am	Odeur nauséabonde, plus qu'a l'habitude, environ un 7 sur 10 au niveau odeur. Winds from SE, 8 km/hr, 12 °C, HH with WCC stopped by and spoke with the complainant. She mentioned the odour was strong this morning but for the most part no issue. The smell was detected as soon as she opened the door.
3	18/06/2019	1 complaint Received an e-mail complaint from a neighbor (AM) about odours @ 8:45 pm	Absolute horrid smell from landfill on Winterhaven Drive for the last two hours. Backyard and front yard. Had to close all windows upstairs. We have 3 kids. Winds from E, calm km/hr, 8 °C, overcast HH with WCC visited the residence at 4:25 am, no odours with winds still from the east. Spoke with one neighbor who was indoors that evening but did not smell anything that afternoon or evening. Spoke with another neighbor who was out walking his dog the previous evening and did not notice any landfill odours. He has called about odours in the past but lately it has been very good.
4	4/07/2019	1 complaint Received a complaint from a neighbor (CT) about odours @ 6 – 10 pm	Landfill odour 6 – 9 pm Winds from SE/S, 6-8 km/hr, 27 °C, sunny/overcast HH with WCC responded at 10:05 pm and found no odours. Spoke with a neighbor who indicated there were no odours on July 4th and that it has been good the last 1 ½ years. Spoke with another neighbor who indicated there were no odours on July 4th and mentioned sometimes on a hot muggy day there is a slight odour.
5	18/07/2019	1 complaint Received an e-mail complaint from a neighbor (AM) about odours @ 8:20 pm	Strong smell from landfill on Winterhaven Drive for the last 15 minutes. Had to close patio doors and windows. Winds from SE/S, 5 km/hr, 24 °C, rain HH with WCC drove the area at 10:25 pm and following morning and did not notice odours. Spoke with a neighbor who has lived on Winterhaven since 2014 and he has not had any odour issues.. HH responded by e-mail.

6	20/9/2019	1 complaint Received a text complaint from a neighbor (CT) about odours @ 8:11 am	Stinks again this morning – worse. Winds noted from the SW, from the direction of the complainant. JC with WCC responded immediately and visited the area and spoke with the resident and a few other neighbours. Odours usually in early morning. Complainant noticed it more in back yard. House is located adjacent to a storm water discharge ditch which drains a storm water pond to the west. HH drove around area and noticed a slight odour. Spoke with a neighbor who did not have any issues but mentioned that just sometimes she smells odours but not very often.
7	25/9/2019	1 complaint Received an e-mail complaint from a neighbor (TR) about odours @ 1 pm	It been about a week now in the morning and late evening the smell is so bad we cannot open the windows of the house. RM with WCC responded by e-mail.
8	25/9/2019	1 complaint Received an e-mail complaint from a neighbor (KP) about odours @ am	Smell is very strong on Shinleaf. RM with WCC responded by e-mail.
9	25/9/2019	1 complaint Received an e-mail complaint from a neighbor (KL) about odours @ 9:30 am	Odour from the dump. Can't even open windows. RM with WCC responded by e-mail.
10	25/9/2019	1 complaint Received an e-mail complaint from a neighbor (EW) about odours @ 8:00 am	Very strong smell of garbage noted by visitors and all members of household. RM with WCC responded by e-mail
11	25/9/2019	1 complaint Received an e-mail complaint from a neighbor (NP) about odours @ 7:00 am	Very strong odour that I've come to recognize comes from the dump. Winds reported to be from S 6 km/hr, temp 8 °C, overcast HH drove to the location and in the surrounding area around 7:05 pm with same wind direction, no distinct odour found.
12	25/9/2019	1 complaint Received an e-mail complaint from a neighbor (AR) about odours @ 7:00 am	Odor from the dump. RM with WCC responded by e-mail.

13	27/9/2019	1 complaint Received an e-mail complaint from a neighbor (KC) about odours @ 10:00 pm	Could not keep window open smell was awful. HH visited the complainant on the morning of Sept. 28th and responded by e-mail.
14	25/10/2019	1 complaint Received an e-mail complaint from a neighbor (PD) about odours @ 3:00 pm onward	Strong dump smell Request for contact by a WCC representative declined. Winds reported to be from E 12 km/hr, temp 8 °C, sunny HH visited the area on Oct 27th with same wind conditions and did not notice any odours. HH responded with e-mail.
15	27/10/2019	1 complaint Received an e-mail complaint from a neighbor (CL) about odours all day	Terrible odour throughout the area, and all day Winds reported to be from E/SE 20 km/hr, temp 7 °C, HH visited the area that evening at about 8 pm, wind s from the S, no odours. HH responded with e-mail.
16	31/10/2019	1 complaint Received an e-mail complaint from a neighbor (JM) about odours @ 7:00 am	Arounf 7:00 am while going to work, I noticed a bad smell when I stepped out of the door coming from the landfill on Navan Road. Request for contact by a WCC representative declined. Winds reported to be from E 13 km/hr, temp 8 °C, overcast HH drove the neighborhood around 10:30 am, with E winds and noticed no odours.
17	4/11/2019	1 complaint Received an e-mail complaint from a neighbor (DB) about odours @ 8:00 am	and yet again the whole neighborhood smells like a DUMP. Everubody has been complaining for the past few years, and nothing is being done, at least nothing that solves the problem. You ask that they keep filing complaints, but for what? We've been living in the neighborhood for 4 years … it's such a shame. Request for contact by a WCC representative declined. Winds reported to be from SE 7 km/hr, temp -2 °C, rain
18	4/11/2019	1 complaint Received an e-mail complaint from a neighbor (AS) about odours @ 5:40 pm	Request for contact by a WCC representative declined. Winds reported to be from SE 16 km/hr, temp 5 °C, overcast
19	4/11/2019	1 complaint Received an e-mail complaint from a neighbor (JC) about odours @ 7:15 pm	A sewage smell as been noted in the area and it has been frequent. Request for contact by a WCC representative declined. Winds reported to be from SE 7 km/hr, temp -2 °C.
20	4/11/2019	1 complaint Received an e-mail complaint from a neighbor (MO) about odours @ 6:00 pm	Strong odour in the air. Smells from the Waste Connection site have been reaching my property since the spring. I'm disappointed and disgusted. The smell seems to intensify in humid conditions or on day with little wind. Requested contact by a WCC representative. Followed up by e-mail by RM with WCC. Winds reported to be from SE 16 km/hr, temp 4 °C, rain

21	17/11/2019	1 complaint Received an e-mail complaint from a neighbor (LC) about odours @ 11:00 am	Request for contact by a WCC representative declined. R M from WCC drove around the atra at about 4 pm and no odours detected at that time.
	30/10/2019	FOMB Public Meeting	The purpose of the meeting held at le Rendez-vous des ainés francophone d'Ottawa was to hear about any issues and concerns local residents may have regarding the operation and impact of the landfill so that they are being properly understood and effectively communicated The desired outcome was to see if there were any on-going issues affecting a large area of the community that could be addressed. Flyers were sent to over 4,000 homes. Approximately 8 families or 12 people attended. It did not appear that any of those who previously complained attended. A summary of the meeting is attached.

FOMB Public Meeting
October 30, 2019
Rendez-vous des ainés francophone d'Ottawa
3349 Navan Road, Orleans

Purpose of the public meeting

The FOMB Board welcomed participants and reviewed the purpose of meeting: to hear about any issues and concerns local residents may have regarding the operation and impact of the landfill so that they are being properly understood and effectively communicated.

The desired outcome was to see if there were any ongoing issues affecting a large area of the community that could be addressed.

Public meeting invitations and attendance

Flyers advising people of the meeting were distributed to just over 4,000 homes in the K1W postal code area which covers Bradley Estates, Chapel Hill South and Trails Edge.

Personal invitations were also sent to the e-mail addresses of all those who previously complained via our web site.

Approximately 8 families or 12 people attended the meeting. It doesn't appear that any of those who previously complained attended.

Meeting introduction

The meeting began at 7:00pm with an outlining of the history of the FOMB, some of its past and current activities, and the FOMB's relationship with Waste Connections Canada. This was followed with a presentation of the following information:

Relevant statistics presented at the meeting:
Since 2017 we have received a total of 121 complaints through the FOMB website

- 86 or 71 % of all complaints in 2017
- 20 or 16.53 % of all complaints in 2018
- 15 or 12.4% of all complaints in 2019 (to Oct 28)

Of this total, there were a number of multiple complaints from the same household, but one individual stood out. That person was responsible for 31 or 25.62% of complaints as follows:

- 21 or 24.4% in 2017
- 7 or 35% in 2018
- 3 or 20% in 2019

The majority of the complaints originated in 2017 during the months of November and December with some flowing into Jan 2018. There appears to be a decreasing amount of complaints, at least through the FOMB website.

The majority of the complaints (98.35%) came from the Trails Edge and Bradley Estates areas.

Meeting Discussion

It was emphasized that the FOMB and the community were fortunate to have a conscientious landfill operator willing to communicate and, wherever possible, minimize its impact on the neighborhood. It was pointed out that WCC is an operating landfill and, as well run and managed as any landfill might be, there could be odours and other issues from time to time.

People wishing to talk about attempting to close the landfill were advised that this was not an option. They were informed that the landfill will continue to operate until its current approved capacity is reached, which is estimated to be in 8 to 10 years, at which time it will be closed and caped.

Some meeting attendants said they have noticed occasional odours, but none said there was a daily ongoing issue.

There were two suggestions/observations made at the meeting

1. There is apparently a lot of garbage along the walking trail at the back of the landfill, especially in the spring. A suggestion was to have WCC clean this up as most of the items appear to come from the landfill site.

2. A suggestion about WCC installing a clearly visible sign, perhaps in the Navan/ Blackburn bypass area, providing directions to the landfill. This would serve to warn prospective buyers about the existence of a landfill since the builders apparently do not, as may also be the case for real estate agents. However, concern was expressed that doing so could negatively impact the future sale of homes for current owners.

Conclusions

It is possible that the decreasing number of complaints might be due to people not knowing about the FOMB website. However, our experience indicates residents come to meetings and otherwise participate when there is a serious community problem.

Based on the relatively small attendance or other feedback as a result of the public meeting invitation, it appears residents living in the targeted area and those who previously complained do not presently seem to have major issues with the landfill.

The meeting concluded at 8:00 pm

Schedule 'B'

2019 Tonnage Summary

SCHEDULE "B"

Month	Total Inbound Monthly Tonnage	2019 Outbound and Re-Used Monthly Tonnage													Total Outbound and Re-Used Monthly Tonnage	Total Tonnage Landfilled

Schedule 'C'

Brief Site History

Schedule 'C'
BRIEF SITE HISTORY

Landfilling at the Site started in the early 1960s and served, at the time, as a rural dump operation for local residents. In 1971, the Ministry of Environment and Climate Change (MOECC), formerly the MOE, issued a Provisional Certificate of Approval (CofA No. 460702) to Mr. D. J. Huneault for disposal of industrial waste including construction and demolition waste. Currently the site receives all types of solid, non-hazardous waste for disposal excluding putrescible waste. In 1995, the CofA was amended for the operation of waste processing and composting facilities at the site. Composting operations were suspended with the issuance of the CofA amendments in April 2009. In 2016, the CofA, now an Environmental Compliance Approval (ECA) was amended to permit the treatment of contaminated soils.

Annual monitoring of groundwater and surface water was initiated in 1987 and has evolved into a comprehensive monitoring program that is reported to the MOECC on an annual basis. In 1992, a leachate collection system was constructed along the down-gradient toe of the landfill and surface water diversion ditches were constructed up-gradient within the north buffer zone. Leachate was initially collected in retention ponds and re-circulated onto and into the landfill following treatment through a peat filter and constructed wetland system. Transport of leachate by tanker truck to the municipal wastewater treatment plant was initiated in 1997 and used for 11 years. Construction of the existing leachate pre-treatment/pumping station and forcemain connection to the City of Ottawa sanitary sewer system was completed in 2007 and commissioned in early 2008.

In 2001, a landfill gas collection and flaring system was constructed as an interim odour control system. This system was commissioned in April of 2012 and has remained operational since then.

Construction for the last landfill cell was completed in 2019.

A detailed record of milestones in the site's history is presented as follows:

1960s The site was established to serve the local resident population, operating as a rural dump operation.

1971 The first Ministry of Environment (MOE) Provisional Certificate of Approval (CofA No. A460702) was issued to D.J. Huneault and revised in 1980.

1981 Detailed inspections, surveys and water samplings were undertaken. Monitoring wells were installed. Ownership of the site was transferred to Huneault Waste Management (474299 Ontario Ltd.). An application was submitted to update the CofA.

1983 The CofA was re-issued to 474299 Ontario Ltd. for a 100-acre landfill site limited to construction rubble and inert materials.

1984 Following an Ontario Municipal Board hearing, the site was re-zoned to permit landfilling.

1987 An annual monitoring program for groundwater and surface water was initiated.

1989 Four groundwater-monitoring stations were installed along the south property boundary.

1991 A land use agreement was entered into between the City of Gloucester (now City of Ottawa) and 474299 Ontario Ltd. Monitoring of surface water, groundwater and leachate was increased from annual to semi-annual monitoring events.

1992 A leachate collection system was constructed along the down-gradient toe of the landfill. Surface water diversion ditches were constructed up gradient within the north buffer zone. A leachate retention pond was constructed in the southeast corner of the landfill area. The first of two large cells was excavated in the northwest quadrant.

1993 A second leachate retention pond was constructed in the southeast corner of the landfill area. The CofA was re-issued. Waste types were limited to construction and demolition debris, asbestos; non-hazardous solid industrial waste including impacted soil. The second of two large cells was excavated in the northwest quadrant.

1994 The company changed its name from 474299 Ontario Ltd. to Huneault Waste Management Ltd.

1995 Landfilling continued in the west half of the landfill. Landfill gas monitoring was carried out and passive ventilation trenches were constructed. A large peat filter for leachate treatment was constructed east of the leachate retention ponds. The CofA was amended to permit the processing (recycling) and composting of waste materials (leaf and yard waste).

1996 The CofA was amended to allow for the receipt and composting of wet waste. Constructed wetlands were used for on-site treatment of leachate. A compost pad was constructed within the landfill area with recycled asphalt. In the fall, composting of leaf and yard waste as well as composting of mixed organics began.

1997 Due to complaints from neighbouring residents related to odour issues at the Site during the spring and summer, the use of leachate retention ponds and the composting of wet waste were suspended. Leachate was trucked by tanker to the municipal wastewater treatment plant (ROPEC) in compliance with a field order issued by the MOE. Updates to the 1994 Water Management Systems Report were submitted to the MOE for approval and included a design for a long-term leachate pumping station.

1998 Leachate continued to be trucked by tanker to the municipal wastewater treatment plant (ROPEC). The CofA was amended to insure the company submit a revised compost management plan for approval by the MOE prior to receiving mixed organics at the composting site.

1999 In July of 1999, ownership of the landfill changed. Leachate continued to be trucked by tanker to the municipal wastewater treatment plant (ROPEC). The 1994 Water Management Systems Report (1998 Revisions – Leachate Management) and the Huneault Landfill Leachate/Effluent Pumping Station Design prepared by Totten Sims Hubicki Associates Ltd., both dated December 1998, were approved by the MOE and the CofA was amended.

2000 Leachate continued to be trucked by tanker to the City of Ottawa wastewater treatment plant (ROPEC). Construction of a new leachate wet well and pump station was completed. The leachate loading station was relocated to the top of the waste pile near Grid Line P-13 following the construction of the pump station. In September 2000 the corporation changed its name from Huneault Waste Management Ltd. to Waste Services Inc. (WSI).

2001 Leachate continued to be trucked by tanker to the City of Ottawa wastewater treatment plant (ROPEC). A second scale house was added at the entrance to the site to better serve WSI clients and to improve inbound and outbound traffic control. Active landfilling was being carried out in the southeast quadrant of the Site.

2002 Waste Services Inc. (WSI) was acquired by Capital Environmental Services Inc. (CERI), a publicly traded company. An amendment to the CofA was approved to allow foundry sand, wood chips and contaminated soil to be used as alternative daily cover, to allow recycled asphalt and inert granular materials to be used as road base, and to increase the service area to include the Province of Ontario. A CofA (Air) No. 6141-XKF9 was approved to permit the use of a tub grinder on site. A new scale and scale house were constructed at the entrance to the landfill to ease traffic congestion on Navan Road. Leachate continued to be trucked by tanker to the City of Ottawa wastewater treatment plant (ROPEC). Active landfilling was being carried out in the southeast quadrant of the Site.

2003 Leachate continued to be trucked by tanker to the City of Ottawa wastewater treatment plant (ROPEC). Ainley Graham and Associates, a municipal engineering firm, completed a preliminary design for a leachate forcemain connection to the City of Ottawa sanitary sewer system. A small parcel of land referred to as the Larivière property and running the length of the Site's east property line was acquired in late 2003.

2004 Leachate continued to be trucked by tanker to the City of Ottawa wastewater treatment plant (ROPEC). A land exchange agreement was completed with the National Capital Commission giving WSI ownership of a 6.91 hectare parcel of land being a 100 metre strip south of the VIA right of way (ROW) in exchange for an 8.43 hectare parcel south of land owned by WSI (Plan 4R-19707) bringing its total land mass in and around the landfill Site to 69.05 hectares.

2005 Leachate continued to be trucked by tanker to ROPEC. A compliance order was received from the City of Ottawa to pre-treat the leachate and reduce the concentrations of hydrogen sulphide discharged at the wastewater treatment plant. The engineering firm Ainley Graham and Associates completed a Stage 1 Detailed Design for the Leachate Pre-Treatment/Pump Station and Forcemain with connection to the City of Ottawa sanitary sewer system. A small parcel of land referred to as the Robert property, running along the landfill Site's east property line, and a residential property located at 3516 Navan Road were acquired. Golder Associates Ltd. was retained to undertake geotechnical and slope stability analysis for the Site as well as monitoring for landfill gas, groundwater, surface water, leachate and sediment. Golder was also retained to undertake a leachate pre-treatment study. In November, WSI announced to the public that it was undertaking a project to expand the capacity of the landfill and extend its operational life by at least 10 years beyond 2011. The first public Open House was held on December 8, 2005.

2006 In May 2006 the MOE issued an amended CofA No. A460702 consolidating previous Certificates of Approval and associated notices and updating the CofA to the current standards. An updated Design and Operations Report prepared by Gartner Lee Ltd. was adopted. Also in May, a proposed Terms of Reference for the expansion of the landfill in accordance with the Environmental Assessment Act was submitted to the MOE and these were approved in October 2006. Leachate continued to be trucked by tanker to ROPEC. Chemical treatment of leachate to reduce H_2S concentrations began in the spring. An approval for the Leachate Pre-Treatment/Pumping Station and another to install a leachate forcemain within the Navan and Renaud Road allowances were obtained from city council with construction commencing in early December. Additional property to the east of the landfill located at 3326, 3548, 3560 and 3578 Navan Road were acquired by WSI bringing its total land mass in and around the landfill site to 90 ha.

2007 WSI considered and used the results of an environmental assessment (EA) to identify a preferred landfill expansion alternative for the Site thereby extending its operational life. The expansion of the WSI Navan Waste Recycling and Disposal Facility received approval under the Ontario Environmental Assessment Act (EAA) on August 3, 2007. Construction of the leachate forcemain and associated site modifications were completed in August. At the request of the City of Ottawa, modifications to the leachate pre-treatment and sampling system were undertaken with design and construction completed during the later part of 2007.

2008 A revised D&O Report was prepared by Golder Associates Ltd. (January, 2008) to meet the regulatory requirements described in the Landfill Standards (MOE, 1998) and the associated Ontario Regulation 232/98 to address the related Conditions of Approval for the proposed landfill expansion under the EAA. The proposed expansion of the Navan Waste Recycling and Disposal Facility required approval under the Ontario *Environmental Protection Act* (EPA) as well as other legislation. In early 2008, WSI presented submissions to the MOE to satisfy both the conditions of the approved EA and the requirements of the EPA and OWRA. Commissioning of the leachate pre-treatment/pump station was completed in February with leachate being pumped via forcemain to the City of Ottawa sewer system. Construction of new weigh scales, scale house and access roads began in the fall.

2009 Expansion of the Navan Landfill under the Ontario Environmental Protection Act (EPA) received approval with the issuance of the revised CofA No. A460702 (Waste Disposal Site) on April 16, 2009 along with CofA No. 4816-7C7M6C (Industrial Sewage Works) and CofA No. 6733-7BYS9A (Air). CofA No. A460702 was subsequently amended by Notice 1 on October 9th 2009. Significant facility improvements were completed at the entrance to the Site consisting of new scales and scale house, new Site entrance, new office/maintenance facilities, a new small vehicle unloading area and a new wheel wash station. An east diversion ditch c/w fish habitat features was constructed along the east edge of the property and commissioned in the fall following South Nation Conservation Authority approval. A 963 m^2 segment of property bordering Navan Road and west of the new site entrance was severed and transferred to the City of Ottawa for the future widening of Navan Road. Leachate continued to be pre-treated and discharged via forcemain to the City of Ottawa sewer system.

2010 In July, Waste Services Inc (WSI) merged with BFI Canada Inc., a Progressive Waste Solutions company, to become the third largest provider of waste services in North America. This merger had no impacts on the operations of the Navan Waste Recycling and Disposal Facility. Facility improvements continued to be made throughout 2010 and included completing the pavement structure for the main entrance and access to the site, the small vehicle unloading area and office/maintenance facility parking area and fire route. Berm construction and landscaping east of the wheel wash station and west of the site entrance were also completed. The design for modifications to the leachate pre-treatment/pumping station was approved by the MOE and the Certificate of Approval (Industrial Sewage Works) was amended (CofA # 5616-86NKNW). The design for an interim odour control system at the site was approved by the MOE and the Certificate of Approval (Air) was amended (CofA # 3536-8APNZD). Construction of the landfill gas forcemain and flaring system was started in November. Cell development continued in the Phase 2 area of the site with active landfilling being carried out in Phases 3 and 4.

2011 Construction of the landfill gas forcemain and flaring system was completed and awaiting approval by the Technical Standards and Safety Authority (TSSA). Construction of the leachate pre-treatment and pumping station improvements were completed. Monitoring well MW11-1 was installed to replace monitoring well OW92-8. E-waste recycling services were introduced for the benefit of the local community. The east stormwater management pond was completed in the fall. Cell development was completed in the area of Phase 2. Landfill was carried out in Phases 2, 3, and 4.

2012 An interim odour control system comprising of a landfill gas collection and flaring system was commissioned and approval by the Technical Standards and Safety Authority (TSSA) was received in April. The west stormwater management pond and east diversion ditch were completed in the fall. A new access road to the recycling facility and active landfill areas was constructed along the top of the existing waste mound just west of the East Cell expansion area. Landfilling was carried out in the area of Phases 3 and 4.

2013 An interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation. Leachate collection and pre-treatment was continued throughout 2013. A forcemain obstruction causing a cleanout flange failure resulting in a spill along Navan Road was experienced in December. The event was reported to the MOE and the City, the spill was cleaned up and the system repaired and returned to regular operations. Efforts were concentrated in completing the north facing waste slope west of the site access and the west facing waste slope. Landfilling was carried out in the area of Phases 3 and 4. In 2013 BFI partnered with a third party to develop a market for recycled drywall. Other materials recycled and re-used consist of glass, tires, cardboard, e-waste, shingles, wood, metals and white goods, aggregate, asphalt, rock and concrete, clean fill and impacted soils for re-use as cover material.

2014 An interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation and was expanded with the addition of horizontal collection wells. Leachate collection and pre-treatment was continued throughout 2014. Construction of the east expansion cell (Phase 1) drainage system was started in 2014 with completion anticipated in early 2015. Waste placement efforts were concentrated in completing the west facing slope (Phase 3). In 2014 BFI continued to recycle and re-use materials such as glass, tires, cardboard, e-waste, shingles,

wood, metals and white goods, aggregate, asphalt, rock and concrete, clean fill as well as impacted soils re-used as cover material.

2015 In 2015, the company changed its operating name from BFI Canada Inc. to Progressive Waste Solutions Canada Inc. Leachate collection and pre-treatment was continued throughout 2015. Construction of the east expansion cell (Phase 1) and drainage system which was started in 2014 was completed in 2015 and landfilling within the cell began in mid December. Waste placement efforts focused on completing the Phase 3 fill area and the west end of Phases 4 and 5 prior to starting waste placement in the new east cell. The interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation and was expanded with the addition of horizontal collection wells. In addition to recycling various waste materials, PWS in 2015 received MOECC approval for the treatment of contaminated soils.

2016 Leachate collection and pre-treatment was continued throughout 2016. Waste placement efforts continued in the new east cell (Phase 1). Contaminated soil placement to raise the grades to final elevations continued in the Phase 3 fill area and the west end of Phases 4 and 5. The interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation and was expanded with the addition of horizontal collection wells at the west end of Phase 5. Recycling and treatment of hydrocarbon impacted soils were on-going operations throughout 2016. Treated soils were used as final cover and to raise the grades in the east buffer adjacent the waste column. Cell construction continued in the north half of the east cell (Phase 6) and consisted of excavation work. A screening plant was added to the processing operations for the screening of oversize materials and rock. Amended Environmental Compliance Approval number 2427-AETKQ5 issued by the MOECC dated November 2016 was received for the construction and operation of an enclosed flare.

2017 Leachate collection and pre-treatment with discharge to the City of Ottawa sanitary sewer system was continued throughout 2017. In 2017, two Notices of Violation were issued by the City. One for over strength parameters in the leachate that were later addressed and the second for elevated volatile organic readings in a sampling manhole that was also addressed. Waste placement efforts continued in the east cell (Phase 1). The interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation and was expanded with the addition of a horizontal collection well in the active fill area and seven permanent vertical wells. Recycling and treatment of hydrocarbon impacted soils were on-going operations throughout 2017. Treated soils were used as final cover and to raise the grades in the east buffer adjacent the waste column. Cell construction continued in the north half of the east cell (Phase 6) and consisted of excavation work. Design of the final and permanent landfill gas flaring system was completed and submitted in December by Golder Associates Ltd. to the Technical Standards and Safety Authority (TSSA) for review and approval. In the spring of 2017, the company changed it's name to Waste Connections of Canada Inc.

2018 Leachate collection and pre-treatment with discharge to the City of Ottawa sanitary sewer system was continued throughout 2018. In 2018, one Notice of Violation was issued by the City for a leachate spill along Renaud Road. An obstruction to the discharge pipe inside the sampling manhole located on Renaud Road caused the manhole to fill and overflow onto Renaud Road. The event was reported to the MOE and the City, the spill was cleaned up and the system cleaned out and returned

to regular operations. Waste placement efforts continued in the east cell (Phase 1) and in October resumed in the Phase 4 area of the landfill. Excavation of the north east cell in Phase 6 was continued and construction of the leachate collection and drainage system was substantially completed. The interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation and was expanded with the connection of three vertical wells installed in late 2017. Recycling and treatment of hydrocarbon impacted soils were on-going operations throughout 2018. Treated soils were used as fill to raise the grades in the east buffer adjacent the waste column in the Phase 6 area..

2019 Leachate collection and pre-treatment with discharge to the City of Ottawa sanitary sewer system was continued throughout 2019. Construction of a new cell in Phase 6 was completed and an as-built report prepared by Golder Associates Ltd. was submitted to the Ministry of the Environment, Conservation and Parks. Waste placement efforts continued in Phase 1, in the area of Phase 4 and then in the new cell (Phase 6) for the last quarter of the year. The interim odour control system comprising of a landfill gas collection and flaring system continued to be in operation and was expanded with the addition of four permanent vertical wells in the area of Phase 4. Recycling and treatment of hydrocarbon impacted soils were on-going operations throughout 2019. Treated soils were used to raise the grades in the east buffer adjacent the waste column. An existing stormwater ditch along the north edge and the northwest edge of the new cell in Phase 6 was replaced by a large diameter culvert complete with concrete headwalls.

APPENDIX 5

EACMR

1.0 INTRODUCTION

1.1 Background

In August 2007, Waste Services (Canada) Inc. (WSI) now Waste Connections of Canada Inc. (WCC) received approval from the Minister of the Environment under the Environmental Assessment Act for expansion of the Navan Landfill in Ottawa, Ontario. Condition 4 of that approval required that WSI (WCC) prepare an annual compliance report describing the extent of compliance with the Environmental Assessment (EA) conditions of approval and the results of WSI's (WCC's) compliance monitoring program. In accordance with Condition 3 of the EA approval, WSI previously submitted a separate document proposing an EA Compliance Monitoring Program.

In October 2008 WSI (WCC) submitted the first Environmental Assessment Compliance Monitoring Report (EACMR), which was intended to fulfill condition 4 of the EA approval conditions. The report addressed the period August 3, 2007 to August 2, 2008. In November 2008, the Ministry expressed its general satisfaction with the EACMR and noted outstanding requirements. It also allowed WCC (WSI) to coordinate submission of the EACMR with submission of the Annual Operations and Monitoring Report which is submitted annually by March 31st. Accordingly, this EACMR is submitted as an Appendix to the Annual Report and covers the period January 1st to Dec. 31st, 2019.

The Ministry's EAAB File # is EA 02 08 02.

1.2 Report Organization

- The EACMR comprises six sections as follows:
- Introduction – provides an overview of the purpose, context of submission and structure of the report as well as the proponent's contact information and an overview of significant activities at the Navan Landfill during the reporting period;
- Physical Works/Mitigation Measures – are presented in Table A, which lists WCC's commitments to make physical improvements to the site and in-design mitigation measures made during the EA and subsequent review, and provides a discussion on WCC's progress in meeting the commitments;
- Studies and Other Commitments – during the EA and review of the EA, WCC made commitments to other studies or activities, such as developing an end use plan and property value protection plan. These and other commitments are listed in Table B and WCC's progress in meeting these requirements is assessed;

- Public Consultation – is presented in Table C, which lists commitments and conditions of approval involving public consultation. A discussion is provided summarizing consultation activities during the reporting period and assessing WCC's fulfillment of these requirements;
- EA Conditions of Approval – the conditions of EA approval contained in the Minister's letter are listed in Table D and WCC's progress in meeting these conditions is described.
- Compliance Status – the final section of the report summarizes the findings in Tables A – D and provides concluding remarks on the overall status of compliance with the EA. Potential non-compliance issues, if any, are discussed in this section.

1.3 Proponent Contact Information

Waste Connections of Canada Inc. (WCC) is a multi-regional, integrated solid waste services company providing collection, transfer, recycling, composting, and disposal services to its customers. WCC is committed to excellence in environmental management and to conducting its business in a manner which protects the environment, health and safety of its employees, customers and communities in which it operates. Waste Connections of Canada Inc. is the owner and operator of the Navan Waste Recycling and Disposal Facility. WCC's contact information is as follows:

Waste Connections of Canada Inc.

3354 Navan Road

Ottawa, ON

K4B 1M9

Attn: Mr. Henri Huneault, Landfill Manager

2.0 PHYSICAL WORKS/MITIGATION MEASURES

There were thirteen (13) commitments made by WSI during the EA and subsequent review process. These commitments relate to installation of physical works and/or implementation of mitigation measures. WSI (WCC) made the majority of the commitments during the EA as documented in the EA Study Report (EASR). Table A provides a listing of the outstanding commitments during the current reporting period. For each commitment a reference is provided regarding the documented source of the commitment, the time frame in which it is expected to be implemented and comments on WCC's progress in fulfilling the commitment such as 'completed', 'in progress', 'ongoing' etc.

WCC has now completed nine (9) of the original thirteen (13) commitments in Table A and the remaining four (4) are ongoing. There are no non-compliance issues.

Table A: EA Compliance Status for Physical Works and Mitigation Measures

Commitments	Where Commitment Made	Implementation Schedule	Status
A-5: WCC will install an active gas management system consistent with the requirements of Ontario Regulation 232/98.	▪ Section 8.3 of the EASR.	Landfill gas/odour control system will begin construction in 2010 and the remainder phased in as the landfill is developed.	**Ongoing** Studies for landfill gas completed in 2009. Approved interim LFG odour control system header pipe and connections abstraction plant and candlestick flare equipment was completed in 2011 and commissioned in early 2012. The operation and expansion of the system as required is on-going. Final Design of permanent enclosed flaring system was completed in 2017 and modified in 2019. In 2019 four vertical landfill gas wells were added and connected to the interim odour control system.
A-6: WSI will undertake best management practices (BMP) for dust control.	▪ Section 8.3 of the EASR.	Following receipt of all necessary approvals to allow expansion of the Navan Landfill and ongoing during operations.	**Ongoing** Best management practices for dust control have been implemented in 2009 and will continue over the operating life of the landfill. A wheel wash system was constructed and commissioned in late 2009 and operated from April to November, 2019 to reduce dirt and mud drag out onto paved roads (internal roads and Navan Road). A Best Management Practices Plan for Fugitive Dust Control was completed by Dillon Consulting dated October 2015 and submitted to the MOECC in accordance with the requirement of an amendment for the treatment of contaminated soils.

Table A: EA Compliance Status for Physical Works and Mitigation Measures

Commitments	Where Commitment Made	Implementation Schedule	Status
A-7: WSI will vegetate side slopes and berms in order for the landfill to blend in as much as possible with the environment. Species native to Site area will be used wherever possible.	▪ Section 9.1 of the EASR	Following receipt of all necessary approvals to allow expansion of the Navan Landfill. Vegetation planting will be ongoing during operations. Details of vegetation planting will be refined during the EPA approval process.	**Ongoing** Approvals have been received. In 2019 vegetation was maintained and preserved where possible. The south, north and west facing waste slopes have been covered with final cover and seeded. Additional tree planting at the top of the landfill as closure progresses is on-going.
Commitments	Where Commitment Made	Implementation Schedule	Status
A-12: Best management practices (BMP) will be used to mitigate dust from activities at the Navan landfill application.	▪ Response to MOE GRT Comments, p. 24 ▪ MOE EA Approval Condition # 10.5	Following receipt of all necessary approvals to allow expansion of the Navan Landfill and ongoing during operations.	**Ongoing** Approvals received

3.0 STUDIES AND OTHER COMMITMENTS

WSI (WCC) agreed to undertake a total of thirty one (31) studies and additional tasks/commitments during the course of the EA and subsequent review. Table B lists the outstanding commitments during the reporting period along with a brief description of their status. Of the thirty one (31) original commitments listed in Table B, WCC has completed all but three (3) with one (1) not yet started, one (1) ongoing and one (1) in progress. Most of the completed commitments relate to providing additional information and detail during the EPA approval process.

There are no issues with non-compliance associated with any of the Table B commitments.

Table B: EA Compliance Status for Studies and Other Communication

Commitments	Where Commitment Made	Implementation Schedule	Status
B-1: WSI will undertake an evaluation of end-use alternatives.	▪ EASR Table 8.3-1, p. 120d	Three years prior to the landfill closure.	**Not yet started** The evaluation of end use alternatives will be undertaken and documented as part of a closure plan to the MOECC as required by Regulation 232/98. Status of the development of the end use plan will be reported in the EACMR section of the annual O&M Report to the MOECC starting three years prior to site closure.
B-3: WSI will continue to pursue further waste diversion programs as appropriate.	▪ EASR p.120e	Schedule is based on economic and technical viability and approvals.	**Ongoing** Treatment of hydrocarbon contaminated soils along with the recycling and re-use of other landfill materials such as glass, wood, metals, roofing shingles, aggregates, tires and other materials was on-going throughout 2019.
B-11: WSI will maintain sufficient financial assurance for proper decommissioning of the site in keeping with MOE requirements, community plans and input from the PAC.	▪ WSI – Friends of Mer Bleue Agreement	Following receipt of all necessary approvals to allow expansion of the Navan Landfill.	**In Progress** Financial assurance plan is in place and will be maintained throughout the life of the landfill site.

4.0 PUBLIC CONSULTATION

WSI agreed to seven (7) commitments regarding public consultation during the EA, including the formation of a Public Advisory Committee (PAC). The status of these commitments is provided in Table C. All four (4) of the commitments remaining are ongoing.

Table C: EA Compliance Status for Public Consultations

Commitments	Where Commitment Made	Implementation Schedule	Status
C-3: WSI will work with the PAC on an ongoing basis to consider enhanced opportunities to improve re-cycling and diversion at the Navan Road Landfill to work towards the diversion goals articulated by the City of Ottawa and the province.	▪ WSI – Friends of Mer Bleue Agreement	Following receipt of all necessary approvals to allow expansion of the Navan Landfill and completion of the City's study.	**Ongoing** Treatment of hydrocarbon contaminated soils along with the recycling and re-use of other landfill materials such as glass, wood, metals, roofing shingles, aggregates, tires and other materials was on-going throughout 2019. WCC continues to add marketable materials to its recycling efforts.
C-4: WSI will work with the PAC on an ongoing basis to consider other opportunities to reduce odour, dust and road dirt.	▪ WSI – Friends of Mer Bleue Agreement	Following receipt of all necessary approvals to allow expansion of the Navan Landfill.	**Ongoing** A wheel wash station was constructed and commissioned at the end of 2009. Construction of an interim odour control system was completed in 2011 and commissioned in early 2012. Four vertical landfill gas wells were added to the interim odour control system in 2019. Final design of a permanent landfill gas system was completed in 2017 and modified in 2019.
C-5: WSI is prepared to address new issues arising from the EA or detailed EPA assessment work and will work with the PAC on these issues.	▪ WSI – Friends of Mer Bleue Agreement	As these issues become known.	**Ongoing**

Table C: EA Compliance Status for Public Consultations

Commitments	Where Commitment Made	Implementation Schedule	Status
C-7: WSI will work with the City of Ottawa, the Friends of the Mer Bleue and the PAC to identify and develop community projects to enhance and improve the community and its public spaces.	▪ WSI – Friends of Mer Bleue Agreement	Following receipt of all necessary approvals to allow expansion of the Navan Landfill.	**Ongoing** An agreement for a funding mechanism by WCC for community projects was included in the Terms of Reference for the PAC. A number of community projects were funded in 2019 by the WCC-PAC fund. Again in 2019, $22,000 in scholarships were awarded to 11 high schools for a qualifying local student pursuing post secondary studies in environmental science.

5.0 EA CONDITIONS OF APPROVAL

In the Notice of Approval to Proceed with the Undertaking, the Minister of the Environment listed forty three (43) conditions grouped into ten (10) categories of which sixteen (16) remain, as listed in Table D. Many of these conditions result from commitments made by WSI (WCC) during the EA review and are listed in Tables A, B or C. For convenience to the reader, cross-references have been provided to the corresponding WSI (WCC) commitment listed in Tables A, B or C. Where no cross-reference is available (i.e., this is a new condition), "not applicable" (n/a) is recorded in Table D. It should be noted that many of the conditions are the same as WSI (WCC) commitments contained in Tables A, B and C.

No non-compliance issues have been identified.

Table D: EA Compliance Status for Conditions of EA Approval

Conditions	Where Commitment Made	Implementation Schedule	Status
1. General Requirements			
1.1 The proponent shall comply with the provisions in the EA which are hereby incorporated in this approval by reference except as provided in these conditions and as provided in any other approval or permit that may be issued for the site.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**
1.2 The proponent shall implement any additional commitments made by them and recorded in their response and attachments as noted above, except as provided for in these conditions or as provided for under other approvals, authorizations or permits required for the undertaking.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**
1.3 These conditions do not prevent more restrictive conditions being imposed under other statutes.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**

Table D: EA Compliance Status for Conditions of EA Approval

Conditions	Where Commitment Made	Implementation Schedule	Status
2. Public Record			
2.1 Where a document is required for the public record, the proponent shall provide two copies of the document to the Director, one copy for filing within the specific public record file maintained for the undertaking and one copy for staff use.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**
2.2 The proponent shall provide additional copies of such documents at the request of the: • Regional Director; • Clerk of the City of Ottawa; and, • PAC.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**
2.3 The proponent shall quote EAAB file number EA 02 08 02 on the documents.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**
2.4 The proponent may also provide these documents through other means as it considers appropriate.	n/a	Throughout the operation of the landfill in accordance with the EA approval.	**Ongoing**

Table D: EA Compliance Status for Conditions of EA Approval

Conditions	Where Commitment Made	Implementation Schedule	Status
3. Compliance Monitoring Program			
3.6 The proponent shall carry out the monitoring program as amended by the Director.	n/a	Throughout the operation of the landfill until all conditions/commitments have been fulfilled.	**Ongoing**
3.7 The proponent shall make the documentation available to the ministry or it's designate upon request in a timely manner when so requested by the ministry during an on-site inspection, audit, or response to a pollution incident report or when information concerning compliance is requested by the ministry.	n/a	Throughout the operation of the landfill until all conditions/commitments have been fulfilled.	**Ongoing**
4. Compliance Reporting			
4.1 The proponent shall prepare an annual compliance report which describes compliance with the conditions of approval set out in this notice and which describes the results of the proponent's EA compliance monitoring program.	n/a	The EACMR is required annually, until all conditions have been met. MOE has agreed for EACMR to be submitted annually April 1 with the Annual O & M Report.	**Ongoing**

Table D: EA Compliance Status for Conditions of EA Approval

Conditions	Where Commitment Made	Implementation Schedule	Status
4.2 The proponent shall issue the first compliance report no later than one year following the date of this approval, and in each subsequent year shall issue a compliance report covering the previous year, on the date that is the anniversary of this approval or the proponent can coordinate the timing of its reporting with its annual Design and Operations report required under the EPA.			**Ongoing**
4.3 The proponent shall submit the annual compliance report to the Director for placement on the public record.			**Ongoing**
4.4 The proponent shall submit annual compliance reports until all conditions of this approval are satisfied.	n/a	Beginning in 2008 and annually during the operation of the landfill until all conditions have been satisfied.	**Ongoing** The first annual EACMR was submitted in 2008 and are provided annually attached to the Operations and Monitoring Report
4.5 When all conditions have been satisfied, the proponent shall indicate in the annual compliance report that this is its final submission.	n/a		**Ongoing**
4.6 The proponent shall retain either on site or in another location approved by the Director, copies of the annual compliance reports for each reporting year and any associated documentation of compliance monitoring activities.	n/a	Throughout the operation of the landfill until all conditions/commitments have been fulfilled.	**Ongoing** In 2008, WSI established a library on site where EACMR and associated documentation is available for viewing by the public.

Table D: EA Compliance Status for Conditions of EA Approval

Conditions	Where Commitment Made	Implementation Schedule	Status
4.7 The proponent shall make the documentation available to the ministry or it's designate upon request in a timely manner when so requested by the ministry during an on-site inspection, audit, or in response to a pollution incident report or when information concerning compliance is requested by the ministry.	n/a		**Ongoing**
5. Public Advisory Committee			
5.4 The proponent may dispense with the PAC if, after a period of time and after giving sufficient notice, there is no interest from the public in continuing with it. The proponent shall review the need for such a PAC yearly.	n/a	Ongoing through operational life of landfill expansion	**Ongoing**
6. Planting Plan			
6.3 The proponent shall make best efforts to protect existing mature trees and vegetation on site that could be used to screen the construction of the landfill berms, where appropriate.			**Ongoing** On-going throughout life of the landfill.

6.0 COMPLIANCE STATUS

WSI (WCC) made a total of 51 commitments during the EA and subsequent review as listed in Tables A, B and C. Eleven (11) commitments remain "ongoing" or "in progress". In other words, about 78% of the original commitments have now been fulfilled and some will remain in ongoing throughout the operating life of the Site.

The Minister listed fourty three (43) conditions in her Notice of Approval to Proceed with the undertaking, which are listed in Table D. Several conditions (13) were derived from WSI commitments made during the EA and subsequent review. Eighteen (18) conditions remain at the end of the reporting period and will remain ongoing throughout the operating life of the landfill. WCC continues to make progress in all of the remaining conditions.

No non-compliance issues were identified during the report period.

Normand G Castonguay

LIST OF ABBREVIATIONS

The abbreviations commonly employed on Records of Boreholes, on figures, and in the text of the report are as follows:

I. SAMPLE TYPE

AS	Auger sample
BS	Block sample
CS	Chunk sample
DO or DP	Seamless open-ended, driven or pushed tube samplers
DS	Denison type sample
FS	Foil sample
RC	Rock core
SC	Soil core
SS	Split spoon sampler
ST	Slotted tube
TO	Thin-walled, open
TP	Thin-walled, piston
WS	Wash sample
DT	Dual tube sample
DD	Diamond drilling

II. PENETRATION RESISTANCE

Standard Penetration Resistance (SPT), N:

The number of blows by a 63.5 kg. (140 lb.) hammer dropped 760 mm (30 in.) required to drive a 50 mm (2 in.) split spoon sampler for a distance of 300 mm (12 in.).

Dynamic Cone Penetration Resistance (DCPT); N_d:

The number of blows by a 63.5 kg (140 lb.) hammer dropped 760 mm (30 in.) to drive an uncased 50 mm (2 in.) diameter, 60^0 cone attached to "A" size drill rods for a distance of 300 mm (12 in.).

PH:	Sampler advanced by hydraulic pressure
PM:	Sampler advanced by manual pressure
WH:	Sampler advanced by static weight of hammer
WR:	Sampler advanced by weight of sampler and rod

Cone Penetration Test (CPT):

An electronic cone penetrometer with a 60^0 conical tip and a projected end area of 10 cm^2 pushed through ground at a penetration rate of 2 cm/s. Measurements of tip resistance (q_t), porewater pressure (u) and friction along a sleeve are recorded electronically at 25 mm penetration intervals.

III. SOIL DESCRIPTION

(a) Cohesionless Soils

Density Index (Relative Density)	**N** Blows/300 mm Or Blows/ft.
Very loose	0 to 4
Loose	4 to 10
Compact	10 to 30
Dense	30 to 50
Very dense	over 50

(b) Cohesive Soils

C_u or S_u

Consistency	kPa	Psf
Very soft	0 to 12	0 to 250
Soft	12 to 25	250 to 500
Firm	25 to 50	500 to 1,000
Stiff	50 to 100	1,000 to 2,000
Very stiff	100 to 200	2,000 to 4,000
Hard	Over 200	Over 4,000

IV. SOIL TESTS

w	Water content
w_p or PL	Plastic limited
w_1 or LL	Liquid limit
C	Consolidaiton (oedometer) test
CHEM	Chemical analysis (refer to text)
CID	Consolidated isotropically drained triaxial test[1]
CIU	Consolidated isotropically undrained triaxial test with porewater pressure measurement[1]
D_R	Relative density
DS	Direct shear test
Gs	Specific gravity
M	Sieve analysis for particle size
MH	Combined sieve and hydrometer (H) analysis
MPC	Modified Proctor compaction test
SPC	Standard Proctor compaction test
OC	Organic content test
SO_4	Concentration of water-soluble sulphates
UC	Unconfined compression test
UU	Unconsolidated undrained triaxial test
V	Field vane test (LV-laboratory vane test)
γ	Unit weight

Note: [1] Tests which are anisotropically consolidated prior shear are shown as CAD, CAU.

LIST OF SYMBOLS

Unless otherwise stated, the symbols employed in the report are as follows:

I. GENERAL

π	3.1416
ln x	natural logarithm of x
$\log_{10}$ x or log x	logarithm of x to base 10
g	acceleration due to gravity
t	time
FOS	factor of safety
V	volume
W	weight

II. STRESS AND STRAIN

γ	shear strain
Δ	change in, e.g. in stress: $\Delta \sigma'$
ε	linear strain
ε_v	volumetric strain
η	coefficient of viscosity
ν	Poisson's ratio
σ	total stress
σ'	effective stress ($\sigma' = \sigma - u$)
σ'_{vo}	initial vertical effective overburden stress
$\sigma_1\sigma_2\sigma_3$	principal stresses (major, intermediate, minor)
σ_{oct}	mean stress or octahedral stress $= (\sigma_1 + \sigma_2 + \sigma_3) / 3$
τ	shear stress
u	porewater pressure
E	modulus of deformation
G	shear modulus of deformation
K	bulk modulus of compressibility

III. SOIL PROPERTIES

(a) Index Properties

$\rho(\gamma)$	bulk density (bulk unit weight)*
$\rho_d(\gamma_d)$	dry density (dry unit weight)
$\rho_w(\gamma_w)$	density (unit weight) of water
$\rho_s(\gamma_s)$	density (unit weight) of solid particles
γ'	unit weight of submerged soil ($\gamma' = \gamma - \gamma_w$)
D_R	relative density (specific gravity) of solid particles ($D_R = \rho_s / \rho_w$) formerly (G_s)
e	void ratio
n	porosity
S	degree of saturation

* Density symbol is ρ. Unit weight symbol is γ where $\gamma = \rho g$ (i.e. mass density multiplied by acceleration due to gravity)

(a) Index Properties (continued)

w	water content
w_1 or LL	liquid limit
w_p or PL	plastic limit
I_p or PI	plasticity Index = $(w_1 - w_p)$
w_s	shrinkage limit
I_L	liquidity index = $(w - w_p) / I_p$
I_c	consistency index = $(w_1 - w) / I_p$
e_{max}	void ratio in loosest state
e_{min}	void ratio in densest state
I_D	density index = $(e_{max} - e) / (e_{max} - e_{min})$ (formerly relative density)

(b) Hydraulic Properties

h	hydraulic head or potential
q	rate of flow
v	velocity of flow
i	hydraulic gradient
k	hydraulic conductivity (coefficient of permeability)
j	seepage force per unit volume

(c) Consolidation (one-dimensional)

C_c	compression index (normally consolidated range)
C_r	recompression index (overconsolidated range)
C_s	swelling index
C_α	coefficient of secondary consolidation
m_v	coefficient of volume change
c_v	coefficient of consolidation (vertical direction)
T_v	time factor (vertical direction)
U	degree of consolidation
σ'_p	pre-consolidation stress
OCR	overconsolidation ratio = σ'_p / σ'_{vo}

(d) Shear Strength

τ_p or τ_r	peak and residual shear strength
ϕ'	effective angle of internal friction
δ	angle of interface friction
μ	coefficient of friction = tan δ
c'	effective cohesion
c_u or s_u	undrained shear strength ($\phi = 0$ analysis)
p	mean total stress $(\sigma_1 + \sigma_3) / 2$
p'	mean effective stress $(\sigma'_1 + \sigma'_3) / 2$
q	$(\sigma_1 - \sigma_3) / 2$ or $(\sigma'_1 - \sigma'_3) / 2$
q_u	compressive strength $(\sigma_1 - \sigma_3)$
S_t	sensitivity

Notes:
[1] $\tau = c' + \sigma' \tan \phi'$
[2] shear strength = (compressive strength) / 2

Qualifier Notes:

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

QS-02 : Spike level outside of control limits. Analysis batch accepted based on other QC included in the batch.

Sample Data Revisions

Report Date: 28-Jun-2019
Order Date: 21-Jun-2019
Project Description: 18113613

Qualifier Notes:

Login Qualifiers :

Samples received submerged in water, possibly melted ice. This condition can compromise sample integrity.
Applies to samples: SED-W, SED-C, SED-E

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Qualifier Notes:

Sample Qualifiers :

1 : Raised Reporting Limits for BOD due to dilutions based on preliminary COD screening results.

QC Qualifiers :

BOD01 : Raised Reporting Limits for BOD due to dilutions based on preliminary COD screening results.

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

QS-02 : Spike level outside of control limits. Analysis batch accepted based on other QC included in the batch.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Analysis Summary Table

Analysis	Method Reference/Description	Extraction Date	Analysis Date
Alkalinity, bicarbonate	calculated from EPA 310.1 - Titration to pH 4.5	22-Jun-19	22-Jun-19
Alkalinity, carbonate	calculated from EPA 310.1 - Titration to pH 4.5	21-Jun-19	22-Jun-19
Alkalinity, total to pH 4.5	EPA 310.1 - Titration to pH 4.5	21-Jun-19	22-Jun-19
Ammonia, as N	EPA 351.2 - Auto Colour	24-Jun-19	26-Jun-19
Anions	EPA 300.1 - IC	24-Jun-19	25-Jun-19
Chemical Oxygen Demand	EPA 410.1 - Digestion, Colourimetric	24-Jun-19	24-Jun-19
Golder General Chemistry- GW	Hardness as CaCO3	24-Jun-19	24-Jun-19
Metals, ICP-MS	EPA 200.8 - ICP-MS	24-Jun-19	24-Jun-19
Phenolics	EPA 420.2 - Auto Colour, 4AAP	24-Jun-19	24-Jun-19
Phosphorus, total, water	EPA 365.4 - Auto Colour, digestion	25-Jun-19	26-Jun-19
Total Dissolved Solids	SM 2540C - gravimetric, filtration	24-Jun-19	25-Jun-19
Total Kjeldahl Nitrogen	EPA 351.2 - Auto Colour, digestion	25-Jun-19	26-Jun-19
VOCs by P&T GC-MS	EPA 624 - P&T GC-MS	25-Jun-19	25-Jun-19

Qualifier Notes:

Sample Qualifiers :

1 : Elevated detection limit because of dilution required due to the presence of high levels of non-target analytes.

QC Qualifiers :

QM-07 : The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on other acceptable QC.

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Analysis Summary Table

Analysis	Method Reference/Description	Extraction Date	Analysis Date
Alkalinity, total to pH 4.5	EPA 310.1 - Titration to pH 4.5	30-Aug-19	30-Aug-19
Ammonia, as N	EPA 351.2 - Auto Colour	3-Sep-19	3-Sep-19
Anions	EPA 300.1 - IC	30-Aug-19	30-Aug-19
Biochemical Oxygen Demand	SM 5210B - DO Probe	30-Aug-19	4-Sep-19
Chemical Oxygen Demand	EPA 410.1 - Digestion, Colourimetric	30-Aug-19	30-Aug-19
Dissolved Organic Carbon	MOE E3247B - Combustion IR, filtration	29-Aug-19	30-Aug-19
Golder General Chemistry- SW	Hardness as CaCO3	3-Sep-19	4-Sep-19
Metals, ICP-MS	EPA 200.8 - ICP-MS	3-Sep-19	4-Sep-19
Phenolics	EPA 420.2 - Auto Colour, 4AAP	30-Aug-19	3-Sep-19
Phosphorus, total, water	EPA 365.4 - Auto Colour, digestion	30-Aug-19	30-Aug-19
Total Dissolved Carbon	MOE 3247B - Combustion IR	30-Aug-19	30-Aug-19
Total Dissolved Solids	SM 2540C - gravimetric, filtration	3-Sep-19	4-Sep-19
Total Kjeldahl Nitrogen	EPA 351.2 - Auto Colour, digestion	30-Aug-19	30-Aug-19
Total Suspended Solids	SM 2540D - Gravimetric	30-Aug-19	30-Aug-19

Qualifier Notes:

Login Qualifiers :

Container(s) - Labeled improperly/insufficient information -
Applies to samples: S-21

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

QR-05 : Duplicate RPDs higher than normally accepted. Remaining batch QA\QC was acceptable. May be sample effect.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Certificate of Analysis

Golder Associates Ltd. (Ottawa)

1931 Robertson Rd.
Ottawa, ON K2H 5B7
Attn: Yannick Marcerou

Client PO: 7145-17-00370
Project: 18113613
Custody:

Report Date: 4-Sep-2019
Order Date: 28-Aug-2019

Order #: 1935458

This Certificate of Analysis contains analytical data applicable to the following samples as submitted:

Paracel ID	Client ID
1935458-01	L-5

Approved By:

Dale Robertson, BSc
Laboratory Director

Any use of these results implies your agreement that our total liabilty in connection with this work, however arising, shall be limited to the amount paid by you for this work, and that our employees or agents shall not under any circumstances be liable to you in connection with this work.

Qualifier Notes:

Sample Qualifiers :

1 : Note that Ammonia (as N) results are greater than TKN results due to the error associated to higher than normal sample dilutions.

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

QR-05 : Duplicate RPDs higher than normally accepted. Remaining batch QA\QC was acceptable. May be sample effect.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Soil results are reported on a dry weight basis when the units are denoted with 'dry'.
Where %Solids is reported, moisture loss includes the loss of volatile hydrocarbons.

Qualifier Notes:

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Report Date: 03-Dec-2019
Order Date: 22-Nov-2019
Project Description: 18113613/2000

Qualifier Notes:

Sample Qualifiers :

1 : Raised Reporting Limits for BOD due to dilutions based on preliminary COD screening results.

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Qualifier Notes:

Login Qualifiers :

Samples received submerged in water, possibly melted ice. This condition can compromise sample integrity.
Applies to samples: MW-C

Sample Qualifiers :

1 : Elevated Reporting Limit due to matrix interference.

QC Qualifiers :

QR-01 : Duplicate RPD is high, however, the sample result is less than 10x the MDL.

Sample Data Revisions

None

Work Order Revisions / Comments:

None

Other Report Notes:

n/a: not applicable
ND: Not Detected
MDL: Method Detection Limit
Source Result: Data used as source for matrix and duplicate samples
%REC: Percent recovery.
RPD: Relative percent difference.

Report of Monitoring Results - Groundwater
Up-Gradient Monitoring Wells

Footnotes:

	Tables should be read in conjunction with the accompanying document.
<	Indicates parameter not detected above laboratory method detection limit.
>	Indicates parameter detected above equipment analytical range.
--	Chemical not analyzed or criteria not defined.
Value	Parameter is greater than ODWQS(169/03)-Health
Value	Parameter is greater than ODWQS-AO
(1)	Ontario Drinking Water Quality Standards - Health Based Standards (June 2003, revised January 2018).
(2)	Ontario Drinking Water Quality Standards - Aesthetic Objectives. Aesthetic Objectives are established for parameters that may impair the taste, odour or colour of water or which may interfere with good water quality control practices. For certain parameters, both aesthetic objectives and health-related MACs have been derived (June 2003, revised June 2006).
(3)	Nitrite/Nitrate: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.
(4)	There may be a laxative effect in some individuals when sulphate levels exceed 500 mg/L.
(5)	The aesthetic objective for sodium in drinking water is 200 mg/L. The local Medical Officer of Health should be notified when the sodium concentration exceeds 20 mg/L so that this information may be communicated to local physicians for their use with patients on sodium restricted diets.
(6)	Elevated detection limit due to dilution required because of high target analyte concentration.
(7)	Elevated Reporting Limit due to matrix interference.
(8)	Elevated Reporting Limit due to matrix interference.
(9)	Elevated detection limit because of dilution required due to the presence of high levels of non-target analytes.
(10)	Due to the sample matrix, sample required dilution. Detection limit was adjusted accordingly.
(11)	Monitoring location was dry during this sampling event. No sample was collected.
(12)	Arsenic MRL elevated due to matrix interference.
(13)	pH < 8.3. Calculations not available.
(14)	Insufficient water for sample collection or analysis at this monitoring location during sampling event.
(15)	Monitoring location has been decommissioned.
(16)	Due to matrix interference 10x dilution factor required for VOCs.
(17)	VOC Water Analysis: Due to foaming, sample required dilution. The detection limits were adjusted accordingly.

Immediately Downgradient Groundwater Monitoring Wells

Footnotes:

	Tables should be read in conjunction with the accompanying document.
<	Indicates parameter not detected above laboratory method detection limit.
>	Indicates parameter detected above equipment analytical range.
--	Chemical not analyzed or criteria not defined.
Value	Parameter is greater than ODWQS(169/03)-Health
Value	Parameter is greater than ODWQS-AO
(1)	Ontario Drinking Water Quality Standards - Health Based Standards (June 2003, revised January 2018).
(2)	Ontario Drinking Water Quality Standards - Aesthetic Objectives. Aesthetic Objectives are established for parameters that may impair the taste, odour or colour of water or which may interfere with good water quality control practices. For certain parameters, both aesthetic objectives and health-related MACs have been derived (June 2003, revised June 2006).
(3)	Monitoring location was dry during this sampling event. No sample was collected.
(4)	Arsenic MRL elevated due to matrix interference.
(5)	VOC Water Analysis: Due to foaming, sample required dilution. The detection limits were adjusted
(6)	There may be a laxative effect in some individuals when sulphate levels exceed 500 mg/L.
(7)	The aesthetic objective for sodium in drinking water is 200 mg/L. The local Medical Officer of Health should be notified when the sodium concentration exceeds 20 mg/L so that this information may be communicated to local physicians for their use with patients on sodium restricted diets.
(8)	pH < 8.3. Calculations not available.
(9)	Elevated detection limit because of dilution required due to the presence of high levels of non-target analytes.
(10)	Elevated Reporting Limit due to matrix interference.
(11)	Elevated Reporting Limit due to matrix interference.
(12)	VOC Water Analysis: Due to foaming, sample required dilution. The detection limits were adjusted accordingly.Nitrite/Nitrate: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.
(13)	Elevated detection limit due to dilution required because of high target analyte concentration.
(14)	Nitrite/Nitrate: Due to the colour interferences, sample required dilution. Detection limits were adjusted
(15)	Nitrite/Nitrate: Due to the sample matrix, sample required dilution. Detection limits were adjusted
(16)	VOC Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted
(17)	Detection Limit was raised due to matrix interferences.
(18)	pH Parameter was not measured.
(19)	Elevated ion balance was confirmed by re-analysis.
(20)	TKN results may be biased low due to elevated dissolved salt content.
(21)	Metals MRL elevated due to matrix interference.
(22)	VOC Analysis: Due to high concentrations of non-target analytes, sample required dilution. Detection limits were adjusted accordingly.
(23)	VOC Analysis: Due to high concentrations of non- target analytes, sample required dilution. Detection limits were adjusted accordingly.
(24)	Elevated ion balance result was confirmed by re-analysis.
(25)	Inadvertently, no sample was collected at this location.

Nitrite as N	mg/l	1.0	--	<0.05	--	<0.05	--	--	<0.05
Nitrogen, Total Kjeldahl	mg/l	--	--	7.8	--	6.2	--	--	12.5
Nitrogen, Nitrate-Nitrite	mg/l	--	--	--	--	--	--	--	--
pH	-	--	--	--	--	--	--	--	--
pH (Field)	-	--	--	7.55	--	6.80	--	--	6.82
Phosphorus	mg/l	--	--	0.86	--	0.23	--	--	0.62
Sulphate	mg/l	--	500 [5]	<1	--	<1	--	--	2
Temperature (Field)	deg c	--	15	18.6	--	18.1	--	--	4.9
Total Dissolved Solids	mg/l	--	500	196	--	212	--	--	238
Metals									
Arsenic, dissolved	mg/l	0.01	--	<0.001	--	<0.001	--	--	<0.001
Boron, dissolved	mg/l	5	--	0.037	--	0.064	--	--	0.044
Cadmium, dissolved	mg/l	0.005	--	<0.0001	--	<0.0001	--	--	<0.0001
Calcium, dissolved	mg/l	--	--	4.07	--	6.48	--	--	5.97
Chromium, dissolved	mg/l	0.05	--	<0.001	--	<0.001	--	--	<0.001
Cobalt, dissolved	mg/l	--	--	<0.0005	--	<0.0005	--	--	<0.0005
Copper, dissolved	mg/l	--	1	<0.0005	--	<0.0005	--	--	0.0014
Iron, dissolved	mg/l	--	0.3	0.682	--	0.984	--	--	0.679
Lead, dissolved	mg/l	0.01	--	<0.0001	--	0.0001	--	--	0.0002
Magnesium, dissolved	mg/l	--	--	3.55	--	6.31	--	--	4.97
Manganese, dissolved	mg/l	--	0.05	0.089	--	0.14	--	--	0.098
Potassium, dissolved	mg/l	--	--	1.6	--	2.2	--	--	2.86
Sodium, dissolved	mg/l	--	200 [6]	40.8	--	71.4	--	--	63.2
Zinc, dissolved	mg/l	--	5	0.024	--	<0.005	--	--	<0.005
Phenols									
Phenolics, Total Recoverable	mg/l	--	--	0.005	--	<0.001	--	--	0.008
VOCs									
1,1-Dichloroethane	mg/l	--	--	<0.0005	--	<0.0005	--	--	<0.0005
Benzene	mg/l	0.001	--	<0.0005	--	<0.0005	--	--	<0.0005
Ethylbenzene	mg/l	0.14	0.0016	<0.0005	--	<0.0005	--	--	<0.0005
m,p-Xylenes	mg/l	--	--	<0.0005	--	<0.0005	--	--	<0.0005
Methylene Chloride	mg/l	0.05	--	<0.0050	--	<0.0050	--	--	<0.0050
o-Xylene	mg/l	--	--	<0.0005	--	<0.0005	--	--	<0.0005
Toluene	mg/l	0.06	0.024	<0.0005	--	<0.0005	--	--	<0.0005
Vinyl Chloride	mg/l	0.001	--	<0.0005	--	<0.0005	--	--	<0.0005

Footnotes:

	Tables should be read in conjunction with the accompanying document.
<	Indicates parameter not detected above laboratory method detection limit.
>	Indicates parameter detected above equipment analytical range.
--	Chemical not analyzed or criteria not defined.
Value	Parameter is greater than ODWQS(169/03)-Health
Value	Parameter is greater than ODWQS-AO
(1)	Ontario Drinking Water Quality Standards - Health Based Standards (June 2003, revised January 2018).
(2)	Ontario Drinking Water Quality Standards - Aesthetic Objectives. Aesthetic Objectives are established for parameters that may impair the taste, odour or colour of water or which may interfere with good water quality control practices. For certain parameters, both aesthetic objectives and health-related MACs have been derived (June 2003, revised June 2006).
(3)	Monitoring location was frozen during this sampling event. No sample was collected.
(4)	Monitoring location could not be located during this sampling event.
(5)	There may be a laxative effect in some individuals when sulphate levels exceed 500 mg/L.
(6)	The aesthetic objective for sodium in drinking water is 200 mg/L. The local Medical Officer of Health should be notified when the sodium concentration exceeds 20 mg/L so that this information may be communicated to local physicians for their use with patients on sodium restricted diets.
(7)	Metals MRL elevated due to matrix interference.
(8)	pH < 8.3. Calculations not available.
(9)	Elevated Reporting Limit due to matrix interference.
(10)	Elevated detection limit because of dilution required due to the presence of high levels of non-target analytes.
(11)	Elevated Reporting Limit due to matrix interference.
(12)	Due to matrix interference 2 X dilution factor required for VOCs. Arsenic MRL elevated due to matrix interference.
(13)	N-NO2,N-NO3 MRL elevated due to matrix interference.
(14)	Due to matrix interference 2 X dilution factor required for VOCs. TP MRL elevated due to insufficient sample volume.
(15)	N-NO2,N-NO3 MRL elevated due to matrix interference. Sediment was not included in Metals Analysis.
(16)	Nitrite/Nitrate: Due to colour interferences, sample required dilution. Detection limits were adjusted accordingly.
(17)	Monitoring location was dry during this sampling event. No sample was collected.
(18)	Insufficient sample volume was collected for analysis.
(19)	Due to the sample matrix, sample required dilution. Detection limit was adjusted accordingly.
(20)	TKN MRL elevated due to matrix interference. Metals MRL elevated due to matrix interference.
(21)	Arsenic MRL elevated due to matrix interference. Due to matrix interference 10x dilution factor required for VOCs.
(22)	Metal Analysis:Due to the sample matrix, sample required dilution. Detection limit was adjusted accordingly.
(23)	VOC Water Analysis: Due to foaming, sample required dilution. The detection limits were adjusted accordingly.Metals Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.
(24)	Elevated detection limit due to dilution required because of high target analyte concentration.
(25)	INOG6 Note that Ammonia (as N) results are greater than TKN results due to the error associated to higher than normal sample dilutions.
(26)	Arsenic MRL elevated due to matrix interference.

(27) Elevated ion balance result was confirmed by re-analysis.
(28) VOC Water Analysis: Due to foaming, sample required dilution. The detection limits were adjusted accordingly.
(29) Metal Analysis:Detection Limit was raised due to matrix interferences.
(30) VOC Analysis: Due to high concentrations of non-target analytes, sample required dilution. Detection limits were adjusted accordingly.
(31) Elevated ion balance was confirmed by re-analysis.
(32) TKN results may be biased low due to elevated dissolved salt content.
(33) Detection Limit was raised due to matrix interferences.
(34) Due to matrix interference 10x dilution factor required for VOCs.
(35) Due to matrix interference 2x dilution factor required for VOCs.
(36) VOC Analysis: Due to high sediment in vials resulting in smaller amounts of sample available for analysis, the sample required dilution. The detection limits were adjusted accordingly.
(37) Insufficient sample volume was collected for analysis. Field Parameters were not measured.
(38) Due to matrix interference 2x dilution factor required for VOCs. Arsenic MRL elevated due to matrix interference.
(39) Inadvertently, no sample was collected at this location.
(40) Due to dry conditions, sampling was not completed at this location.
